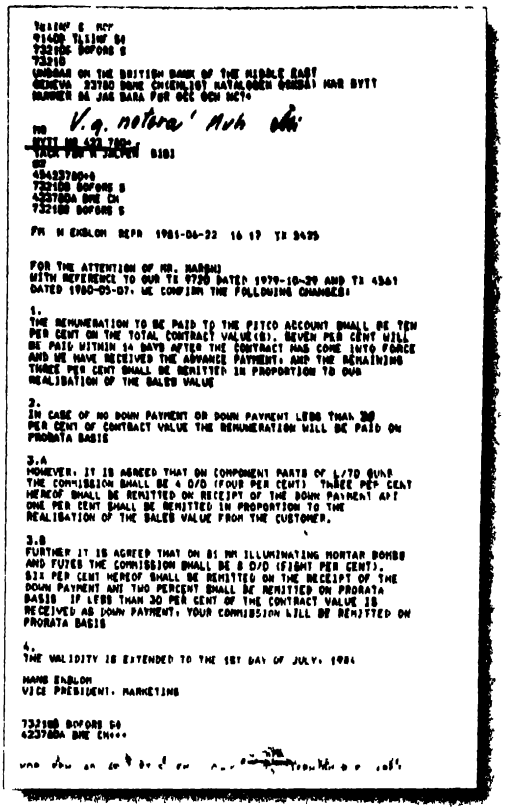
So squeaky clean did the Indian Government want to appear in the matter of defence deals that in October 1985 Prime Minister Rajiv Gandhi (according to a 1987 official communication from Bofors) "emphasised" in a New York meeting with Swedish Prime Minister Olof Palme that "Bofors should not utilise middlemen for the purpose of winning the contract".



The percentage-based "commissions" were subsequently declared by Bofors, when the storm over bribes broke out in Sweden and India, to be "winding up costs", that is, out-of-court settlements of contractual obligations. And this version was touchingly accepted by the Rajiv Gandhi government, even after the documentary evidence gained by *The Hindu* (from unimpeachable sources in Sweden) that demolished the "winding up" story continued to pile up.

WHO were the principal recipients of the Bofors payoffs? What is interesting is that the answer to this question furnished in 1988-89 by the journalistic investigation has been vindicated fully. The payment documents, read along with the relevant Ardbo diary entries and notes, have established the following. Win Chadha, the acknowledged Bofors "agent", and the Hindujas, who have always denied that they had anything to do with the Bofors-India howitzer deal, had to be paid as owners of older 'commission entitlements' (the Svenska-Chadha entitlement and the Pitco-Moresco-Hinduja entitlement) while the mysterious shell company, A.E. Services Ltd, was a new entrant that could not possibly have performed any service other than a politically corrupt one.

The 1987 diary and "daily notes" kept by Ardbo, the Bofors chief executive, offer dark hints about the involvement of Rajiv Gandhi ("R" of Ardbo's handwritten record), Olof Palme ("P"), Arun Nehru ("Nero" and "N"), the Hindujas (referred to variously as "Hanssons", "G.P.H.", "H", and "S.P.,G.P.", Ottavio Quattrocchi ("Q"), Bob Wilson ("Bob") and others involved in the affair.

Subsequently, it came to light in the Swiss legal and official process that the

(Above left) A bank document involving A.B. Bofors, Pitco, Sangam Ltd, Skandinaviska Enskilda Banken and Sveriges Riksbank, the Swedish Central Bank. It is an application for making a foreign exchange remittance, payable as "provision" (commission), to Pitco c/o Sangam Ltd, London, by Bofors. The document is dated November 17, 1982. (Above right) A telex message (TX 5425) of 1981 from Hans Ekblom, Vice-President, Marketing, A.B. Bofors, for the attention of "Mr. Marshi". It deals with "ten per cent of the total contract value(s) as the 'remuneration' to be paid to the Pitco account." The references are to Bofors' attempt to sell various items of military hardware to India.

seven appellants whose cases were dismissed by Switzerland's highest court, the Federal Court, in July 1993 were Gopichand Hinduja, Srichand Hinduja, Prakash Hinduja, Jubilee Finance Corporation, W.N. Chadha, Svenska Inc., and Quattrocchi. This revelation set the stage for the arrival of some 500 pages of Swiss bank documents and related papers containing explosive information on the recipients and the deep end of the payoffs.

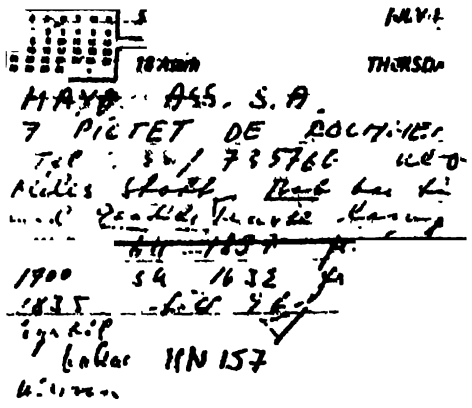
The bank documents relating to the three Hinduja brothers as recipients of Bofors payoffs are awaited. But so far as Chadha is concerned, the CBI investigation has nailed him as the person behind the Panama-based Svenska Inc., which received a payment of SEK 188.40 ($29.44 million) for the Bofors-India howitzer deal. The charge-sheet mentions that although Chadha denied "any connection with or even knowledge of Svenska Inc." before the Joint Parliamentary Committee and the Income Tax authorities, the investigation had established that Chadha had "full Power of Attorney with the fullest rights and power to substitute any one's else name in place of its own, to open and operate an account on behalf of M/s Svenska Inc." Furthermore, the investigation found that the Bofors payoffs were credited to Chadha's Account No. 99921-TU with the Swiss Bank Corporation, Geneva. Chadha, it turned out, had given full powers of Attorney for this account to his wife, Kanta W. Chadha, and his son, Hersh W. Chadha.

But the real investigative breakthrough relates to Quattrocchi, the 'Q' of the Ardbo diary, as the mover behind Bofors' payment to the shell company, A.E. Services Ltd. The Swiss bank documents, and the CBI's resourceful investigation of the neck-deep involvement of this "close family friend" of Rajiv Gandhi, have taken our knowledge of the powerful interest behind A.E. Services Ltd much beyond what the media investigation was able to discover in 1988-1990. In a sworn affidavit dated December 10, 1993, Myles Stott of A.E. Services Ltd disclosed that "the initial approach to me came from Ottavio Quattrocchi" and that "as a result of this approach, I requested R.A. W(ilson) to contact Ardbo". He added that "consequently, a contract was drawn up between A.E. Services and Bofors dated November 15, 1985". Stott also revealed that he received key transactional instructions from one S.I. Mubarak ("SIM"). "In August 1986 I was requested to open an account with Nordfinanz (NFZ) Bank in Zurich in the name of A.E. Services Ltd. On September 8, 1986, NFZ account was credited with a transfer made by Bofors of $7.3 million... SIM was informed of this receipt and instructed me to make various disbursements of which the largest sum... was to be made to Colbar Investments, a Panamanian company."

THE documents in the CBI's possession establish Quattrocchi's deep-end involvement in the Bofors corruption scandal. On September 3, 1986, Bofors remitted a sum of SEK 50.46 million ($7.34 million) to Account No. 18051-53 with Nordfinanz Bank, Zurich. In September 1986, amounts totalling $7.25 million were transferred out of this account into Account No. 254.561.60 W of M/s Colbar Investments Limited Inc., Panama with the Union Bank of Switzerland, Geneva. On July 25, 1988, an amount of $7.94 million was transferred out of the Colbar account to Account No. 488.320.60 X of M/s Wetelsen Overseas SA with the Union Bank of Switzerland, Geneva. On May 21, 1990, an amount of $9.20 million was transferred out of the Wetelsen account to Account No. 123983 of International Investments Development Co. with Ansbacher (CI) Limited, Guernsey, Channel Islands. Within ten days of its receipt in Guernsey, the amount of $9.20 million was channelled into various accounts in Switzerland and Austria.

Quattrocchi has maintained that he had "nothing to do with Bofors", that he did not receive any payment from Bofors, that he did not introduce Bofors to A.E. Services, and that he did not have "any connection with A.E. Services" ("Quattrocchi breaks his silence", cover story interview in *Outlook*, March 22, 1999). More surprisingly, on August 13, 1999, Sonia Gandhi felt confident enough to speak up for Quattrocchi at her first press conference: "The CBI has found him suspect. But we have not seen till today the papers that he has done something."

A devastating factual answer came within months in the CBI's charge-sheet. The criminal investigation has established beyond any dispute that Quattrocchi made "the initial approach" to Stott and that, in consequence, Bob Wilson contacted Ardbo, a contract, dated November 15, 1985, was drawn up between A.E. Services Ltd and Bofors, an account was opened for the shell company in Nordfinanz Bank, Bofors paid a hefty bribe into this account, and this money was subsequently channelled, in a chain of secret transactions in new places, to a very deep end. The CBI's investigation has also been able to establish that the Colbar and Wetelsen accounts into which the Bofors bribe was transferred were controlled by Ottavio and Maria Quattrocchi.



ANALYTICALLY, the Bofors-India kickback affair can be understood in terms of five modes of action. The first is the decision-making on the choice of howitzer. The second comprises the arrangements for the payoffs. The third is the cover-up and crisis management. The fourth is the journalistic investigation and expose. The fifth is the CBI's criminal investigation, assisted by the Swiss Federal Police and the Swiss courts, and prosecution before Judge Bharihoke's Special Court for CBI cases.

The first two modes of action – the process of decision-making and the related arrangements for secret payoffs into the Swiss bank accounts – constitute a set and belong squarely to the past. The three other modes of action – the cover-up and crisis management, the journalistic investigation, and the CBI's criminal investigation and prosecution – form the other set. They are still in progress, although the end of the road may not be too far away.

What is the hard information we have on the decision-making on the howitzer? The record available to the official investigation shows that from 1980 the Government of India was looking out for a state-of-the-art 155 mm howitzer system to meet defence operational requirements that were said to be urgent. The competition was short-listed in December 1982 to M/s Sofma of France, M/s A.B. Bofors of Sweden, M/s International Military Services of the United Kingdom, and M/s Voest Alpine of Austria. In November 1985, the Government of India's choice, based on advice from the Army Headquarters and a recommendation by the Negotiating Committee, narrowed down to Sofma and Bofors.

The official record also shows that between October 1982 and February 1986, the Indian Army did no fewer than seven evaluations of the relative merits of the howitzer systems offered by the bidders. In the first six, the Sofma 155 mm TR howitzer was clearly preferred to the Bofors gun. Financial considerations also gave the French manufacturer what looked like an unbeatable lead. However, it is now clear, Prime Minister Rajiv Gandhi and a small coterie that knew his thinking had made up their minds from the start to award the contract to the Swedish arms manufacturer and to no one else. Since they knew no way to make Army Headquarters

budge from its preference for the French gun, they patiently waited it out, notwithstanding the supposed urgency of the Army's strategic requirements. When General A.S. Vaidya's retirement neared and even before General K. Sundarji formally took over as Army chief, they moved swiftly to clinch the decision for Bofors. With Army Headquarters reversing in February 1986 a succession of earlier professional judgments that had gone against Bofors, the stages of final decision-making were telescoped and rushed through, resulting in the formalisation of the choice of Bofors on March 24, 1986. The CBI charge-sheet reveals, among other things, that after the Negotiating Committee recommended, on March 12, the issuance of a Letter of Intent to Bofors, the file was approved by five officials and three Ministers on March 13 and finally approved by Rajiv Gandhi on March 14.

In an entry for July 2, 1987, Martin Ardbo, the managing director of Bofors, records that the two directors of "AE Services" have met the "Gandhi Trust(e) lawyer" in Geneva. This diary entry was simultaneously reproduced in several newspapers, including *The Hindu*, *Indian Express* and *The Statesman*, on October 31, 1989.

The decision-making mode must now be related to the payments mode. The documents published by *The Hindu* established beyond the shadow of a doubt that secret payoffs totalling $50 million were made by Bofors to three or more recipient arrangements and that these payments, far from representing any "winding up costs", were percentage payments tied to specified supplies against the total order and to realisation of the payments by the Government of India. The media expose of the payoffs and some of the recipients appears to have had the beneficial effect of cutting off the payments. This by itself is significant. If the payments had been legitimate or legal, Bofors surely would not have had any difficulty in completing them as per the contracted 'entitlements'. However, Bofors' saving on the payoffs did not result in any lowering of the price of the howitzers for India.

BUT that is not all we now know about the payments mode. The CBI's investigation has nailed down the recipients of the bulk of the Bofors payments, and once the final set of bank documents reaches the CBI the Hinduja involvement as recipients of the Bofors payoffs will also be nailed down. We also know a good deal about the *modus operandi* employed, in an environment of secrecy, to protect the end-recipients. The very fact that the Swiss authorities and courts have, after looking into the requested bank documents, allowed the bulk of them to reach official Indian hands means that they are reasonably satisfied that bribes to Indian public servants are involved.

Cover-up of corruption in high places may be a natural response where the rule of law is not guaranteed in relation to the high and mighty; but what is understandable does not become legitimate under cover of realpolitik. This is what the Rajiv Gandhi dispensation and the Congress(I) learnt to their cost.

The line of dismissing the documented media allegations as "false, baseless and mischievous"; the repeated assertion that Bofors made no payments to "middlemen", to "agents", to "Indians", to Rajiv Gandhi or to anyone associated with his family; the soft approach, suggesting collusion, to the Hindujas, Chadha, Quattrocchi *et al*; getting the "Gandhi Truste(e) lawyer" to talk to Bob Wilson of A.E. Services Ltd at a time the Rajiv Gandhi dispensation had supposedly no knowledge of the existence of Bob Wilson or A.E. Services Ltd; Defence Secretary Bhatnagar's criminally culpable failure to act in the interest of the Indian Government and to avoid causing it wrongful loss and his attempt to shield Bofors from any sanction or pressure after the fact of illegal payoffs became known; fierce resistance from Rajiv Gandhi to any suggestion that the threat to cancel the contract should be used against Bofors to gain the full truth about the payments – all these are integral parts of the cover-up and crisis management mode.

CONSIDER the implications of the following pieces of the action detailed in the charge-sheet.

In April 1987, as soon as the Swedish media broadcast allegations about Bofors paying bribes to Indians, the Indian Ambassador to Sweden, B.M. Oza, pursued a no-nonsense line of pressing the Swedish government to investigate seriously into the allegations (rather than accepting Bofors denials at face value). But he learnt soon enough that Prime Minister Rajiv Gandhi did not want the truth to be revealed. The CBI's investigation has revealed that after receiving Bofors' letter of denial, dated April 24, 1987, as well as the views of Ambassador Oza, Rajiv Gandhi spoke to Swedish Prime Minister Carlsson and told him that in view of Bofors' letter of denial, there was no need for any further investigation of the allegations. This high-level message was, in fact, "just the contrary" of "what the Government of India had requested through official channels" and, not surprisingly, Ambassador Oza was "kept in the dark" about this development.

When, in consequence of Rajiv Gandhi's request to Carlsson, the Swedish government reversed its stand on an official investigation and announced that there would be no investigation, Ambassador Oza stubbornly persisted with his original demand – until Prime Minister Carlsson informed him about what Prime Minister Rajiv Gandhi actually wanted. The upshot was that Rajiv Gandhi was obliged to reverse his stand and send a letter, dated April 28, 1987, to Carlsson stating that "though facts furnished by Bofors tend to confirm the position that there were no middlemen, clarifications are necessary to set the controversy at rest" and that "in this context, the enquiry promised by the Swedish Government is of great importance". The consequence of Ambassador Oza's refusal to let the truth be buried was the enquiry by the Swedish National Audit Bureau that was to cause so much distress and trouble to Rajiv Gandhi and the recipients of the Bofors payoffs.

In June-July 1987, Prime Minister Rajiv Gandhi asked the Ministry of Defence for an evaluation of the cost to, and effect on, national security of the cancellation of the Bofors contract. Asked for his views on the subject, General Sundarji wrote a note, dated June 13, 1987, stating that obtaining complete information about the moneys paid by Bofors in connection with the contract was very essential and that, if Bofors did not part with the required information, "we should go to the

extent of threatening to cancel our contracts." He recommended that the Army could take a calculated risk: "In the interest of vindicating National Honour we apply full pressure on Bofors to part with the information needed for legal action against the culprits and accept the risk that this might in the worst case lead to a cancellation of the contract." Bhatnagar received General Sundarji's recommendation on June 13, 1987 and kept it to himself. A week later, he personally returned the note to the Army Chief, requesting him to change his recommendation regarding the cancellation of the contract. Sundarji refused to do so and reiterated his views in a note dated July 15, 1987. This document was also withheld from the man who was directly handling the matter, Minister of State in the Defence Ministry, Arun Singh.

Minister of State Arun Singh wrote a reasoned minute dated June 10, 1987, which was approved and endorsed by Defence Minister K.C. Pant. The minute argued that "we as GOI must pursue this matter to a logical conclusion." It specifically recommended that the Indian Ambassador in Sweden should be instructed to "inform both the Swedish Govt., and the company that unless they give us the information we want, we will have no alternative but to cancel the contract for the FH 77B 155 mm Howitzers."

Arun Singh's minute concluded: "I am fully cognisant of the fact that this cancellation will have some negative impact on our defence preparedness but you may like to reconfirm with COAS (Chief of Army Staff) whether we can live with that. In my view we must be prepared to go to this extent of cancellation because our very credibility as a Govt. is at stake and what is worse, the credibility of the entire process of defence acquisitions is also at stake. I would be most grateful if this note and the draft letters could be forwarded by you to the Prime Minister after you have seen them."

And what was Rajiv Gandhi's response to this reasoned suggestion endorsed by Defence Minister Pant? In a minute ostensibly dated June 15, 1987 (which appears to have been recorded later and antedated to cover up the Prime Minister's embarrassment over Arun Singh's resignation over the Bofors affair on July 18, 1987), he lashed out against his ex-friend:

"It is unfortunate that MOS/AS has put his [illegible]ige above the security of the nat[illegible]n before even evaluating all aspects. I appr[illegible]ate his feelings as he had been dealing with Def. almost completely on his own with my full support but that is not adequate reason to be ready to compromise the security of the nation. Has he evaluated the actual position *vis-a-vis* security? Has he evaluated the financial loss of a cancellation? Has he evaluated the degree of breach of contract by Bofors if any? Has he evaluated the consequences for all future defence purchases if we cancel a contract unilaterally? Has he evaluated how rival manufacturers will behave in the future? Has he evaluated how GOI prestige will plummet if we unilaterally cancel a contract that has not been violated? To the best of my belief the Swedish Audit report upholds GOI position and does not contradict it. What we need to do is to get to the roots and find out what precisely has been happening and who all are involved. Kneejerk reactions and stomach cramps will not serve any purpose. RRM has run the Ministry fairly well but there is no need to panic, specially if one's conscience is clear."

This minute is signed by Rajiv Gandhi. Can anyone reading this reaction of fury, along with the documented facts and circumstances of the Bofors case, arrive at a conclusion that this Prime Minister's conscience was clear?

But this is not all. Following an Arun Singh-guided effort in the Ministry of Defence to press Bofors to reveal the truth on pain of losing the contract, the Swedish side decided that Anders Carlberg, chairman of the Nobel group of industries, and two others would come to India on July 6, 1987 to reveal the truth confidentially to the Government of India. Meanwhile, Attorney-General Parasaran, whose advice had been sought, opined that Bofors had clearly breached the contract; this expert legal advice reached the Ministry of Defence on July 4, 1987. And what did Prime Minister Rajiv Gandhi do? He intervened officially to stop the Bofors team from coming to India with its dangerous information.

The crux of the case pressed in the CBI's charge-sheet is that public servants headed by Rajiv Gandhi, aided and abetted by various private individuals, were involved in a criminal conspiracy to cause "wrongful gain" to Bofors, Quattrocchi and Chadha and "corresponding loss" to the Government of India.

The criminal conspiracy involved several other offences. Covering up corruption is an extension of corruption and also amounts to obstructing justice. The chief players in the cover-up and crisis management that failed were Prime Minister Rajiv Gandhi, two Congress(I) governments, the Swedish Social-Democrat government, Bofors, Defence Secretary Bhatnagar, the Hindujas, Quattrocchi and Chadha.

The cover-up of the truth behind Bofors continued long after the death of Rajiv Gandhi. This unstated Congress(I) policy was reflected, in the post-Rajiv period, in the motivated internal decision to transfer K. Madhavan, the upright and independent CBI officer, from the case (October 1991); the transfer of Joint Director M.D. Sharma (February 1992); and various obstructive tactics and collusive proceedings that culminated in External Affairs Minister Madhavsinh Solanki's hard-to-believe act of malfeasance and political stupidity in Switzerland.

The main players in the investigation and expose of the Bofors corruption scandal have been Dagens Eko (the news service of Swedish Public Radio), sections of the Indian press, the Swedish police, the CBI when it has been allowed to do its job by its political masters, and the Swiss authorities. The leading contribution made by journalistic investigation to this case must be understood as a response to the challenge, an extraordinary attempt at cover-up and obstruction of justice. Had there been no cover-up of this kind, making a mockery of the rule of law and also professions of public morality in India as well as in Sweden, the role of the media in the investigation would have been far less important. *L'affaire* Bofors is an example of an issue where the relatively independent press, under the press of circumstances, performs better than most other institutions in society. The CBI, under independent professional leadership, has demonstrated in the recent past that it can do as well as any criminal investigation agency anywhere in the world.

BOFORS is independent India's most important corruption scandal. It might have had its ups and downs, its ebb and flow, in the public mind. But unlike previous corruption scandals, it has refused to go away as a national issue because the political, moral and systemic issues it raises are both deep-seated and dramatic. The distinction of Bofors has been to serve over more than a decade as a continuous symbol and metaphor for political corruption at the top. It has served to raise public consciousness against corruption in a way previous scandals put together failed to do. It has also helped us gain a larger and more reliable perspective about how various institutions perform in relation to corruption. It is important for the health of the Indian political system to ensure that the lawful attempt to uncover the full truth and make an example of the corrupt succeeds. ■

For something as special as your home, you need the services of an expert.

- 18-year low interest rate
- Low property prices
- Handsome Tax Benefits

A Home Loan is a lot more than just a housing loan. It's all about interacting with customers, patiently listening to them, understanding their needs and concerns and then offering a housing loan that suits their needs perfectly.

For over twenty years, HDFC has been doing this... and enjoying every moment of it. A fact that is reflected in its large customer base.

When you visit us, HDFC's counsellor guides you carefully on the property market and offers sound and honest advice in terms of location, budgets and time frames. Also, HDFC's low interest rates (lowest in 18 years), quick processing and special working hours in several branches make our loans that much more attractive and convenient for you.

You will see it's all about commitment, and it pays to consult an expert. More than a million satisfied customers will vouch for that.

Visit your nearest HDFC office.

The Svenska-Win Chadha track: What *The Hindu* documents establish

	Document date (Date of publication of document in *The Hindu*)	Nature of document	What the document reveals
1	21-12-78/24-10-78 (22-6-88)	Representation Agreement between AB Bofors, Sweden, and Anatronic General Corporation, India, signed by Hans Ekblom for Bofors and W N Chadha, President, Anatronic	Bofors appoints Anatronic as its sole representative in India to promote the sales of ordnance to the government authorities It specifies activities for the representative including obtaining information on the developments with respect to defence and defence procurements, and maintaining contact with defence industries It also requires Anatronic "to keep Bofors informed about the defence organisation in order to ascertain what persons currently have influential positions, and to try to judge who will have influence in the near future " It provides for, among other payments, commission of 2 per cent of the invoiced ex-works value on orders for ordnance Valid until 30-9-81
2	21-12-78/14-12-78 (22-6-88)	Agreement between AB Bofors, Sweden, and Svenska Inc , Panama, signed by Hans Ekblom for Bofors	Bofors appoints Svenska as Bofors' Consultant and Advisor for India, Nepal and Sri Lanka to promote the sale of Bofors ordnance The consultant is entitled to, among other payments, a commission of 4 per cent of the invoiced ex-works value on orders for ordnance In contrast to the Bofors-Anatronic agreement, no activities are specified for Svenska Valid until 30-9-81
3	11-3-81 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Svenska Inc	Extends the validity of (2) until 30-9-84
4	11-3-81 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Anatronic (Win Chadha)	Extends the validity of (1) until 30-9-84
5	13-1-82 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Svenska Inc	*Inter alia* this document raises the commission to 6 per cent
6	30-11-82 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Svenska Inc	Validity of (2) extended until 30-9-87 in respect of Bofors FH 77B weapon system Commission 6 per cent
7	3-2-83/30-11-82 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Anatronic (Win Chadha)	Validity of (1) extended until 30-9-87 in respect of Bofors FH 77B weapon system No change in commission specified earlier
8	30-11-82 (25-11-88)	Separate Agreement between AB Bofors and Svenska Inc	This is for the special promotion of sales of the FH 77B weapon system in India No change in commission
9	6-3-84 (25-11-88)	Agreement appointing Svenska as Bofors' Consultant and Advisor for India, Nepal and Sri Lanka	This is for the promotion of Bofors ordnance and ordnance stores in India, Nepal and Sri Lanka either directly or through Bofors' sole representative in the Territory Provides for a commission of 5 per cent of the invoiced ex-works value of the contract
10	15-3-84 (25-11-88)	Separate Agreement between AB Bofors and Svenska Inc	This is for the special promotion of sales of the FH 77B weapon system in India Payment of commission made "subject to Svenska or the Bofors' sole representative in the Territory giving us satisfactory confirmation that the order is a result of your efforts " Commission 6 per cent

The Svenska-Win Chadha track: What *The Hindu* documents establish

	Document date (Date of publication of document in *The Hindu*)	Nature of document	What the document reveals
11	10-5-84/29-5-84 (28-6-88)	Agreement between Bofors and Svenska signed by Bofors (Hans Ekblom) and Svenska Inc	Bofors appoints Svenska as Consultant and Advisor for India, Nepal and Sri Lanka to promote the sale of Bofors ordnance The FH 77B weapon system is not explicitly mentioned It specifies, among other payments, a commission of 5 per cent of the ex-works value of orders for ordnance
12	22-8-84 (25-11-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Svenska Inc	Commission in (11) raised by 2 percentage points for orders of mortar flare bombs
13	19-9-84 (28-6-88)	Letter on the Bofors letterhead signed by representatives of Bofors (Hans Ekblom) and Svenska Inc	Raises the commission stipulated in (11 and 12) by 0 75 percentage points
14	10-5-84/30-11-84 (25-11-88)	Representation Agreement between Bofors and Anatronic	Bofors appoints Anatronic as its sole representative in India to promote the sale of Bofors ordnance
15	2-1-86/13-1-86 (22-6-88)	Agreement between Bofors and Svenska signed by Bofors (Hans Ekblom) and Svenska Inc. Note: Antedated document; described in the CBI's FIR as "forged and dishonestly and fraudulently made "	Bofors appoints Svenska to promote the sale of Bofors ordnance and ordnance stores to the government authorities Commission due to the Consultant for the supply contract for Bofors 155mm field howitzer system *signed on March 24,1986*, specified as 2.24 per cent of the total ex-works value when the advance payment is received by Bofors and 0 96 per cent of the ex-works value to be paid pro-rata when payment for deliveries has been received by Bofors. The internal inconsistency with respect to dates shows that the document its fabricated.
16	13-1-86 (22-6-88)	Agreement between Bofors and Anatronic signed by Hans Ekblom and Win Chadha	Appoints Anatronic as Administrative Consultant "to be responsible for supply of administrative services to Bofors liaison office " Remuneration specified as SEK 100,000 per month from January 1, 1986
17	27-2-86 (23-6-88)	Credit note for Swedish kronor (SEK) 135,654 from Bofors to Svenska Inc , Panama	Specifies that this commission is paid on material supplied to the Indian High Commission, London Specifies that this is a 6 per cent commission on SEK 2,259,400
18	24-3-86 (22-6-88)	Credit note for SEK 422,909 40 from Bofors to Svenska Inc., Panama	Specifies that this commission is on material supplied to the Government of India Specifies that this is a 6 per cent commission on SEK 7,048,490
19	5-5-86 (23-6-88)	Statement from Bofors books	Specifies a commission payment of SEK 188,398,806 to Svenska account in Swiss Bank Corporation, Geneva
20	5-5-86 (23-6-88)	SEB debit advice document	Specifies payment of SEK 113,039,283 64 (US $16,070,412 80) by Bofors to Svenska account in Societe de Banque Suisse
21	21-1-87 (23-6-88)	Credit note for SEK 283,751 40 from Bofors to Svenska Inc account in Swiss Bank Corporation, Geneva	Specifies that this is a 6 per cent commission on SEK 4,729,190.
22	12-2-87 (23-6-88)	SEB document	Bofors' instruction for payment CHF (Swiss francs) 415,428 to Svenska account in Swiss Bank Corporation, Geneva.

The Svenska-Win Chadha track: What *The Hindu* documents establish

	Document date (Date of publication of document in *The Hindu*)	Nature of document	What the document reveals
23	25-2-87 (23-6-88)	Credit note for the payment of SEK 639,908 75 to Svenska Inc account in Swiss Bank Corporation, Geneva.	Specifies that this is a 0 96 per cent commission on material supplied to Secretary to the Government of India, Ministry of Defence
24	11-3-87 (23-6-88)	Credit note for the payment of SEK 469,864 66 to Svenska Inc	Specifies that this is a 0.96 per cent commission on material supplied to Secretary to the Government of India, Ministry of Defence.
25	24-3-87 (23-6-88)	Credit note for the payment of SEK 686,095 76 to Svenska Inc	Specifies that this is a 0 96 per cent commission on material supplied to Secretary to the Government of India, Ministry of Defence
26	30-3-87 (23-6-88)	Credit note for the payment of SEK 264,456 18 to Svenska Inc	Specifies that this is a 0 96 per cent commission on material supplied to Secretary to the Government of India, Ministry of Defence
27	5-5-87 (22-6-88)	Letter from President of Svenska Inc to AB Bofors marked "Personal" and "Attention: Mr. Thomas Eldh"	Refers to (15) and says that in response to the "request of the Indian Government to Bofors not to use any middlemen", it was mutually agreed that the 2.24 per cent remuneration paid in May 1986 was to be treated as "the termination charges for the termination of the agreement relating to the FH 77B system" It also specifies that the second part of the remuneration (0 96 per cent) was "intended to be for the consultancy services during the life of the contract "

The Pitco-Moresco-'Moineao'-Hinduja track: What *The Hindu* documents establish

1	19-10-79 (22-4-88)	Communication from the AB Bofors Ordnance Division to the British Bank of the Middle East, Geneva, marked for the attention of "Mr. Marshi".	It records that Bofors has "agreed irrevocably to remit to the Pitco account with your bank" 8 per cent of the total value of a contract "to be signed within 12 months" between AB Bofors and the Government of India for the procurement of FH77 howitzers and other items.
2	22-8-81 (22-4-88)	Telex message (TX5425) from Hans Eldblom, Vice President, Marketing, AB Bofors, for the attention of "Mr. E. Marshi", the British Bank of the Middle East, Geneva.	Records changes in remuneration to be paid to "the Pitco account"; remuneration "shall be 10 per cent on the total contract value(s)" Refers specifically to L-70 guns and 81 mm illuminating mortar bombs and fuses.
3	4-3-82 (22-4-88)	Application for making a foreign exchange remittance payable by Bofors as "provision" ("commission") to Pitco c/o G.P. Hinduja, Sangam Ltd., London.	The bank document involves AB Bofors, Pitco, Sangam, G.P Hinduja, SEB and SR. Pre-howitzer payment.
4	17-11-82 (22-4-88)	Application for making a foreign exchange remittance payable by Bofors as "provision" to Pitco, c/o Sangam Ltd., London.	The document involves AB Bofors, Pitco, Sangam, SEB and SR. Pre-howitzer payment.
5	Jan, 1984 (25-6-88)	Internal document of SR. A computer printout of a monthly statement of transactions involving foreign exchange.	On January 10, 1984, a commission payment (coded "62", that is, a commission) of Swedish Kronor (SEK) 174,522 was made to Pitco, c/o Sangam Ltd. Pre-howitzer payment.

	Document date (Date of publication of document in *The Hindu*)	Nature of document	What the document reveals
6	29-6-84 (22-4-88)	Communication from Hans Ekblom to "M/s. Moresco", c/o Continental Illinois Bank, Geneva, and marked for the attention of "Mr. Marshi".	It makes a reference to Bofors' attempt to sell the FH 77B to India, and to the 22-6-81 telex message (which in turn refers to the Pitco account). The "remuneration" is reduced from 10 per cent to 8 per cent of the contract value.
7	27-12-85 (27-4-88)	"Settlement agreement", signed at Karlskoga, between Bofors and "Moineao S.A.", described as "a Strategic Consultant Company". Note: Antedated document; fabricated agreement.	It "cancels" an "earlier agreement between the parties". Under the "settlement agreement", Bofors agreed to pay a "cancellation fee" of SEK 80 million.
8	20-5-86 (23-6-88)	Credit note for SEK 11,774,925 from Bofors to Credit Suisse, Geneva.	"Commission" paid into the coded account 'Mont Blanc'.
9	21-5-86 (23-6-88)	The corresponding debit advice in SEB's records.	
10	1-7-86 (23-6-88)	Credit note for SEK 8,410,661 from Bofors to Manufacturers Hannover Trust Company New York, Geneva.	"Commission" paid into the coded account 'Tulip'.*
11	2-7-86 (23-6-88)	SEB remittance document to Manufacturers Hannover Trust Company New York, Geneva.	Payment (coded "62") from Bofors to 'Tulip' with a request that the sender's name not be mentioned.
12	18-2-86 (23-6-88)	Credit note for SEK 1,092,697.28 from Bofors to Suisse Bank Corporation, Geneva.	Quarterly commission paid into the coded account 'Lotus'.*
13	18-12-86 (22-6-88)	Credit note for SEK 854,943.37 from Bofors to Suisse Bank Corporation, Geneva.	Quarterly commission paid into 'Lotus'.*
14	18-12-86 (23-6-88)	Credit note for SEK 1,092,697.28 from Bofors to Manufacturers Hannover Trust Company New York, Geneva.	Quarterly commission paid into 'Tulip'.*
15	18-12-86 (23-6-88)	Similar credit note for SEK 578,832.06	Quarterly commission paid into 'Tulip'.*
16	22-12-86 (23-6-88)	Foreign exchange remittance instruction from SEB to Suisse Bank Corporation, Geneva, for SEK 2,550,879.96.	Paid into 'Lotus'.
17	No date (23-6-88)	Bofors internal note, listing the percentages in respect of 'Tulip' (40 per cent), 'Lotus' (25 per cent) and 'Mont Blanc' (35 per cent).	It lists the proportion in which payments were made into 'Tulip', 'Lotus' and 'Mont Blanc'.

SEB: Skandinaviska Enskilda Banken, in which Bofors maintained an account; SR: Sveriges Riksbank, the Swedish central bank.
* These documents specified that the sender's name not be mentioned.

The A.E. Services track: What *The Hindu* documents establish

	Document date (Date of publication of document in *The Hindu*)	Nature of document	What the document reveals
1	15-11-85 (22-6-88)	Agreement between AB Bofors and A.E. Services signed by Martin Ardbo, President, AB Bofors, and R.A. Wilson, Director, A.E. Services. Note: The CBI's FIR confirmed that Bofors had "falsely claimed" that this agreement of 15-11-85 was cancelled "effectively on 5th March 1986".	The agreement appoints A.E. Services as consultant in connection with services related to the "possible award" to the company of a contract to provide 155 mm howitzers to the Ministry of Defence, GOI. Specifies that in the event that the client awards the contract and the contract becomes effective – "but only then and not otherwise" – A.E. Services would be paid 3 per cent of the total contract value. Specifies that if the contract was not awarded to the company by the Government of India before April 1, 1986, the Agreement would cease to have effect.
2	8-8-86 (22-6-88)	Covering letter from A.E. Services (dictated by Myles Stott, signed in his absence) to Martin Ardbo.	The covering letter encloses "a completed copy of the Agreement of 15th November 1985, which cancels and replaces the original agreement which was incomplete." The letterhead described A.E. Services Ltd as "PROJECT MANAGEMENT AND CONSULTING SERVICES FOR ENTERPRISES OUTSIDE THE U.K." This letter is evidence that (1) was still in force on 8-8-86 and was not cancelled "effectively on 5th March 1986", as claimed by Bofors.
3	27-8-86 (22-6-88)	Telex message from A.E. Services, marked "Attention: Martin Ardbo".	Specifies that a payment of Swedish kronor (SEK) 50,463,966 be made into the Nordfinanz Bank, Zurich.
4	2-9-86 (22-6-88)	Payment document from AB Bofors to A.E. Services.	Specifies that a commission payment of SEK 50,463,966 be made into A.E. Services' account in Nordfinanz Bank, Zurich.
5	3-9-86 (23-6-88)	Payment document coded "62" from AB Bofors to A.E. Services.	Specifies that a commission payment of SEK 50,463,966 be made from SEB into A.E. Services' account in Nordfinanz Bank, Zurich.

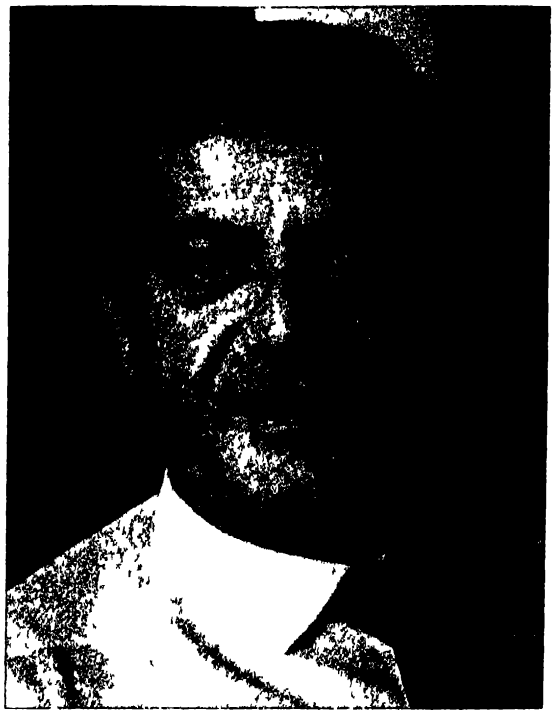
Table compiled by Ashok Krishnaswamy, V. Venkatesan, N. Ram and V. K. Ramachandran.

SUDHA MAHALINGAM

THE Quattrocchi connection in the Bofors scandal, which became obvious after the Swiss Government released the names of the appellants in 1993, figured in a Central Bureau of Investigation (CBI) letter to the Swiss authorities as early as 1990, but only by chance. In January 1990, soon after the first information report (FIR) was filed, K. Madhavan, then Joint Director in the CBI, Arun Jaitley, the then Additional Solicitor-General (now Union Minister for Information and Broadcasting), and Bhure Lal, then a Joint Secretary in the Prime Minister's Office (PMO), were in Berne, carrying a letter from the CBI Director addressed to Pierre Schmid, the Vice-Director of the Swiss Department of Justice. This letter had sought to freeze certain accounts into which Bofors had deposited the commissions. The names of the accounts had been unearthed by *The Hindu*'s investigation. The name of Ottavio Quattrocchi did not figure in the CBI's list of suspected recipients yet.

On the night of January 25, while they were still in Switzerland, the Indian officials learnt of yet another account into which money had been deposited. Thereupon they drew up another list of possible recipients of money from this account along with a supplementary letter requesting a freeze on that account too. Quattrocchi's name first figured in this list, along with a few other names.

According to the charge-sheet now filed by the CBI, Quattrocchi was in India for almost 28 years – between 1964 and 1993 with a two-year break in between. During much of this period, he had unrestricted access to the prime ministerial residence at Race Course Road and the PMO in South Block. If Congress(I) spokesperson Kapil Sibal had cared to take a look at the security agencies' logbooks in the Prime Minister's residence and office, he would not have made the statement that Rajiv Gandhi had no connection with the Quattrocchis.



Quattrocchi's clout in the rarefied levels of government was legendary. Some of those who were in senior positions in the bureaucracy during Rajiv Gandhi's premiership say that he dropped names unabashedly, walked into Ministers' and Secretaries' offices without prior appointment, and at times even waited outside the venue of Cabinet meetings just in case his presence was needed to clarify a point or make a presentation. Senior bureaucrats who served during the 1980s remember sighting him in the company of Ministers and top bureaucrats. Quattrocchi was generous to those who promoted the interests of his company and vindictive towards those who did not, they say. According to them, officials who resisted the persuasive charms of the Italian businessman often found themselves unceremoniously transferred out or forced to go on leave, sometimes even resign,

The 'Q' connection

With the Indian authorities issuing a non-bailable warrant for his arrest, Ottavio Quattrocchi may well have his back to the wall.

while those who obliged him were favoured with plum postings. Quattrocchi and his wife Maria threw lavish parties in New Delhi, which were attended by the powerful and the influential.

A retired bureaucrat told *Frontline* that queries he had raised on a certain project for which Snamprogetti (the company that Quattrocchi represented in India) had bid were answered point by point by Quattrocchi the next day when he dropped in on the former. "How Quattrocchi got to know what points I had raised in my confidential note to the Minister is something that still mystifies me," he said. Informed sources also say that it was not unusual for Quattrocchi to have access to confidential information sent to the PMO. A retired bureaucrat told *Frontline* that not only did Quattrocchi drop in at his office periodically to lobby for his projects, but soon after his visit there would be calls from two senior Congress(I) functionaries (whom the sources named) inquiring about the fate of those projects.

Ottavio Quattrocchi.

However, Quattrocchi's clout in the PMO appears to have predated Rajiv Gandhi's prime ministership although it did peak during his tenure. Snamprogetti licensed the technology for fertilizer plants worldwide, supplied certain proprietary equipment and executed engineering, procurement and construction (EPC) contracts on a turnkey basis. The first Indian fertilizer projects executed by Snamprogetti during Quattrocchi's tenure were the Indian Farmers Fertilizer Cooperative's (IFFCO) Phulpur plant with a urea capacity of 1,550 tonnes a day (mtd), four plants of KRIBHCO at Hazira, each with a capacity of 1,100 mtd, and the Trombay V and the Thal Vaishet plants of Rashtriya Chemicals and Fertilizers Limited.

All these were awarded to Snamprogetti during Indira Gandhi's prime ministership and were commissioned between 1975 and 1986. Interestingly, Haldor-Topsoe, a Danish firm, was originally selected to set up the Hazira plant, but the contract went to Snamprogetti eventually. The World Bank, which financed the project, withdrew its support to the project because of certain irregularities in the award of the contract, but the Government went ahead and found other sources of financing the project rather than drop Snamprogetti.

Snamprogetti hit the jackpot when all the 10 plants (including two expansion projects) to be fed by natural gas from the HBJ (Hajira-Bijaipur-Jagdishpur) pipeline came its way during the mid-1980s. While only a few of them were public sector plants and the rest were put up by the private sector, all of them depended on gas to be supplied by the public sector Gas Authority of India Limited (GAIL) from Bombay High through the HBJ pipeline. It is anybody's guess how much leverage the Government would have enjoyed in the choice of technology. Fertilizer industry sources say that at that time a conscious decision was taken to maintain uniformity in technology deployed in all the gas-based urea plants supplied by the HBJ pipeline and therefore Snamprogetti became the chosen technology licensor and EPC contractor for all the projects. However, the sources added that Snamprogetti's technology was among the best available at that time, although they were not sure that their prices were among the lowest.

There was one prized project that Snamprogetti failed to win despite hectic lobbying. This was the Rs.680-crore HBJ pipeline project that was to ferry gas from Bombay High over 1,700 km, traversing the States of Gujarat, Madhya Pradesh, Rajasthan and Uttar Pradesh. Three parties had been shortlisted for the project after competitive bidding - the French firm Spiecabag, Snamprogetti, and a Japanese firm. The French firm had quoted a sum of Rs.150 crores lower than Snamprogetti and was the front-runner. Quattrocchi lobbied furiously for Snamprogetti to be given the contract and went even to the extent of suggesting that the French and Japanese firms be disqualified on technical grounds. But G.V. Ramakrishna, the then Petroleum Secretary, stood his ground and decided to award the contract to the French. Quattrocchi then got a committee (headed by Kaul) set up to review the award. But the Kaul Committee upheld Ramakrishna's award. That Ramakrishna managed to get the French firm to reduce the quoted price by another Rs.34 crores is a little-known fact.

Quattrocchi appears to have had the Midas touch even in Malaysia where he currently heads Snamprogetti's Asia-Pacific Operations in Kuala Lumpur. In 1997-98 alone he is reported to have clinched 17 major petroleum and oil projects for Snamprogetti. However, in Italy some of the individuals and organisations Quattrocchi had been associated with are learnt to be facing corruption charges, rendering it dicey for him to try to return home. With the Indian authorities issuing a non-bailable warrant for his arrest, and with Interpol having issued an alert earlier, Quattrocchi may well have his back to the wall. ■

KILLER CYCLONE

A 'super cyclone' leaves death and destruction in its trail over large parts of coastal Orissa.

SUHRID SHANKAR CHATTOPADHYAY
in Orissa

NEVER before had Orissa experienced such a violent churning. The "super cyclonic storm" tore through the coastal districts on the morning of October 29 with a wind velocity of between 260 and 300 km an hour, and within hours the region was under several feet of water.

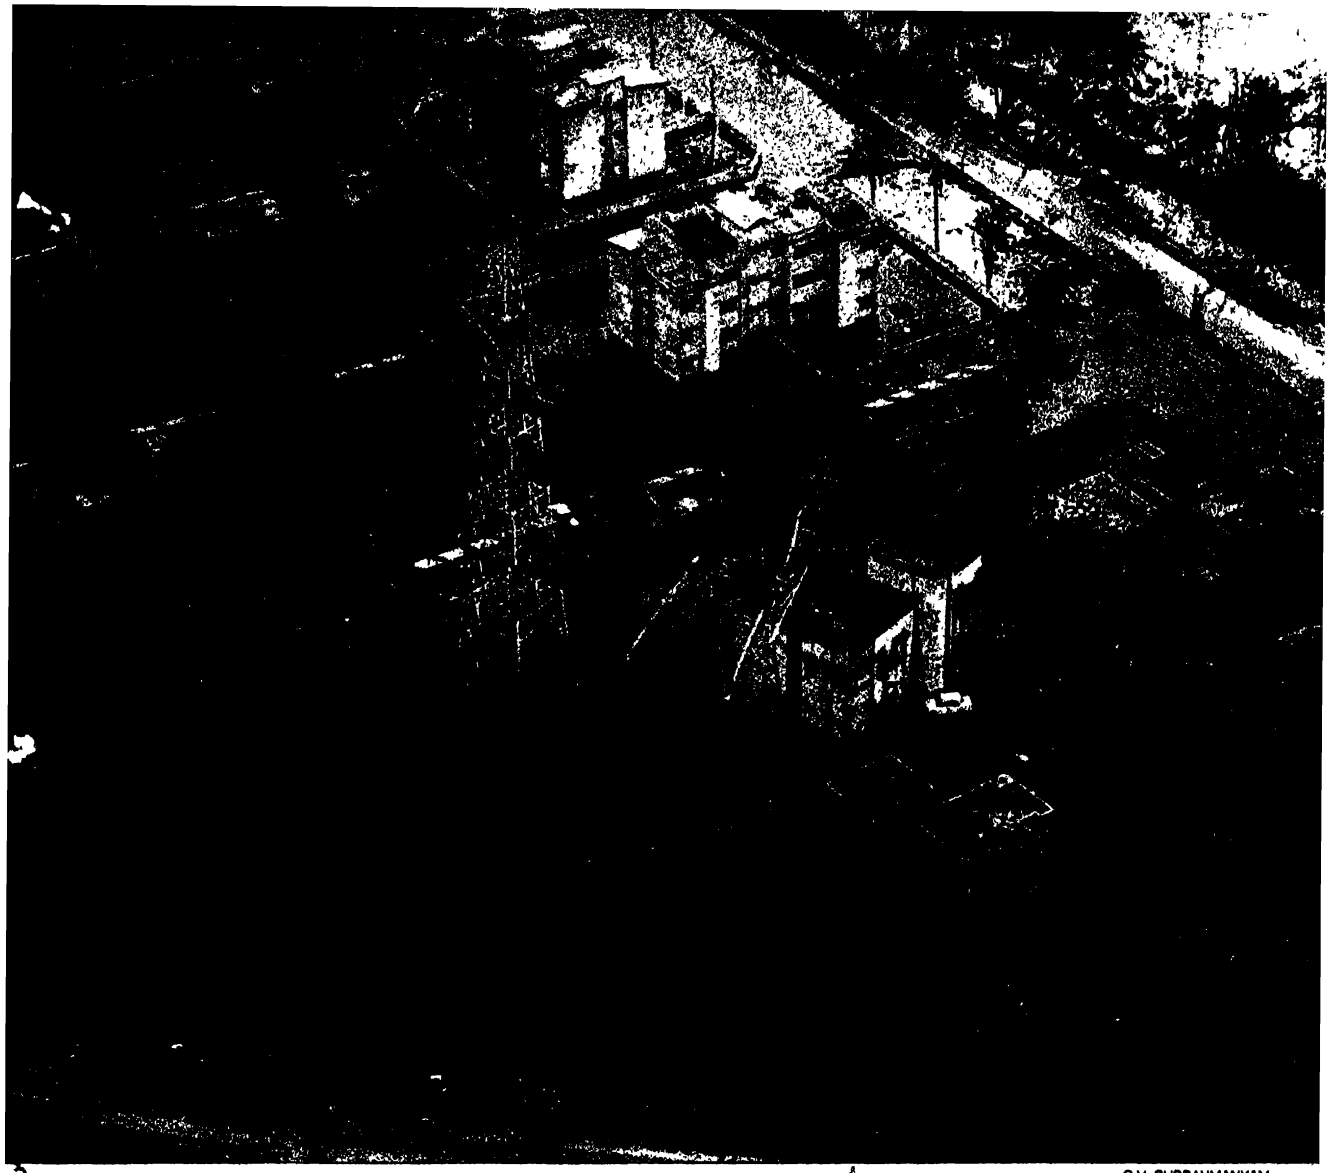
Within 48 hours, it was death and devastation all over the districts of Jagatsinghpur, Kendrapara, Jajpur, Cuttack, Bhadrak, Balasore, Puri, Bhubaneswar and Khurda. The casualties included thousands of human lives and tens of thousands of head of cattle. All forms of communications were disrupted, and Orissa remained largely cut off from the rest of the country.

The storm, which slammed the Paradeep coast at 3 a.m. after ferociously swirling over the Bay of Bengal, was the second one to hit the State in a span of two weeks. Ganjam district was battered by a storm with a wind speed of 180 km an hour on October 17.

Paradeep Port Trust officials and the Jagatsinghpur district administration had sounded a red alert on October 28, warning of an impending cyclone of great intensity, which at that time lay centred 180 km southeast of Paradeep. Warnings were issued also to the administrations of the districts of Ganjam, Gajapati, Nayagarh, Puri, Khurda, Cuttack, Kendrapara, Jagatsinghpur, Bhadrak and Balasore. The State government had instructed the administrations to evacuate people and stock relief materials. The Army's 120 Infantry Battalion had also been put on alert.

Despite all these, the government had no idea of the enormity of the crisis on hand. The authorities were aware that a cyclone had struck Paradeep but did not immediately know that tidal waves, rising up to 12 metres, had submerged several areas in Jagatsinghpur and Kendrapara districts. The storm lasted 34 hours.

The earlier devastation caused to Ganjam district appeared negligible in comparison to the blow the "super cyclone" dealt. According to unofficial reports, at least 5,000 people have been killed in Paradeep alone. Whereas the Divisional Commissioner's office estimated the property loss in Ganjam at Rs.1,000 crores. Chief Minister Giridhar Gamang put the damage caused by the "super cyclone" at Rs.1,000,000 crores. In Ganjam, the cyclone and the rain that accompanied it paralysed the Gopalpur port, affected two million people in 18 blocks and damaged 1,500 villages. The "super cyclone" destroyed 25,000 houses in Gajapati, Khurda, Puri, Cuttack, Jagatsinghpur, Kendrapara, Bhadrak and Balasore districts.



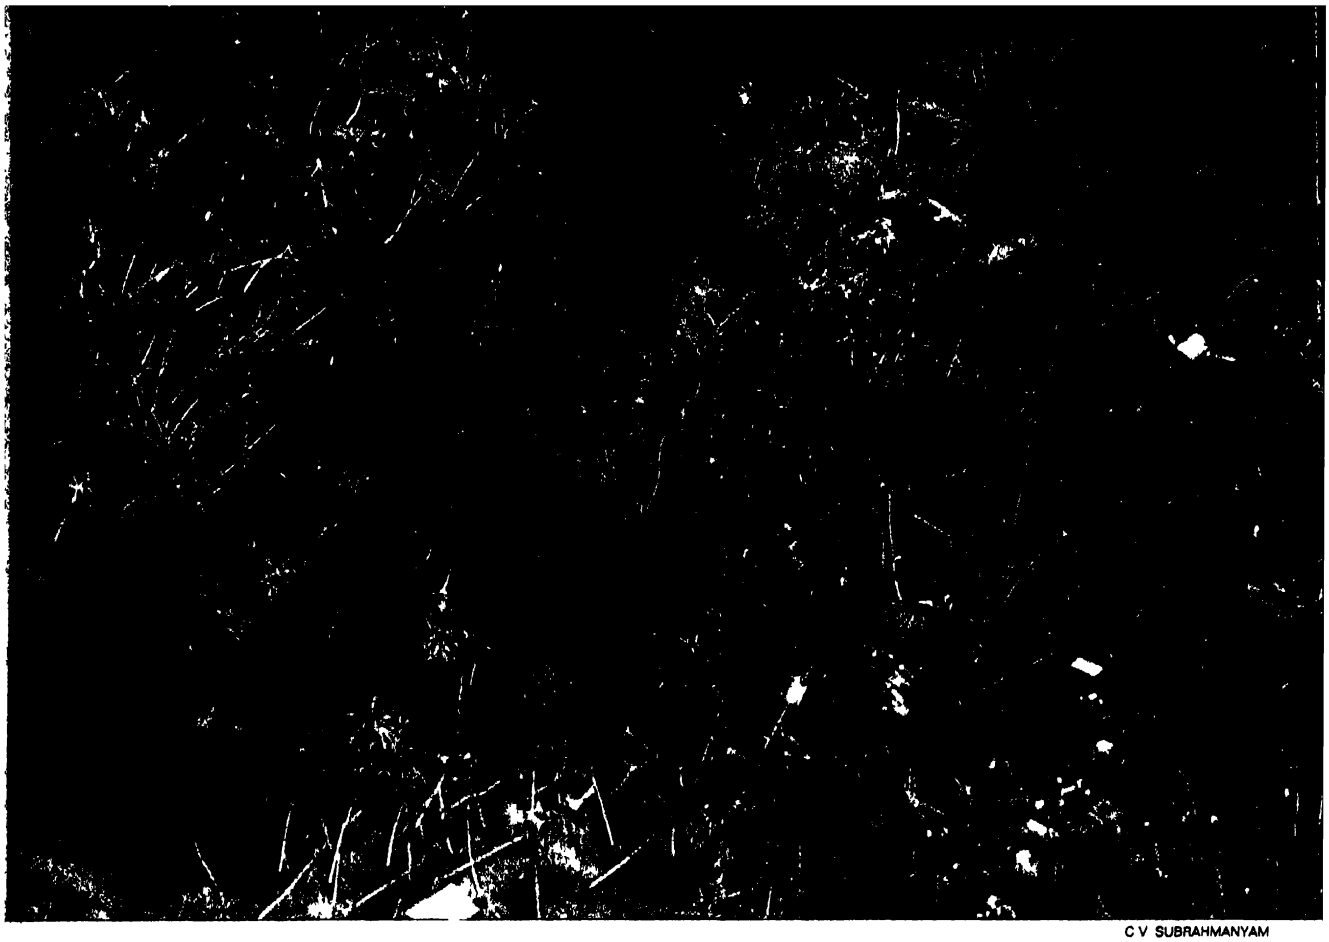
GIRIDHAR GAMANG and Revenue Minister Jagannath Patnaik undertook an aerial survey of the affected areas. Patnaik, who personally oversaw the relief operations in some areas, told *Frontline*: "Such large-scale devastation has never been witnessed before in the whole of India. The cyclone has affected over two crore people and destroyed 30 lakh *kutcha* houses, rendering millions of people homeless. Roofs made of asbestos, tin sheets and tiles have been blown off. All agricultural land has gone under water, and saline water has entered the fields in many areas. In the marine belt, the prawn and fishing industry has collapsed."

Gamang told *Frontline*: "The loss of cattle has been enormous. I saw the devastation from the helicopter." The State government on November 5, submitted a report to the Centre seeking a preliminary assistance of Rs.2,500 crores for rebuilding the socio-economic and administrative infrastructure. The total cost of this is projected at Rs.10,000 crores.

TENS of thousands of people camped on highways (two National Highways had breached, affecting road traffic) and rail bridges. Railway tracks in several places had been uprooted or washed away. Uprooted trees blocked all land approaches to the affected areas. Road links to Jagatsinghpur, Kendrapara, Jajpur and Bhadrak districts were cut off. Only wireless communication was possible to Kendrapara and Jagatsinghpur. Jagatsinghpur suffered extensive damage as sea water overwhelmed vast areas. The spectre of epidemics loomed over the district, as five lakh people lived in the marooned villages amidst decomposed bodies and carcasses.

In Paradeep, villagers and also Central Industrial Security Force (CISF) jawans

Paradeep township and (right) the port, which bore the brunt of the cyclone that slammed the coast on October 29 with a wind velocity of 260 to 300 km per hour. (Far right) Railway tracks twisted out of shape by the impact of the cyclone and the torrential rain that accompanied it. Many passengers were stranded after rail links were cut off.



C.V SUBRAHMANYAM

SUSHANTO PATRONOBISH

C V SUBRAHMANYAM

An aerial view of a village which was destroyed completely near Berhampur.

posted in Paradeep Phosphate Ltd claimed that the human toll in the region would be not less than 8,000. (Unofficial reports have put the toll in Paradeep at 15,000. The official figure, however, stands at 1,381.)

Several tugs and trawlers sank off the Paradeep port. Tiny villages along the coast have been turned into lakes, blotting out all signs of human inhabitation. The entire Paradeep region was under water. Debris of houses were found floating in the water. Bodies were found trapped under the debris. As the waters began to recede, the stench of putrefied bodies and carcasses pervaded the air. The Paradeep creek reeked with bloated bodies. Earthmovers and dumpers scooped them up, while Port Trust workers cremated them. The survivors, meanwhile, looked around frantically for food.

The PPL itself is facing a crisis. R.C. Mo[illegible], Plant Manager, told *Frontline* that at le[illegible] Rs.100 crores would be required to co[illegible] the cost of damage caused to property and machinery. Power supply to the affected areas was disconnected. R.K. Das, PPL's Regional Director, said: "The Air Force provided two generators that served only 10 per cent of the premises. We need an 11-kv generator of 1.2 to 2 MW capacity to control the pressure in the ammonia tank in normal conditions. In view of the atmospheric condition, we release small amounts of ammonia into the air."

A body being loaded on to a dumper near Paradeep.

Das said that the situation at PPL was grim. "Our hospital is filled with outsiders who have sought shelter. I am fighting an epidemic here. As it is we have to feed 2,700 people (PPL workers and their families) and on top of that 5,000 outsiders have entered the premises. They snatch whatever food is brought for us. If food is brought via road, villagers rob the vehicles."

Along the 150-km stretch between Paradeep and Bhubaneswar, hundreds of people waited for an occasional vehicle coming that way with food. Uprooted trees and electricity and telegraph poles lined the entire stretch.

The silver city of Cuttack, which was under knee-deep water, suffered because of its basin-like topography. The city could not discharge the run-off rain water as the two rivers that flanked it had reached the danger level. It was plunged into darkness, with the electricity supply disrupted. Large areas of Cuttack district remained inaccessible even seven days after the storm crossed the coast, with blocks such as Niali-Kantapara, Govindpur, Baranga, Banki, Yigiria, Athgarh, Mahanga, Salepur and Nischintkoli still flooded. The toll in the district is expected to be around 300. An epidemic broke out in Govindpur.

Cuttack was luckier than Kendrapara district. From 500 metres above ground level, it appeared like a cluster of islands.

■ DISASTER

Reaching relief

The Army, the Air Force and the Navy take the lead role in the relief work in the cyclone-hit areas as the State Government agencies lag far behind.

SUHRID SHANKAR CHATTOPADHYAY

IT was clear from the nature of the precautionary measures taken by the Orissa Government following the cyclone warnings issued by meteorologists that the administration did not expect anything close to a calamity of the magnitude that was witnessed on October 29 Normally, a deep depression that forms near the Orissa coast in the Bay of Bengal portending a storm, drifts north, towards the direction of Bangladesh However, this time the eye of the storm stayed focussed on Orissa, and the storm hit the State s coast in the form of a super cyclone

According to official reports, by the night of October 28, some 20,000 people were evacuated from Paradeep Kujang, Erasama, Balikuda and Nagaon blocks of Jagatsinghpur district Residents of the villages did not heed the weather forecast as they did not expect anything more than heavy rain and some sharp gusts In fact several villagers had to be evacuated forcibly some of them even "escaped" from the relief centres The district administration had been asked to stock adequate relief materials to deal with the post-cyclone situation Chief Minister Giridhar Gamang had sought the Army's help to undertake relief work

The cyclone struck at 3 a m the following day and within 36 hours, changed completely the face of 10 of the most important districts in the State The worst-hit were the districts of Jagatsinghpur and Kendrapara

The Army the Air Force and the Navy were among the first agencies to swing into action Several aircraft of the Air Force and the Navy and also Indian Airlines were pressed into service The Army s relief and rescue operations called Operation Sahayata, was launched under the supervision of Force Commander Major-General A S Klair The Army started clearing the roads and evacuating marooned people By November 4, 16 000 stranded people were moved to safety and 670 km of road length were

What were land routes until October 29 are now navigated by boats Hungry people scampered on sighting an Air Force chopper, hoping to receive some relief

The picture was no better in the Chandheli region in Bhadrak district access to the survivors was only by boats With their rooftops torn off, the victims lived amidst floating carcasses, exposed to disease While food was air-dropped, drinking water was unavailable

The situation in Balasore, Bhadrak, Jajpur, Kendrapara and Jagatsinghpur districts worsened as a result of flash floods in the Baitarani, the Brahmani, the Subernarekha and several other rivers In Bhadrak district, the Kansa Bansa and Salandi rivers washed away more than 50 villages Bijayshree Routray, who represents Basudevpur in the State Assembly, told *Frontline* 'Thousands of people and over 30,000 head of cattle have been killed"

Balasore district was cut off owing to the breaching of National Highway Number 5 and the railway line However, the missile launching pad at Chandipore on-sea was not affected

More than 2 5 lakh families in Jagatsinghpur district were rendered homeless and 1 5 lakh head of cattle affected With relief not reaching all parts of the district, it is reported that the starving people are eating cattle fodder In Erasma, at least 30 people are reported to have died of starvation In Jajpur district, 15 5 lakh families were affected In Puri, the number of deaths was officially estimated at 151 More than 5,000 tourists were reported to be stranded in the district

In Keonjhar district, 40 villages were marooned More than 10,000 people sought shelter in relief camps Bridges over the Singhei and Kusei rivers in the district collapsed The State highway between Keonjhar and Cuttack was cut off, with the Kusei changing course near Anandpur

Bhubaneswar, considered one of the greenest cities in the country, was a shambles It appeared the city was in the middle of a war zone – trees were uprooted, buildings damaged, lamp posts broken, houses smashed, hoardings torn off, fences broken, cars wrecked and parks destroyed

Seven days after the cyclone hit the State, rail communication had not been restored completely and inundated roads not cleared for traffic Indeed, Orissa appears to have a long haul ahead. ■

Army personnel engaged in rescue work in Balasore district.

Movement of relief vehicles from West Bengal into Orissa was hampered as a large section of National Highway 5 had breached. (Below) Villagers en route to Cuttack cross a damaged highway in Soro near Balasore on November 3.

cleared. With 5,000 Army personnel engaged in relief work, remote regions of the State were made accessible. Army jawans moved into flooded areas in boats and helped in making an assessment of the damage and delivering relief. Up to eight infantry columns, eight engineers' columns and a medical unit were engaged in the operation. Relief camps were opened at Kendrapara and Jagatsinghpur to provide food, shelter and medical attention to the cyclone victims. The Army was the only supplier of drinking water to the affected areas. Although the Air Force air-dropped food packages, it could not drop water. "The containers would break if we dropped them from such heights," said Squadron Leader Joe Emanuelle. The Navy cleared the passages to the berths in the Paradeep Port. That enabled relief teams to enter Paradeep, which bore the brunt of the cyclone.

The Air Force provided immediate relief by dropping food packets in areas that were not accessible to the Army. The Air Force rescue team under the command of Group Captain H.P.S. Natt comprised 15 pilots, 28 airmen and 14 other crew members. It set up base at the Biju Patnaik airport in Bhubaneswar and, with eight choppers, carried relief material from dawn to dusk. "On an average, 71,000 kg of dried cooked food are dropped in the affected areas. But every day we try to increase the quantity," Natt told *Frontline*. He said that the Air Force was assisted by Army personnel and volunteers from the National Cadet Corps (NCC), and the National Service Scheme (NSS). Local non-governmental organisations (NGOs) also extended help.

The police team sent by the Andhra Pradesh Government was largely responsible for clearing the roads in Khurda district and in Bhubaneswar.

SUSHANTO PATRONOBISH

Passengers of a train, stopped in its tracks, rush to pick up relief supplies dropped by an Army helicopter at Pithakalia in Balasore district.

Giridhar Gamang told *Frontline*: "The situation is grim. In most areas communication links could not be restored and that hampered relief work. We have demanded an immediate relief of Rs.500 crores from the Centre. Drinking water and electricity supplies are being restored in phases in Bhubaneswar. But what we need desperately is aid and assistance from the Central Government and other State governments and the fullest cooperation and support of the people. The moment has come for the Centre and other States to provide as much grant as possible for the millions of cyclone victims. I have contacted the Prime Minister, the Defence Minister, (Congress(I) president) Sonia Gandhi and the Chief Ministers of West Bengal, Andhra Pradesh, Rajasthan, Maharashtra and other States, requesting them to help us."

Gamang, however, feels that because prior warnings had been put out and the administration had geared itself up to face the threat, the casualty figures this time would be lower than those of the last major cyclone that hit Orissa in 1971. The toll in 1971 in terms of human lives was between 7,000 and 8,000. Unofficial figures this time estimate the toll in Paradeep alone to be around 5,000.

Revenue Minister Jagannath Patnaik, who is in charge of relief, told *Frontline*: "Gujarat, Madhya Pradesh and Andhra Pradesh have helped us out in a very big way by sending dry food and other assistance. As the drinking water crisis is acute, UNICEF (United Nations Children's Fund) has given us two crore halogen tablets. Water is supplied also by the Army. To contain epidemics, we are providing antibiotics. But we require more of them. More than a hundred teams of doctors, belonging to the State, the Army and the A.P. Government, and other health staff are working in the affected areas." He said that the financial grant provided by the Centre was inadequate. (On November 5, the Centre announced an additional grant of Rs. 100 crores.)

Some of the other government that extended aid to Orissa are: West Bengal (relief material worth Rs.10 crores); Bihar (Rs.10 crores and Rs.1 crore worth of relief materials); Tamil Nadu (Rs.50 lakhs); Madhya Pradesh (Rs.50 lakhs); and Delhi (Rs.30 lakhs).

A CENTRAL team comprising Ministers George Fernandes, Naveen Patnaik, Joel Oram and Devendra Pradhan visited the affected areas. Oram, who is charge of Tribal Affairs, told

SUSHANTO PATRONOBISH

The trail of misery

SUHRID SHANKAR CHATTOPADHYAY

CYCLONES are a part of life in Orissa, but the people of the State's coastal districts were not prepared for a tragedy of the magnitude caused by the "super cyclone" of October 29.

"We have never experienced anything of this kind before. We thought it would be just another cyclone that would blow away our rooftops or damage the walls. But this turned out to be a killer," Naren Bahera, a fisherman whose entire village was washed away, lamented. Naren and his family survived, as he took heed of the warnings put out by the meteorological authorities 48 hours in advance. Along with his wife and two children, Naren took shelter in the hospital of Paradeep Phosphate Ltd (PPL) in Paradeep.

Now, he and his family face starvation. "The *chira* (dry cooked food) airdropped by the Navy helicopters twice, is insufficient for so many of us. There is a scramble for food, and in the last six days I have been able to lay my hands on food only once, that too a small quantity of it. I shared the food with the members of my family. As for drinking water, we hardly have any," he said.

Even if Naren and his family survive this battle against hunger and disease, the future hardly has anything to offer him. He lost all his belongings, including his boat. "I have lost my means of livelihood and I now cannot afford to buy myself a new boat," he said. He has no news of his younger brother, a construction worker in Bhubaneswar. "He should be safe in the city. The only way before Naren is to find some work in the city. "If that does not happen, we will be reduced to begging for food in the streets," he said.

ALONG the National Highway near Cuttack, Mili Jena has pitched a tiny makeshift tent, made of a torn piece of cloth, supported on two sticks. With an infant in her arms, she waves down passing vehicles and begs for food. Her village was destroyed completely. She and some other residents managed to reach areas that were not inundated and finally chose to pitch their tents adjacent to the highway. Since her husband died a year ago, her brothers, who live in the city, were providing for her needs. "Now that my village is gone, they will not be able to send any money, and I will not be able to feed my child," she wept. But she hopes that her brothers will eventually find her.

Laxmi and her aged mother joined a group of people outside the house of Union Minister Naveen Patnaik in Bhubaneswar to voice their grievances. The slum in which she resided had been wiped out. "We have no place to go, no money. We have lost everything. There is no food, no water... We are as badly affected as those marooned people for whom food is being airlifted. We want the Minister to understand our plight too. We have had no food for the past five days. There is no drinking water, and we are dying," she cried.

There is similar, or perhaps worse, agony elsewhere, in areas not reached by the Army rescue teams. The "super cyclone" has indeed been a great leveller. ■

Frontline that he was unhappy with the way the State government handled the crisis. "The State government is not doing its best The party (Congress) is divided, the Cabinet is divided. Even in a time like this there is groupism They did not stock sufficient quantity of foodstuffs," he said

Naveen Patnaik the Union Minister for Mines and Minerals, said: "I am appalled to see that the government is completely paralysed I do not want to make this a political issue When I visited Kendrapara, I saw carcasses all over the place and people starving without food and drinking water for five days. They had no roof over their heads Several people had no decent clothing. It is a terrible situation. If I can reach there by road, I do not see why the State government cannot." He condemned the State government's inability to control the law and order situation. "There is rampant looting on the highways," he said.

Jagannath Patnaik, however, denied that there was a law and order crisis. He said that anti-social elements had initially looted relief trucks and other vehicles. "We stationed patrols on the highways and no such incident has taken place since then," he said

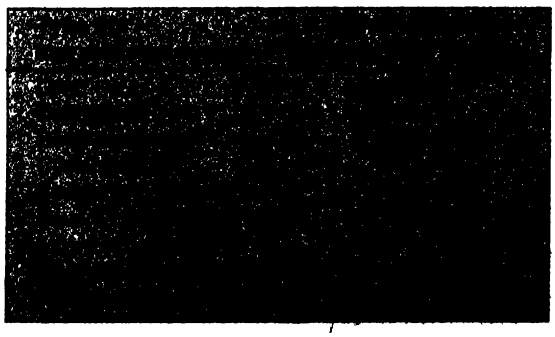
However, informed sources maintained that food riots broke out in the affected areas Many residents facing food shortage looted trucks carrying emergency food supplies

"They are forcibly taking away any edible stuff that they can lay their hands on," an official source said He further said that the government was unable to handle the law and order situation. Two days after the cyclone crossed the coast, Bhubaneswar became a dangerous place by night as desperate victims started breaking into shops. With normalcy returning to the city, the number of such incidents decreased.

Government agencies and the district administration faced severe criticism in the affected areas. "Where are the district authorities and government representatives? They fled like rats to safer places when the cyclone hit. They have not even visited the place since," said an irate victim in Paradeep.

In spite of the claims made by the State government that it was doing its utmost to restore normalcy, the general feeling is that it is not possible to hope for normalcy to return in the near future under an administration that is just not there.

■ DISASTER

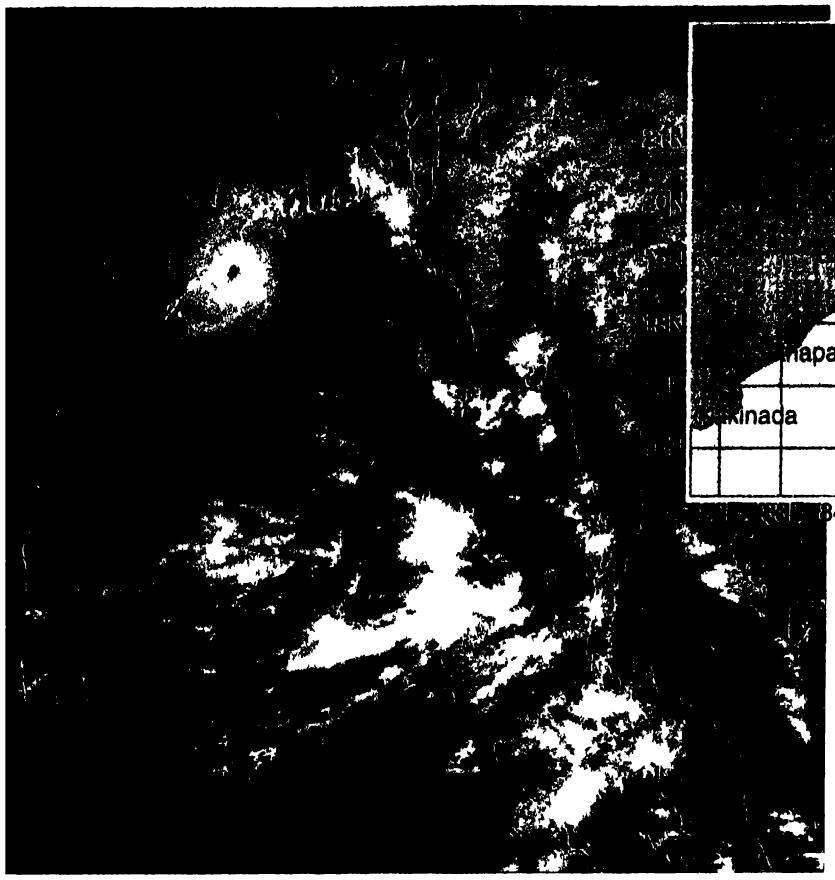


Scientific failures

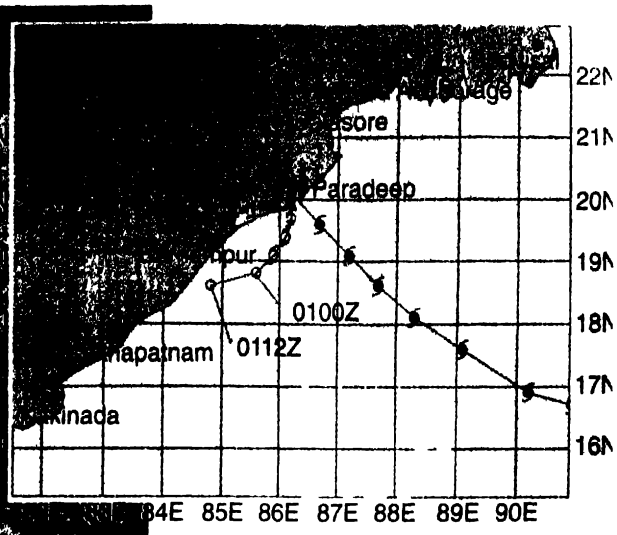
The scientific systems whose responsibility it was to predict the contours of the cyclone did a far from perfect job. To be able to do a better job next time around, an integrated approach to cyclone studies is needed.

R. RAMACHANDRAN

THE cyclone which crossed the Orissa coast at Paradeep caused unprecedented devastation on October 29 owing to a combination of factors, the most important of them being the nature of the cyclone itself. It was a very-high-intensity cyclone (T-7 in what is called the Dvorak Scale of T-1 to T-8 in meteorological parlance) and is very rare in the northern Indian Ocean region. The cyclone that hit Andhra Pradesh in 1977 was the only other recent case which had associated winds of speeds of over 250 kmph and huge storm surges churning sea water to heights of up to 10 metres.



A unique and crucial feature of the cyclone system that hit Orissa was that it remained anchored over land for more than 48 hours and its intensity continued to remain fairly high, with associated winds (of over 100 kmph) in its vortex. Indeed, the well-formed cyclone eye (the central calm region, which in this case was 49 km across) and the eye wall are clearly visible in satellite images received until October 31. This is, in fact, an unusual feature because normally, as they move over land, cyclonic systems weaken and die out in the absence of energy inflow through moisture-laden surface winds. As the cyclone system was anchored near the coast, surface winds continued to feed moisture into it, resulting in heavy rainfall all across the sweep of the cyclonic circulation extending hundreds of kilometres.



The real meteorological cause of the cyclone remaining stationary for long over land, as if a large-scale atmospheric system was blocking its northwestward motion, is not yet known and will become a subject of a major scientific investigation. In fact, the cyclone track looped back sharply from the anchored spot on October 31 (another rare phenomenon) and a considerably weakened cyclone was seen moving in the south-southeastern direction. This behaviour is indicative of an important characteristic of cyclones. Even though, with the advent of satellite imagery, the genesis of a cyclone can be seen and tracked well in advance, the exact behaviour of the cyclone, including its intensity build-up and landfall, is a product of its interaction with the environmental meteorological forcings. This makes predictions of the track, landfall and life of a cyclone quite difficult. In fact, when the system is weak, the prevalent atmospheric factors around the cyclone influence its behaviour and movement. But once the system gets intensified, it becomes more energetic than the surrounding systems and the cyclone begins to influence the environment strongly.

The history and evolution of the cyclone was as follows:

On October 25 afternoon a "depression" had formed, centred about 550 km east of Port Blair in the Andamans. It moved northwestwards and concentrated into a "deep depression" by midnight. It intensified into a "cyclonic storm" on October 26 morning when it was about 350 km from Port Blair. At this point, the India Meteorological Department (IMD) warned of a potential threat to the north Andhra-

INSAT-1D image of the "super cyclonic storm" (T-7) as it crosses the Orissa coast at Paradeep on October 29.

The track of the cyclone, from October 27, when it intensified into a "severe cyclonic storm" (T-3.5), until November 1, when it weakened into a "deep depression" and finally a "depression" and moved southwards along the Andhra Pradesh coast. The loop back of the cyclone occurred on October 31 near Cuttack. This is based on Meteosat imagery.

Orissa-West Bengal coast arising from a "severe cyclonic storm" The system moved northwestward and intensified into a severe cyclonic storm on October 27 morning when it was about 750 km from Paradeep Predicting that it was likely to intensify further, the IMD issued a "cyclone alert" to Cyclone Warning Centres at Visakhapatnam, Bhubaneswar and Calcutta Although the IMD predicted heavy winds and rainfall for October 28 itself, the cyclone remained fixed for six hours at about 600 km from Paradeep and intensified into a "very severe cyclonic storm" (Table on Page 28 gives the IMD's classification of low-pressure systems)

On October 28, the cyclone continued its northwestward movement and intensified into a "super cyclonic storm" – a new term, hitherto not used in meteorological parlance – as the wind speed increased to over 260 kmph as it approached the Orissa coast The IMD had predicted landfall between Puri and Balasore in the early hours of October 29 Although the cyclone hung over the sea near the coast a little longer than expected, it crossed Paradeep on October 29 between 10 a.m. and 12 noon. After crossing the coast the system hardly moved and it weakened gradually over the next two days Somewhat unexpectedly, it curved back and finally moved south wards over the sea along the Andhra Pradesh coast As the system remained stationary, the IMD predicted both on October 30 and 31 its movement in the northeastern direction over land, which did not occur

ALL this might suggest – as indeed the IMD has been claiming – that the forecast of the track and the final landfall location, and the corresponding warnings issued by the IMD, were accurate and that it was only the government's disaster management machinery that failed the people of Orissa While in the main this seems to be true, the scientific machinery and the predictions were far from perfect and these need to be highlighted Whether or not these did contribute to the improper communication to the officials in Orissa, and the consequent ill-preparedness to mitigate the disaster, is not clear though news reports from Orissa suggested that even meteorological officials in Bhubaneswar did not have proper information.

For instance television reports on the night of October 28 and early morning on October 29 quoting an IMD official in Bhubaneswar said The latest reports say that the cyclone centred just 180 km south east of Paradeep has changed its path slightly and is heading for the West Bengal coast The cyclone is likely to strike between Puri in north Orissa and Sagar in West Bengal ' This apparently caused a great deal of confusion in the minds of the people of Orissa and also led to some complacency in the contingency planning, at least in and around Bhubaneswar Indeed, this report also led to a rapid large-scale evacuation from areas around Sagar in West Bengal The IMD headquarters, however, denies that such a warning or announcement was ever issued But it is on record that the Bhubaneswar meteorological office did state this to the press, apparently based on a communication from Delhi

Inexplicably in this age of information super highways, while all the major meteorological centres of the world were putting out real-time information on the Orissa cyclone, including downloadable satellite images from the National Oceanic and Atmospheric Association (NOAA) and Meteosat satellites, there was nothing on the IMD Web page (www weather delhi nic in or www imd ernet in) about the calamitous

A project-in-waiting

SUDHA MAHALINGAM

IT was the breakdown of communication networks that turned the cyclone disaster in Orissa into a catastrophe. Flood waters washed away not only access roads but all terrestrial communication channels that linked the districts to the outside world. This hampered relief and rescue work. This would not have happened had the POLNET project, conceived 10 years ago, taken off and been commissioned as scheduled in 1998.

POLNET, developed by scientists at the Indian Space Research Organisation, was designed to provide a unified police satellite communications network to integrate the entire country for quick exchange of data. Although the project was to facilitate exchange of information on the movement of criminals, crime fact-sheets and access to Interpol's crime profiles of foreign terrorist organisations and individuals, the network would have provided the much-needed connectivity during the cyclone.

Conceived originally by Prime Minister Rajiv Gandhi, the project was cleared by the Central government in 1996. Funds were also earmarked. It was to be partly funded by the Union Home Ministry, the Central paramilitary forces and State governments. The Tenth Finance Commission even earmarked funds for 21 States included in the project. However, the project is stuck in the Home Ministry. At a meeting held in September this year, Union Home Secretary K.K. Pandey is learnt to have raised doubts about the need to implement the project despite the fact that the absence of a POLNET-type network was felt during the Andhra Pradesh cyclone disaster of 1996.

The analogue technology used in communications systems at present is primitive, and remote areas in the country do not have communication links even with district headquarters. POLNET was to connect every police station in the country and replace the present network run by the Directorate of Police Coordination Wireless (DPCW). It was also meant to connect every police station in the country with the Interpol headquarters at Lyons, France, through the transponders of the INSAT-2B and 2C satellites. It was designed to connect 600-odd districts in India through 823 hubs, and transmit data at a speed thousand times faster than the present radio communications systems used by the police. It was to be a very efficient alternative to the telephone and other networks. Currently communication among various districts is through a telegraphic data processor. It might take four days even for an urgent message to reach its destination. Besides, DCPW messages often suffer distortion during transmission and are vulnerable to eavesdropping. POLNET, on the other hand, was to have a locking system which would have prevented such lapses.

The delays have pushed up the cost of the project. The total cost worked out by the C.P. Joshi Committee in 1988 was Rs.182.78 crores, but in 1998 it had already gone up to Rs. 288 crores. This is not to mention the cost of precious lives lost owing to the lack of communications and the consequent hampering of effective disaster-management. ■

event, not even INSAT images which the IMD receives every half hour. Indeed, there is a link indicated for the cyclone and a click on that only takes you to a United States Navy site. Web sites such as this (www.npmos.navy.mil) or of the NOAA (www.osei.noaa.gov) or of the European Centre for Medium Range Weather Forecasting (ECMWF) showed the track of the cyclone in almost real time; the ECMWF and the U.S. Navy even predicted the track and landfall of cyclone fairly accurately. Incidentally, Pakistan's meteorological department, which does not have a satellite, runs a fairly good Web site using images, analyses and predictions of other centres.

Given this and the apparent confusion in some wings of the IMD about the landfall even less than 24 hours in advance, the question arises as to how accurately the track of a cyclone can be predicted and how far ahead. Given the complexity of cyclone dynamics and a cyclone's highly non-linear interaction with the environment (within a matter of 24 hours a cyclonic system can grow into a very severe cyclonic storm), even state-of-the-art techniques of investigating severe cyclones with powerful computers cannot predict their motion very accurately. But less than 24 hours before landfall, the error in prediction comes down to 50 km, about the size of the cyclone eye itself. So what could have been the reason for the reported announcement of a change in course of the cyclone on October 28?

The circulation in a cyclone usually extends to about 1,000 km horizontally and to about 15 km vertically. Therefore, while the cyclone movement is influenced by the upper atmosphere winds, the feeding of energy and moisture to sustain the cyclone is done by sea surface winds. The initial path is dictated by the dominant currents in the upper atmosphere, known as steering currents, and the presence of easterlies from the Pacific during these months causes the northwestward movement of cyclones over the Bay of Bengal until they become energetic and begin to influence the environment severely.

The methods operationally available to the meteorologist for forecasting the movement are. a) "climate persistence" technique, that is, assuming a continuation of the track already established from previous observations; b) "climatology", that is, normal tracks followed by cyclones in corresponding seasons or previous years; and c) numerical models, using environmental data, including wind speeds and cloud motion vectors of the upper atmosphere from satellite data. In this particular case, as can be seen from the final track, the cyclone followed a path that was just an extrapolation of the evolving track over land. In that sense, from the perspective of prediction, it was a simple and "well-behaved" cyclone.

But if a climatological judgment based on the statistics of past data as well as other meteorological parameters like new strong wind or pressure systems over land had been employed, it could have led to an empirical conclusion that the cyclone was likely to move towards West Bengal. For it is reliably learnt that there were two anticyclones over land, when the cyclone was about to cross the Orissa coast, that would, in general, tend to oppose the cyclone's northwestern motion and weaken it.

As regards numerical models, the National Centre for Medium Range Weather Forecasting (NCMRWF) makes

use of the grid model called T-80 (which has a coarse resolution of 150 km as compared to models used by the ECMWF and other centres) and meteorological parameters derived from satellite data. Data on wind vectors, cloud motion vectors, temperature and so on derived from satellite images are important inputs to any numerical model analysis of a cyclone, which is necessary if one has to include all the interactions of the cyclone with the environment in the model calculations.

Sufficient manpower and resources must be directed towards an integrated approach to cyclone studies on a mission mode that would work towards a large-scale model which can be used for operational forecasts.

Interestingly, the upper atmosphere winds as derived by the IMD from INSAT data showed north-easterlies over West Bengal as it normally would have been if the north-east monsoon had become active. If this was indeed the case, then it would have weakened the cyclone system since this would be opposing the cyclonic vortex winds. And indeed, the NCMRWF's analysis had indicated a dissipating cyclone even before it hit the coast. Wind vectors derived from other satellites such as Meteosat of NOAA showed dominant south-easterlies, rather than north-easterlies, which would tend to steer the cyclone in the north-western direction. However, the NCMRWF did not use Meteosat data because apparently Meteosat raw digital data are not received by the IMD.

SO, why did INSAT data show north-easterlies in the upper atmosphere which Meteosat did not? According to NCMRWF scientists, this is perhaps because INSAT-2E, which was launched in April this year, has not been providing any meteorological data for more than two months. (The satellite image accompanying this article has been sourced from INSAT-1D). This hitherto undisclosed information was confirmed by reliable sources in the Indian Space Research Organisation (ISRO). Apparently, the entire Very High Resolution Radiometer (VHRR) has become non-functional because of the failure of the servo motor mechanism in the "scan mirror" assembly. As a result, no data in the visible, IR or water vapour channel region are available from the VHRR, the key instrument of the meteorological payload of INSAT-2E.

Since Dr. K. Kasturirangan, ISRO Chairman, and Dr. S. Rangarajan, Director of the Master Control Facility (MCF), Hassan, are out of the country, no official comments were available. Dr.S.N. Srivastava, IMD Deputy Director-General, and Dr.H.V. Gupta, Director, Satellite Meteorology, declined to confirm or deny the failure of the instrument. Both used the euphemistic phrase that INSAT-2E meteorological payload is still in the "test mode" and is not yet operational. This would be strange for a satellite launched in April 1999.

However, according to ISRO sources, the CCD (charge-coupled device) camera is working perfectly and images from it are available to the IMD. In fact, CCD images are of a better resolution (of 1 km) as compared to the VHRR's 2 km and are particularly suited for tropical cyclone analysis. Unfortunately, some seven months after the satellite launch, the software for analysing CCD images and deriving wind vector data is still not in place at the IMD. So the data used for deriving meteorological parameters are from INSAT-1D, which is nine years old and well beyond its normal life-time. It is on an inclined orbit and any wind vectors derived from it could lead to errors. In fact, if INSAT-2E data were available, it would have included moisture data around the cyclone as well, which would have been extremely useful in forecasting the intensity of the cyclone because it is the moisture-carrying low-level currents that feed energy to and sustain cyclones.

As part of the cyclone warning system along the coast, the IMD has a network of cyclone detection radars (CDRs), which have a range of 400 km (essentially determined by the curvature of the earth). These high-power radars are basically capable of detecting the cyclone eye, the eye wall cloud and the spiral bands of clouds at a distance which an average cyclone would cover in a day. This network also includes an experimental Japanese radar at Visakhapatnam, which can also measure precipitation in the cyclone. Doppler radars (DRs), on the other hand, could provide details of the cyclone's wind field in addition to the usual data from CDRs. Their ability to monitor continuously the wind maxima associated with the wall cloud and the radial extent of the hurricane strength wind field can be of great value to the forecaster.

But, unfortunately, even though the decision to set up three DRs was taken nearly seven years ago, and money sanctioned immediately thereafter, not even one has been set up. One is being built by ISRO in association with Bharat Electronics Limied (BEL) and is undergoing tests The other two were to be imported in order to save time, but a German supplier was identified only recently. Meanwhile, the indigenous effort seems to have already come good. Once tested, BEL should be entrusted with producing these in greater numbers to be installed all along the coast, say experts.

All these may not have had any direct bearing on the warnings issued by the IMD. It was perhaps one of those chance events that the cyclone track was a simple one. That in spite of this the administrative machinery simply collapsed in the face of it is another matter. But future ones could be those more complex recurving ones, which would defy such simple extrapolations. The important question of why the cyclone remained anchored over land and then recurved could throw light on new and unexpected dynamic forcings on cyclone. It is possible that the two anticyclones observed over land shortly before the cyclone struck were responsible for this, and the cyclone being very intense just stayed put and could not be diverted.

From the point of view of an operational prediction of cyclone intensity and movement, the lessons of the Orissa cyclone for the scientific community are clear. Sufficient manpower and resources must be directed towards an integrated approach to cyclone studies on a mission mode that would work towards a large-scale model which can be used for operational forecasts. Today, even though the NCMRWF, with its CRAY Supercomputer, is situated on the same campus as the IMD, there is no regular interaction between the two organisations.

The NCMRWF does not get the IMD wind vector data directly from the IMD; it has to wait for them to be put on the World Meteorological Organisation's global data network. ■

KAMAL NARANG

BJP leaders Atal Behari Vajpayee, L.K. Advani and Kushabhau Thakre at the National Executive meeting in New Delhi; (facing page) party delegates at the meeting.

POLITICS

The BJP's dilemma

In a post-election self-congratulatory mode, the BJP's National Executive seeks to gloss over pointers to the party's political fault lines.

V.VENKATESAN
in New Delhi

THE Bharatiya Janata Party, which heads the multi-party ruling coalition at the Centre, has always claimed that collective leadership and decision-making is its hallmark. The party's apex decision-making body, the National Executive (N.E.), meets at least once in three months to discuss and decide on major tasks. However, the 147-member Executive has over the years become just a debating forum, with key decisions concerning the party and the governments it runs being taken elsewhere – by a group of senior leaders. Yet, the N.E. serves as an instrument that facilitates periodical interaction among the party's leaders across the country and provides feedback from the States to the central leadership on the BJP's and BJP-led governments' functioning, among other things.

With the BJP finding itself in government for the second successive year after the 1999 Lok Sabha elections, relations between the party and the government have acquired a new dimension. The party, which had for long been in an opposition mode, is now under compulsion to back the government and target its political adversaries. The Vajpayee government enjoys a comfortable majority in the Lok Sabha, though it is mostly owing to the numerical strength of the BJP's innumerable allies in power. The BJP is anxious to preserve its dominant status in the coalition.

The N.E. meeting in New Delhi on November 3 and 4, called to discuss the results of the Lok Sabha elections, began on a self-congratulatory note. Party president Kushabhau Thakre, in his speech, stressed that the party had grown between 1996 and 1999. "What has emerged in this election is a bipolar polity. The dominant pole is the BJP; the other pole is the Congress(I)", he said. He accused the Left parties of being the "palanquin-bearers" of the Congress(I) and claimed that they had eventually been reduced to "a mere footnote in history". "We have to expand our base further and reach out to more sections of the people. This has to be our relentless effort," he said.

The N.E. took note of the fact that the BJP now had Members of Parliament from 18 States and one Union Territory (Andaman and Nicobar Islands). The party has representation from the Andamans to Jammu and Kashmir, and from Kamrup to Kutch, its spokesperson M. Venkaiah Naidu said. It won 25 seats reserved for the Scheduled Castes and 21 seats reserved for the Scheduled Tribes in the recent elections. It has 15 women MPs.

The N.E. members felt that the party's base had expanded geographically and socially and its political appeal had widened. The recent elections also ensured representation for the party for the first time in the West Bengal Assembly.

As for the multi-party alliance it struck, the BJP found that the regional alliances were useful to expand its base in some States. In Andhra Pradesh, the party, with the help of the Telugu Desam Party (TDP), won seven of the eight Lok Sabha seats and 50 per cent of the Assembly seats it contested. "The alliance was beneficial to both the TDP and the BJP," Venkaiah Naidu said.

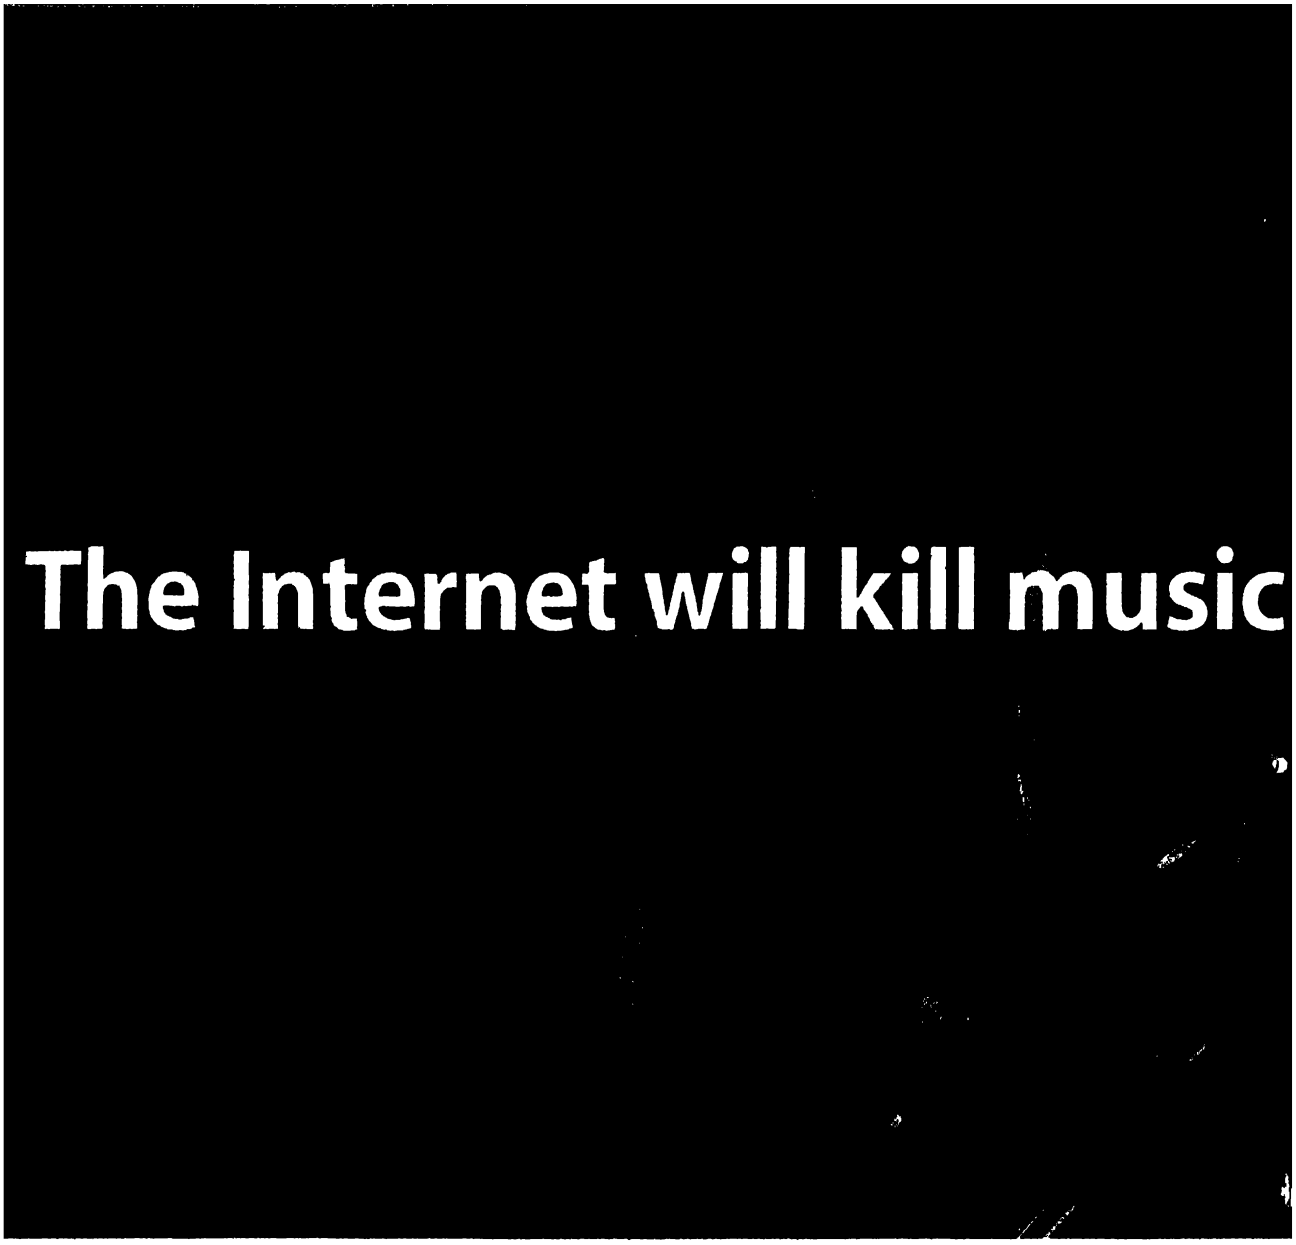
However, in Karnataka and Bihar, its alliance with the Janata Dal (U) proved a liability. Party members from these States blamed the tie-up with the Janata Dal(U)

for its setbacks. The leadership was all sympathy for the Karnataka leaders, who had from the beginning opposed the entry of the Janata Dal(U) into the National Democratic Alliance (NDA). They felt that the BJP was badly affected by the anti-incumbency mood in the State, which was under Janata Dal rule when the elections were held. (Janata Dal Chief Minister J.H. Patel and his supporters fought the elections as part of the NDA.)

The results of the Lok Sabha elections held in four constituencies (Bhagalpur, Purnea, Rajmahal, and Khagaria) in Bihar in the fourth phase, and one in Assam (Dhubri) on October 28 disappointed the BJP. In Bihar the party lost by huge margins three seats it had won in 1998, while its ally, the Janata Dal (U), managed to retain the Khagaria seat. Venkaiah Naidu reasoned that people who voted in the fourth phase were aware that the Vajpayee government was comfortably placed at the Centre and therefore they did not feel the need to vote for the BJP.

Members from Bihar argued that the results of the fourth phase showed that the Janata Dal(U) did not campaign for candidates. The senior leaders of that party, most of them Ministers in the Vajpayee government, were busy with the Parliament session, a BJP vice-president pointed out. Venkiah Naidu admitted that there was lack of coordination between the alliance partners. Caste equations and sympathy for certain candidates also contributed to the debacle, the BJP spokesman claimed. The N.E. attributed the results in the fourth phase to "local factors" as national issues did not dominate the campaign, he said. Although the BJP had won on its own strength these seats in 1998, it was at pains to emphasise that the results could have been different had Janata Dal(U) leaders campaigned.

The N.E. also discussed Uttar Pradesh amidst reports that Chief Minister Kalyan Singh may be replaced (see following story). Members, including Union Home Minister L.K. Advani, said that organisational problems, the anti-incumbency feeling among the electorate, and tactical voting by the minority community contributed to the party's debacle there. Had the party retained its strength in U.P., it could have got more than 200 seats in the Lok Sabha, members felt.



Kalyan Singh found himself isolated at the meeting as Advani insisted on taking certain "corrective steps" to improve the party's prospects in the Assembly elections, which are due in one year. Although he did not identify these steps, his supporters hinted that Kalyan Singh's removal had almost been decided, although the leaders were divided on its timing. Party vice-president Jana Krishnamurthy appealed to the U.P. leaders to find a solution to the organisational crisis in the State, or abide by whatever the central leadership decided. The central leaders' dilemma is obvious: they fear that a hasty removal of Kalyan Singh could harm the party in the long run by alienating it from the backward class people.

For the moment, however, the leadership wants to tell the cadres that the U.P. setback should not dampen their spirits. "*Suraj* (good governance) is our goal," said Venkaiah Naidu. He added: "This government will last. The uncertainty over the stability of the government is over." He said that the real test for the party organisation was the conduct of its MLAs, MPs, and Ministers. "Their behaviour should be different from what was witnessed during past regimes," Venkaiah Naidu said, summing up the deliberations.

The political resolution, passed at the N.E. , makes no reference to the Bofors issue but urges the government to pass the Lok Pal Bill so as to launch a frontal war against corruption in public life. Seen in the context of Advani's promise to the Congress(I), made in the Lok Sabha, that the government would consider its request to delete Rajiv Gandhi's name from the Bofors charge-sheet, the absence of any reference to the Bofors issue in the N.E. is intriguing.

The BJP, to quote Advani, has overcome its "untouchability" by adding to its allies since 1996, when its government collapsed within 13 days of its formation. The contradictions within the NDA since it came to power show that the BJP's achievement in winning friends may not be all that real.

The party is gearing to face its National Council session, to be held in Chennai towards the end of December. With Kushabhau Thakre declining a second term, the search for the next president is likely to begin next year. ■

In a dither over U.P.

The Uttar Pradesh imbroglio continues as the Bharatiya Janata Party leadership is deeply divided on the question of replacing Kalyan Singh as Chief Minister.

VENKITESH RAMAKRISHNAN

CONFUSION reigns supreme in the Bharatiya Janata Party when it comes to handling its affairs in Uttar Pradesh. The political game that started in the party immediately after its stunning reverses in the State in the Lok Sabha elections continues. In an exercise to evolve a new strategy for the party in the State, a series of formal and informal discussions have taken place among leaders such as Prime Minister Atal Behari Vajpayee, Home Minister L.K. Advani, party president Kushabhau Thakre, Chief Minister Kalyan Singh and State party president Rajnath Singh. The National Executive of the party, which met in New Delhi on November 3 and 4, devoted a considerable amount time to discuss the issue. No plan of action, however, emerged.

The differences among the leaders over replacing Kalyan Singh have stalled a solution to the crisis. While Vajpayee and Human Resource Development Minister Murli Manohar Joshi are firmly of the view that Kalyan Singh, who belongs to the Other Backward Classes group, must be replaced as Chief Minister with a representative of the forward castes, Advani and his supporters such as party general secretary K.N. Govindacharya want Kalyan Singh to continue in the post. Kushabhau Thakre is vacillating, though with a pronounced tilt to the opinion of the Advani group.

The Vajpayee group accuses the Chief Minister of having sabotaged the BJP's chances in the Lok Sabha elections by forging a secret alliance with another backward caste leader, Samajwadi Party (S.P.) chief Mulayam Singh Yadav. Kalyan Singh, however, argues that the Other Backward Classes, such as the Kurmi and Lodh Rajput caste groups, are the mainstay of the BJP's support base in the State and that large sections of people belonging to these castes owe their political alliance to Kalyan Singh. Removing him from the Chief Minister's post at this juncture would alienate these sections from the party, according to Govindacharya.

V SUDERSHAN

Chief Minister Kalyan Singh.

The other group does not agree with this perception. The pro-changers, who include State Urban Development Minister Lalji Tandon, argue that the party had planned to replace Kalyan Singh as Chief Minister even before the Lok Sabha elections and there was no reason now to go back on the proposal. "If anything," says a leader close to Lalji Tandon, "the reverses in the elections have strengthened the case for removing the Chief Minister."

The Vajpayee-backed group has made a number of proposals with the express intent of allowing Kalyan Singh an honourable exit. These include the shifting of Rajnath Singh to some position at the Centre and Lalji Tandon to some State as Governor, along with the replacement of Kalyan Singh. The plan is to replace Kalyan Singh with Public Works Minister Kalraj Mishra and give Kalyan Singh a Cabinet berth at the Centre. Another sop held out before Kalyan Singh is the elevation of one of his close associates and a backward caste leader, Om Prakash Singh, as Deputy Chief Minister.

Kalyan Singh has rejected all these proposals. By all indications, he is not ready to negotiate any proposal that involves moving him out of the top position in the State. His supporters aver that the balance of power is clearly in his favour. According to them, Kalyan Singh's strength comes from three factors. First, the strong backing he has in the BJP Legislature Party as well as among the MLAs of alliance partners such as the Uttar Pradesh Loktantrik Congress (UPLC) and the Janatantrik Bahujan Samaj Party (JBSP). The Chief Minister reportedly has the support of over 65 MLAs of the BJP and 28 MLAs of the alliance partners. No other leader has a similar level of support in the ruling alliance. Kalyan Singh acquired this support through a deft political move in the last week of October, by which he virtually split the UPLC down the middle and sidelined Naresh Agarwal, its president, who was moving closer to the anti-Kalyan Singh group of the BJP.

The Tripathi group of the UPLC has threatened that it will pull down the government if Kalyan Singh is removed. With about 11 MLAs, the Tripathi group is capable of carrying out this threat as the Ministry has only a majority of eight in a House of 424 members. Apart from this UPLC group, 17 members belonging to the JBSP and its breakaway faction, the Kisan Mazdoor Bahujan Party (KMBP), too have announced their support to Kalyan Singh.

The second factor in Kalyan Singh's favour is obviously the support of the Advani group at the Centre. Before the Lok Sabha polls, this group too had moved away from Kalyan Singh, perceiving him as a liability for the party. However, after the polls it was quick to realise that Kalyan Singh alone could stop the drain of backward caste votes from the BJP.

Thirdly, Kalyan Singh seems to be

benefiting from the impending elections to the Bihar Assembly. Even those central leaders who advocate his removal are wary as to what would be the impact of such an action on the Bihar polls, especially the because the backward castes account for a large number of votes in that State. Many of these leaders hold the view that replacing Kalyan Singh with an upper-caste Chief Minister would send a negative message to the backward castes in Bihar.

The Chief Minister, meanwhile, continues with his brazen use of power against his detractors. In a follow-up to his October 17 press statement that rumours about a proposed course of action in Uttar Pradesh by the central leadership were not good for the party, he initiated a mass transfer of officers between October 24 and 31. As many as 103 Indian Administrative Services (IAS) and Indian Police Service (IPS) officers were transferred on October 24, and two days later 53 officers were transferred. A statement from BJP general secretary M. Venkaiah Naidu that no change of leadership in the State was being contemplated boosted Kalyan Singh's morale; he even organised a dinner, as if to celebrate the statement. Clearly, Kalyan Singh is in no mood to give up.

The Chief Minister's detractors, however, have one advantage – Vajpayee's insistence that Kalyan Singh be removed. Apparently Vajpayee favours Kalraj Mishra as the replacement for Kalyan Singh and has told his protege in the State, Lalji Tandon, to accept Mishra as a "good compromise candidate". Mishra reportedly enjoys the support of approximately 100 MLAs of the coalition.

There are also other names in circulation. Prominent among them are those of the national secretary of the party, Sangha Priya Gautam, Union Minister Santhosh Gangwar and Assembly Speaker Kesri Nath Tripathi. The first two are projected with the reasoning that they would satisfy the backward caste-Dalit section: Gautam belongs to the Dalit community and Gangwar to a backward caste. Tripathi's name is projected on the grounds that he is more experienced than Mishra and has greater popular appeal.

As these games continue, governance has been suffering. There are growing complaints that all work has come to a standstill in the Ministries. Obviously, the process of polarisation in the BJP has to reach a clear and concrete stage if things are to change in the State. Indications are that the process will reach a critical stage by the second week of November. ■

Revolt in the RJD

Rashtriya Janata Dal president Laloo Prasad Yadav and his wife and Bihar Chief Minister Rabri Devi face a rebellion in the party in the wake of the RJD's debacle in the Lok Sabha elections.

KALYAN CHAUDHURI
in Patna

RASHTRIYA JANATA DAL president Laloo Prasad Yadav is in trouble on his home turf. In the wake of the party's debacle in the Lok Sabha elections, the RJD leadership faces a revolt from within its ranks in Bihar. Some senior party leaders and legislators have demanded Laloo Prasad's resignation and the removal of Rabri Devi, his wife, as Chief Minister.

Firing the first salvo immediately after the results were announced, State Revenue Minister Ramai Ram blamed the party's poor showing on the induction of Samata Party deserters into the party at Laloo Prasad's behest. Subsequently a large number of RJD workers echoed similar sentiments. Senior legislator Maheshwar Prasad Yadav held Laloo Prasad responsible for the electoral debacle and demanded that he and Rabri Devi relinquish their posts to pave the way for persons with a clean image to take charge. "In order to give the party a new lease of life," he suggested that honest leaders, such as Deo Narayan Yadav, Jabir Hussain and Raghubans Yadav, be made party president or Chief Minister. Accusing Laloo Prasad of promoting nepotism, the rebel MLA said: "The RJD has a mass base and cannot be run on the whims and fancies of one person." He said that the RJD chief acted like a dictator and patronised corrupt elements. Instead of removing the scam-tainted MLA, R.K. Rana, from the party, Laloo Prasad fielded Rana's wife from Khagaria.

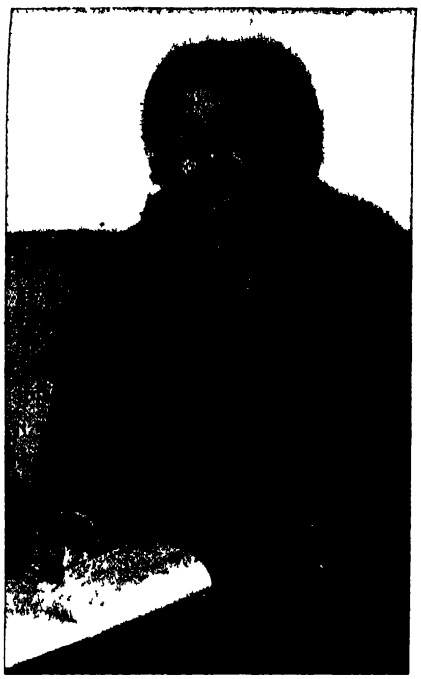
ANU PUSHKARNA

RJD president Laloo Prasad Yadav. Even as he is fighting with his back to the wall, he has declared his intent to battle the BJP and its allies.

Maheswar Prasad said: "The RJD president who lost to Sharad Yadav in Madhepura and Chief Minister Rabri Devi, who could not muster any support for party nominees, have no moral right to continue in office." He told *Frontline* that he would not leave the party but would continue to raise his voice, with the help of like-minded party leaders and legislators, against the misdeeds of the duo.

Claiming the support of nearly two-thirds of party MLAs, he said that the party would break if the Chief Minister was not replaced. He claimed that several MLAs and Ministers shared his opinion and were in touch with him. He added: "We lost the elections only because of Laloo Prasad and Rabri Devi and their coterie. It is time Laloo Prasad's despotic and dynastic rule was ended. He made an unfit Rabri Devi Chief Minister only because he wanted to retain power."

Laloo Prasad's high-profile brother-in-law Sadhu Yadav, a Member of the Legislative Council (MLC), has also joined the revolt. He described the Cabinet as one of "brokers and sycophants" who led the party to a crushing defeat. There is perhaps an element of personal indignation in his outburst as he has been repeatedly denied the ticket for Lok Sabha and Assembly elections. But the issues that he raised worry large sections of the RJD as Assembly elections are due next March. Blaming even his sister Rabri Devi for the rot, Sadhu Yadav demanded that Ministers Mohammed Ilyas Hussain (Road Construction), Jaiprakash Narayan Yadav (Education), Rabindra Charan



Yadav (Energy), Mahavir Prasad (Health) and Munshi Lal Rai (Public Health) be sacked. "There are no roads, no water, no power, no schools and no health facilities in Bihar," Sadhu Yadav said.

As the RJD lost 40 of the 54 Lok Sabha seats (its candidates trailed their rival in 230 of the 325 Assembly segments), the perception within the party is that this is the beginning of the end. The RJD lost even the Khagaria Lok Sabha seat, the election to which was deferred because of floods and held on October 28 along with Rajmahal, Bhagalpur and Purnea. Renu Kumari of the Janata Dal(U) defeated Nayana Rana of the RJD in Khagaria by more than 30,000 votes. (The Congress(I), the CPI(M) and an Independent got a seat each.) Laloo Prasad's detractors view this defeat as a foretaste of things to come.

With Laloo Prasad's core constituency of Yadavs and Muslims beginning to abandon him and his conviction in the disproportionate assets case seen as a possibility, his fate appears to be sealed. In south Bihar, the electorate has rejected him in successive elections, and in the north, which was his stronghold, his support is eroding fast.

HOWEVER, Laloo Prasad, who was down and out in the immediate aftermath of the poll debacle, was quick to recover. He told *Frontline* that the results of the October 28 round of elections revealed the people's indignation against the fortnight-old "communal" dispensation at the Centre. Rejecting the argument that infighting in the RJD was a major issue, he said that he would not prevent any RJD member from crossing over to the BJP or the JD(U). He described the party's setback as temporary and said that the RJD would stick to its declared intent of fighting the communal BJP and its allies. The RJD, he said, was preparing constituency-wise reports on the elections in order to take corrective measures for the Assembly round.

Laloo Prasad is apparently worried about the fodder scam case, which is likely to come up for hearing this month in the Special Court in Patna following the filing of the charge-sheet by the Central Bureau of Investigation (CBI). The charge-sheet against Laloo Prasad in the Rs.950-crore case might once again land him in jail. Meanwhile, according to informed sources, the CBI is going to charge Rabri Devi with "aiding" Laloo Prasad in amassing wealth disproportionate to his known sources of income. The sources said that Investigators had "sufficient evidence" to charge the Chief Minister under Section 109 of the Indian Penal Code for "aiding and abetting a criminal offence". Rabri Devi has failed to prove that she owns the dairy farm mentioned in Laloo Prasad's income-tax returns as the source of his income. The Chief Minister is a co-accused in the case in which her husband is the main accused.

RAJEEV BHATT

Chief Minister Rabri Devi. The filing of a charge-sheet against her by the CBI is likely to strengthen the demand for her removal.

The CBI, the Income Tax Department and the Enforcement Directorate (E.D.) have reportedly so far been able to unearth, on documentary evidence, property worth about Rs.45 lakhs, said to belong to Laloo Prasad Yadav alone. And he has not been able to explain to the investigating agencies' satisfaction how he amassed this wealth, which includes movable and immovable properties.

So far the CBI has charge-sheeted Laloo Prasad in two fodder scam cases (RC-20A/1996 and RC-64A/1996). He was arrested following a court order and then granted bail. The CBI has also sought the Governor's sanction to charge-sheet Laloo Prasad in yet another fodder scam case (RC-38A/1996) along with former Bihar Chief Minister Jagannath Mishra and several others including Dr. S.B. Rana, the alleged kingpin of the scam. However, the CBI is yet to obtain the Governor's sanction for prosecution in the RC-38A/1996 case though it approached the Governor more than a month ago. Most of the cases, involving conspiracy, forgery, cheating and other charges, have withstood judicial scrutiny whenever they were challenged in the lower courts, the Patna High Court and the Supreme Court. For instance, Laloo Prasad and the other accused went to the Supreme Court several times in order to get the fodder scam case quashed. But their petitions were rejected. The final report of the disproportionate assets case (5A/1998) has been pending disposal at the CBI headquarters for two months and is likely to be cleared soon.

The charge-sheet against Rabri Devi is likely to strengthen the demand for her removal. Laloo Prasad's detractors within the RJD are waiting for that moment. The Opposition is coaxing RJD legislators and Ministers, who are willing to cross over to the JD(U), to start a full-scale rebellion against Laloo Prasad. Senior JD(U) leader and Union Minister Ram Vilas Paswan said that the Opposition would not try to pull down the RJD Government as it would fall on its own.

Laloo Prasad is fighting with his back to the wall. The induction of 11 Ministers from Bihar (five of Cabinet rank and six Ministers of State) in the National Democratic Alliance Government clearly is an indication of the "attack" that the BJP-JD(U) combine has planned against the RJD in the Assembly elections.

Laloo Prasad received another jolt when Samajwadi Party (S.P.) chief Mulayam Singh Yadav snapped his ties with the RJD. Mulayam Singh said that it was because of the RJD's alliance with the Congress(I) that it faced a debacle in the Lok Sabha polls. He said that the S.P. would field its own candidates in many seats in the Assembly elections in Bihar.

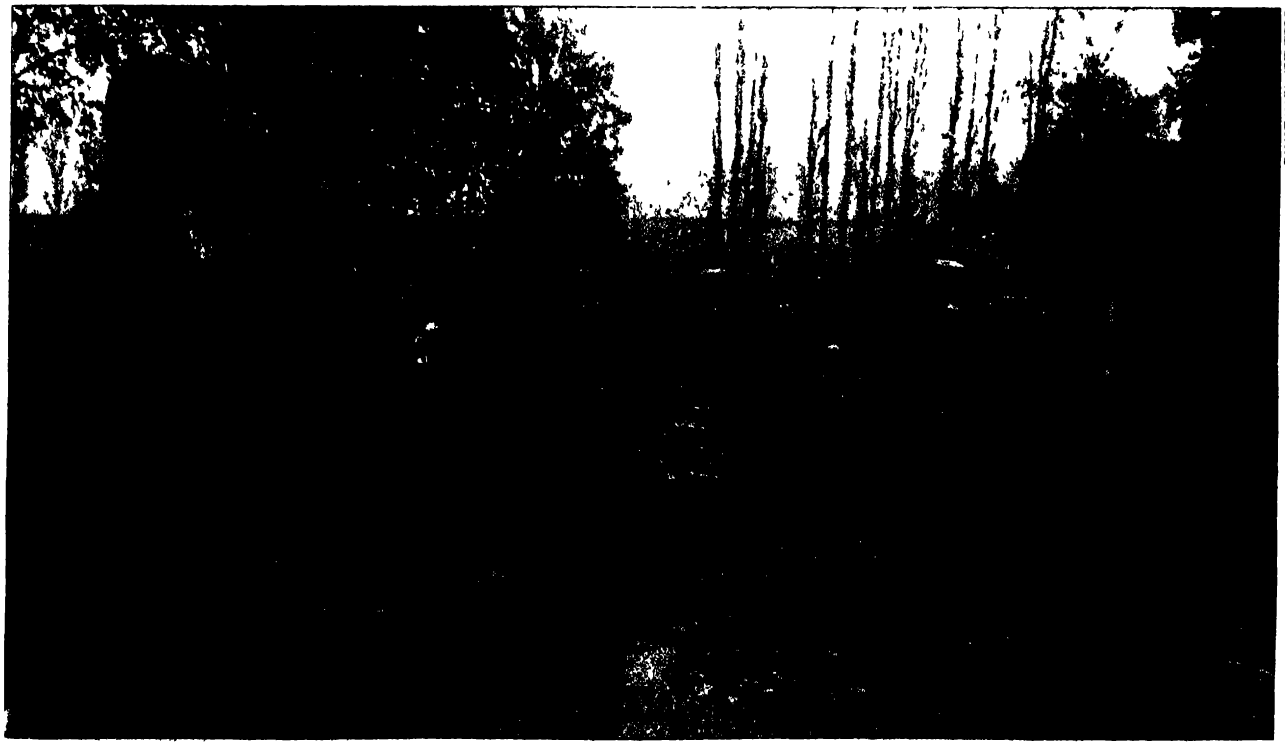
Meanwhile, the RJD has decided to abandon its alliance with the Congress(I) in the State to give itself room to contest most of the Assembly seats. Aware of its dwindling popularity and the mounting index of Opposition unity against it because of the BJP-JD(U) alliance, the RJD wants to contest as many seats as possible. The presence of the Congress(I) in the fray is likely to split the vote, particularly that of the upper castes, and RJD leaders believe that they stand to benefit from it. Indications are that the RJD will attempt to reinforce its alliance with the Left parties, particularly the Communist Party of India (CPI), ahead of the Assembly elections. The RJD and the CPI(M) had an alliance for the Lok Sabha elections, but the CPI contested separately because it was unhappy over the seat-sharing arrangement. The rift with the CPI, party leaders believe, hurt the RJD. ■

A growing toll

Amid spurious post-Kargil euphoria, the security forces in Jammu and Kashmir face a fresh terrorist offensive.

PRAVEEN SWAMI
in Srinagar

ON the morning of November 3, 15 Corps Commander Lieutenant-General Kishan Pal held a press conference to denounce media reports of an imminent escalation of violence in Jammu and Kashmir. The Army, he said, had reversed early insurgent successes after the Kargil War. Journalists, he continued, had wrongly claimed that several Army camps had been stormed by terrorists in recent weeks.



Hours later, eight Army personnel were shot dead by a Lashkar-e-Taiba suicide squad inside the Badami Bagh cantonment, a mere 10-minute walk from Kishan Pal's office.

The Lashkar-e-Taiba attack on the military operations headquarters in Kashmir, housed in a maximum security zone on the fringes of Srinagar, began at 5-45 p.m. At least three terrorists came in a hired minibus and parked the vehicle a few hundred yards from the cantonment's main entrance. One of them shot off a rifle-fired grenade which fell on a vacant plot of land. Guards responded to the explosion with confused and undirected fire, killing one Border Security Force jawan who happened to be passing by. In the melee, the hit-squad scaled the four-foot wall into Badami Bagh and hid themselves behind shrubs.

From the park, the terrorists moved forward to the Defence Ministry's public relations office, an unguarded facility. Sensing trouble, the 15 Corps' Public Relations Officer, Major P. Purushottam, locked three visiting photographers in his office toilet and went out to see what was happening. His decision saved the lives of the three photographers. The officer himself, along with seven members of his staff and a military intelligence official who happened to be in the area, were shot dead. All were unarmed. Purushottam, survived by his wife and infant daughter, was due to be posted out of Srinagar the following week.

The storming of the military operations headquarters in Srinagar is of more political than military significance. Such actions seem driven by the need to carry out high-profile actions to offset military losses.

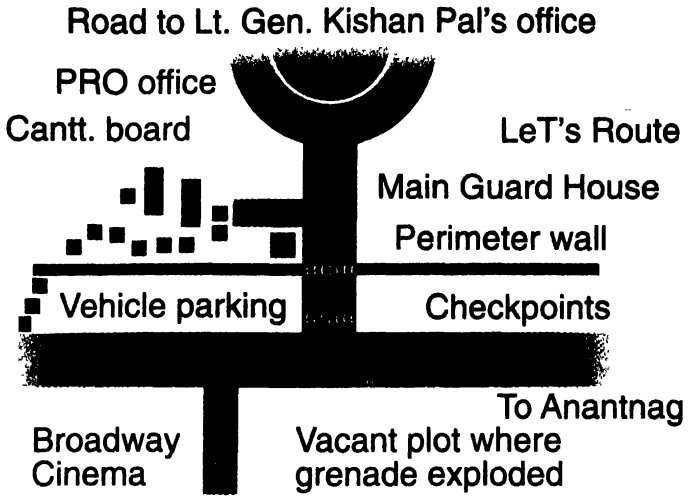
Soldiers proceeded to cordon off the area, but exchanges of fire went on until 4-30 a.m. on November 4. The terrorists blew up a building used by the Cantonment Board, next to the public relations office. The firing ended after the terrorists were attacked with rockets. At the time of writing, the body of one terrorist – identified by Army officials as that of Lashkar-e-Taiba operations chief Abu Talha – had been recovered; another body was believed to be buried under rubble. Intelligence officials, however, told *Frontline* that the terrorist's features did not correspond with their infor-

FAYAZ KABLI/REUTERS

A building used by the Cantonment Board that was destroyed by terrorists belonging to the Lashkar-e-Taiba in Srinagar on November 3.

mant's descriptions of Abu Talha.

The storming of Badami Bagh could just be the first scene of Pakistan's executive head General Pervez Musharraf's script for the Kashmir theatre. While Musharraf has engaged in skirmishes with the Jamaat-e-Islami, which accuses him of harbouring a Mustafa Kemal Ataturk-style secular agenda, here are signs that the General is promoting other fundamentalist organisations, notably the Lashkar-e-Taiba and its parent religious body, the Markaz Dawa wal'Irshad. On October 26, the Pakistani newspaper *Nawa-e-Waqt* reported that the Lashkar was planning a series of major attacks in the State to coincide with its congregation at its Muridke on the outskirts of Lahore.



It is clear that Musharraf's hawkish rhetoric on Kashmir is not just polemic. Interestingly, the Markaz convention, from November 3 to 5, had been banned by the Nawaz Sharif regime. The Markaz's chief, revanchist preacher Hafiz Mohammad Sayeed, was interviewed on Muzaffarabad-based Radio Kashmir shortly after the coup in Pakistan. The broadcast reversed the Sharif regime's efforts to distance itself from the Lashkar-e-Taiba, partly under pressure from the United States. Hundreds of Lashkar activists had been jailed in a post-Kargil crackdown on chauvinist organisations critical of the deposed Prime Minister. More than 130 Lashkar members, Indian intelligence officials say, have now been released.

In some senses, the storming in itself is of more political than military significance. Such actions seem driven in part by the need to carry out high-profile actions to offset military losses. According to Director-General of Police Gurbachan Jagat, some 1,800 terrorists are believed to have made their way into the State this summer, taking advantage of gaps created by Kargil-period troop withdrawals. Between May and September alone, 550, or almost a third of the terrorists, were shot dead in encounters. The Badami Bagh storming was preceded by an October 28 attack on the Civil Secretariat in Srinagar. Days earlier, the State Police had announced the arrest of four terrorists involved in a similar attack on September 29.

Yet it is evident that spurious post-Kargil euphoria led military officials in the State to ignore signs of trouble and instead focus on the good news. In June, following troop withdrawals, security forces lost 33 personnel in the Kashmir region, the highest figures for any month since 1996. But the return of soldiers to counter-terrorist duties, officials pointed out, had led to rapid results. September saw 159 terrorists eliminated, the highest figures for a single month in three years. Between August and October 20, security forces eliminated over 347 terrorists, again a record figure for a three-month period.

Gross numbers were not the only evidence military officials used to suggest that the renewal of the Army's presence in the State had helped undo at least some of the Kargil damage. In June, at the height of the Kargil conflict, the ratio of terrorists killed for every security force jawan lost had dipped to the lowest level since 1990. In the Kashmir region, only 1.82 terrorists were killed for every Indian security force personnel who died in combat. The figures were even worse in Jammu, with 12 security force personnel lost and 14 terrorists killed, a ratio of 1:1.14. By September, the ratio in Kashmir had gone up to 1:4.05, and to 1:5.83 in Jammu.

As the storming of Badami Bagh illustrates, it would be

A sketch detailing the area in Badami Bagh where the terrorists struck.

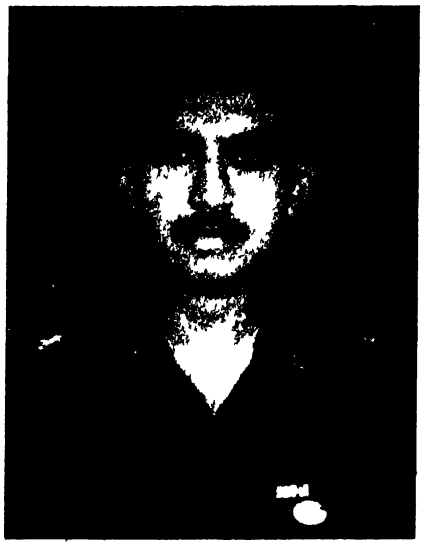
Source: Jammu & Kashmir Police



facile to suggest that a dramatic military turnaround is imminent. For one, heavy insurgent losses could be argued to be the consequence of the presence of numbers unprecedented in recent years. The losses of terrorist groups are mirrored by similar figures for India's security forces; 67 security force personnel died in Kashmir alone through August and September, the highest casualty figure for two months since 1997; 204 jawans have died in counter-terrorist duties this year in Kashmir, a figure already approximately a quarter higher than those for all of 1997 or 1998. And although 379 terrorists had been killed in Jammu this year and 580 in Kashmir, the ratios of the casualty figures of security force to those of terrorists, 1:3.51 and 1:2.84 respectively, are the most disturbing in recent years

HOW does one account for the evident escalation in the conflict after Kargil? For one, the Army appears to have been throwing significant resources at problem areas in both Kashmir and Jammu. In October, almost the entire 6 Division was used to saturate the Rajwar forests in Kupwara in an exercise code-named Operation Kaziranga. Kaziranga, sources told *Frontline*, was so large in scale that it almost provoked diplomatic panic after U.S. espionage satellites detected massive movements towards the Line of Control (LoC). The operation itself had few immediate results, for few terrorists were eliminated in its course. But the pressure in Kupwara led terrorists to scatter, and this snapped their communications.

Such operations, however, are not the first enterprises of their kind in post-1990 Jammu and Kashmir. If experience is any guide, they are no substitute for a cogent anti-terrorism policy. Official thought has, sadly, been remarkable for its lack of clarity. An early post-Kargil experiment in handing over the Army's internal security operations to Rashtriya Rifles Director-General Avtar Singh Gill was rapidly terminated for no evident reason (*Frontline*, September 10, 1999). With the creation of the 14 Corps to guard the stretch from Zoji La to the Siachen Glacier, Lieutenant-General Kishan Pal took renewed charge of anti-terrorist operations in September; the 15 Corps had earlier said it no longer wished to be engaged in the operations.

THE Farooq Abdullah Government has for its part ensured chaos in the State Police. Inspector-General of Police P.S. Gill, among the architects of the successful Special Operations Group (SOG) was moved out last month. Senior National Conference politicians had engineered Gill's removal (the Inspector-General was in charge of Kashmir in the run-up to the Lok Sabha elections), claiming that the SOG's reputation for ruthlessness was giving the State Government a bad name. Gill, however, retained charge of the SOG operations. His abrupt removal has left many SOG officers convinced that the State Government wishes to have nothing to do with counter-insurgency operations.

Most disturbing of all, Abdullah seems determined to push ahead with controversial plans for autonomy to the

Major P. Purushottom, who was killed in the terrorist attack on the Defence Ministry's public relations office in Srinagar.

State's regions, built around sundering it internally along communal lines. An official committee, led by academic Riyaz Punjabi, has been set up to give form to the proposals of the Regional Autonomy Committee (RAC) (*Frontline*, October 22, 1999). The RAC's recommendations mirrored proposals put out by several U.S-based figures, notably a think-tank called the Kashmir Studies Group, arguing for a new partition of Jammu and Kashmir along communal lines. Should the RAC proposals take effect, an escalation of communal hostilities would be almost inevitable in the State.

SO far there has been little political reaction within the State to Musharraf's rise to power. Major events in Pakistan, notably the murder of Zulfiqar Ali Bhutto and the death of Zia-ul-Haq, provoked various forms of mass protest in the Kashmir Valley.

Religious leader and former All-Parties Hurriyat Conference chief Moulvi Umar Farooq restricted himself to a carefully-worded statement on the virtues of democracy, but stopped short of condemning the coup. Most ordinary people this correspondent spoke to appeared little moved by events across the LoC. "When your own house is on fire," said telephone-booth operator G.M. Butt, "you tend not to worry about what is happening next door."

That sentiment could, however, change in the not-too-distant future. For one, the arrest of the entire APHC leadership bar Moulvi Farooq has ensured that there is no focal points for anti-India protests.

Farooq Abdullah, in a tactically brilliant but perhaps strategically flawed move, had allowed the APHC to campaign vigorously for an election boycott. Low voter turnouts in urban areas aided a National Conference victory in the elections. With the objective secured, the APHC leaders were dispatched *en masse* to prisons outside the State, on charges of aiding terrorism. Their release from jail in the not-too-distant future, however, seems probable, and the real political fallout of Musharraf assuming power could then begin to become evident

As the winter snows blanket the high mountains and forests in November, violence will, as in past years, decline in its scale and dispersion. That, however, is no reason for complacency. Musharraf's need for domestic legitimacy and his right-wing ideological beliefs are certain to propel a renewed offensive in Jammu and Kashmir. The political objectives he sought to secure by occupying the Kargil heights this summer remain, and could form the centre-piece of a fresh campaign next summer. Despite the improved state of counter-terrorist operations since August, large concentrations of terrorists, armed with heavier weapons than at any point in the past, remain on their mountain perches overlooking the State.

Next summer, India's military victory in Kargil could well face many questions. Sadly, with the State's security apparatus in disarray and with a Union Government with more pressing matters on its mind, few are paying attention either to the lessons of Kargil, or the possibilities that lie ahead. ■

Blood and tears in Kannur

For two decades, political violence has been a way of life in Kerala's Kannur district.

R KRISHNAKUMAR
in Kannur

KANNUR in north Kerala has attained notoriety in the past two decades as a region of high-intensity political violence The district has seen the kind of hatred and fear that is associated with war-torn societies Once Kannur was the homeland of the 'Chekavars', martial arts heroes who were legends in their own lifetime because of their readiness to fight and die for local chieftains Today, as political parties compete for dominance, their cadres pounce on each other

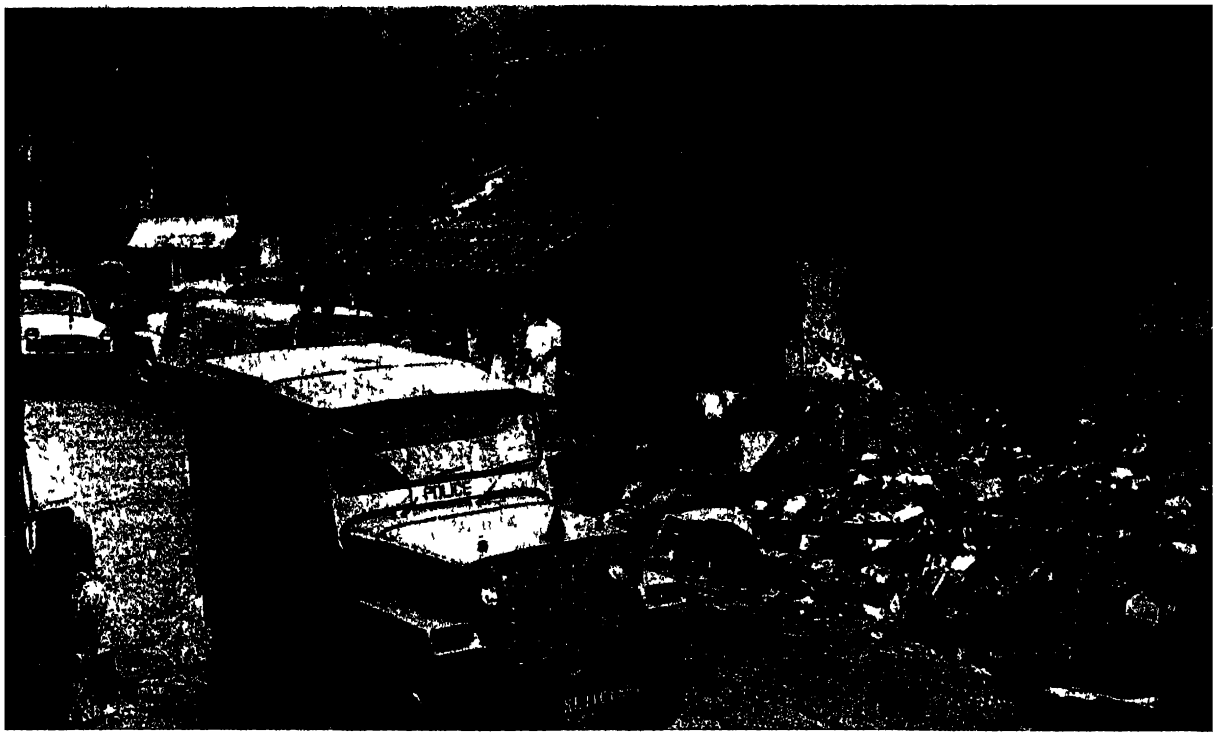
Many villages and towns in Kannur district are strongholds of the Communist Party of India (Marxist) The Rashtriya Swayamsevak Sangh (RSS) and the Bharatiya Janata Party (BJP) have been engaged with the CPI(M) in a violent battle for supremacy The RSS and the BJP hope to emerge as an alternative to the Congress(I), which also has a strong presence here

The year 1980 saw the largest number of political killings in the district The victims included 12 persons from the RSS-BJP, eight from the CPI(M), two from the Congress(I), one from the Muslim League and one person belonging to none of these groups (his killing took place as a result of mistaken identity) Since then, a rage of revenge has consumed Kannur Grief for a father or brother hacked to death or killed in a bomb attack, a son maimed for life, a sister or mother terrorised and stigmatised or houses and shops destroyed has been replaced only by more of such grief Murder for murder, a limb for a limb, or a house for a house

After a lull, violence escalated in 1997 and 1998, following the 1996 murder of BJP district secretary Pannyannur Chandran and two BJP activists at Valayam in neighbouring Kozhikode district Six persons were killed in retaliatory attacks

The situation took a turn for the worse before the Lok Sabha elections this year On August 25, Onam day, CPI(M) State Committee member P Jayarajan was attacked at his home in Kizhakke Kathirur near Thalassery by a group of 15 assailants, allegedly RSS workers It was a planned attack, typical of the violence in Kannur an explosion lures Jayarajan and his wife out of their house, a bomb is thrown at him to drive him back, and he is then hacked with daggers He was left for dead, but he survived

Despite the need for restraint during the final phase of the election campaign, the ruling CPI(M) and the RSS-BJP began retaliatory attacks in Kizhakke Kathirur, the volatile Panur area and, in several other parts of the district After the elections, revenge and retribution began in right earnest



According to one estimate, in the last 20 years, nearly 120 persons, most of them activists or supporters of either the CPI(M) or the RSS, have been killed in political battles in Thalassery taluk alone Pattayakkunnu in Pattiyam panchayat, one of the most sensitive areas, is an example of how an entire society has been divided by politics A narrow road at the main junction at Pattayakkunnu manned by a sizable police picket, divides 'them" and "us' To the right is Konkachy, an RSS-BJP pocket and an island surrounded by CPI(M) bases Repeated attempts by the RSS to open *shakhas* elsewhere in the area have been foiled The efforts continue, nevertheless, making neighbours fearful and distrustful of each other

RANJITH VAMAN

Former Supreme Court Judge V.R. Krishna Iyer, second from left, on a peace mission in violence-torn Aythara in Kannur district in late October.

A day after the expiry of the prohibitory orders that were imposed in the area following the September 17 elections, according to witnesses, RSS-BJP and CPI(M) groups threw bombs at each other and at the police and at shops belonging to their rivals The local people are reluctant to speak about the incidents. If at all they speak, they do so in absolute privacy and on condition of anonymity. One of them said that the atmosphere in the village had become sti-

A building damaged in clashes at Kanhillery.

fling since workers of the former Socialist Party, which opposed the Communists and the Congress(I) had joined the RSS *en masse* and set up base at Konkachy. All houses in that area belong to RSS sympathisers. Otherwise, he said, "they will not live there peacefully for long." Similarly, in the surrounding CPI(M) strongholds, rival political leanings are not "tolerated". Gatherings of people not connected to the party are "discouraged, one way or another". A young man said that even a club they had formed for everyone, irrespective of political affiliation, had been bombed. "If you talk to a person who sympathises with another party, then you are viewed with suspicion," he said.

According to a shopkeeper, many men in Konkachy have long since gone into hiding. Another resident said: "Earlier they used to come for dinner under the cover of darkness. Now they are afraid. Women live in terror. They are threatened frequently."

A local BJP leader told *Frontline* that he had stopped playing an active role in party activities. He said: "A group of young men from outside have taken charge. They disregard saner elements in the party and are often at the forefront to seek revenge. It is only a handful that create all the trouble. The CPI(M) machinery in the area is also similarly fine-tuned to attack or seek revenge. The police stand as mute spectators and are often helpless before armed gangs."

The police and CPI(M) activists and sympathisers fear to tread anywhere near Ayithara on the outskirts of Koothuparamba municipality. This is an "RSS fortress", where the RSS office building, named after the organisation's founder K.B. Hedgewar, is strategically located on a wooded hill, which enables access to several panchayats. On October 12, a 150-strong mob surrounded Hedgewar Mandiram and hurled bombs, injuring two RSS workers. While one person suffered serious burns and his right arm was nearly severed, another was stabbed. The RSS local *saha karyavah*, who was rushing out of a *shakha* meeting, was killed on the spot. A bomb exploded after hitting his neck.

The front door of the building has a gaping hole from an explosion. The whitewashed walls of an anganwadi nearby bear stains of blood that was splattered on them. According to the police, an RSS activist was chased into the premises and hacked to death. Two houses, of CPI(M) sympathisers, were pulled down and gutted.

Koothuparamba area secretary of the CPI(M), M.O. Padmanabhan, told *Frontline* that houses near the *shakha* premises belonged to RSS sympathisers, barring a few. "Young men in these few houses have gone into hiding, women and the aged have been terrorised. RSS men start their daily drill from 5 a.m. in an adjoining school compound and then sit right in front of the toilet of a house nearby until almost noon. The women in the house have been undergoing this psychological torture for months." The attack on Hedgewar Mandiram is said to be in retaliation for this.

Three houses of CPI(M) activists near Hedgewar Mandiram were soon pulled down and set afire. C. Kunjikkannan, an ex-serviceman whose house was damaged, said that he and his daughters were alone in the house when the attack came at night. "Terrified, we climbed upstairs but soon realised that they had set fire to the house. So we tried to run out. I could run only halfway to the police picket. We had a providential escape. The house, which was only partially damaged then, was gutted completely by the next day," he said.

His daughter said that the attackers had been armed with iron rods and daggers. Some people were hit on the head but escaped death. A young woman said that her certificates right from secondary school to the post-graduate level, were burnt. "The assailants were all known to us for years and I kept asking them why they were doing this. They said I had better run for my life."

The happenings at Ayithara may be a "minor incident" by Kannur's standards, but it is typical of the situation in the district, where politics is worse than extreme communalism and political beliefs acquire the nature of superstitions. Unknown to the outside world, villages and small towns, especially in Thalassery taluk, are therefore breaking down under the weight of hatred, distrust and fear. An

impression has gained ground that the leaders of political parties are sidelined as personal rivalries become politicised and cadres take it upon themselves to settle scores. Moderate voices are brushed aside

In the two-decade history of the violence, there has been no report of people having left political parties because their cadres indulged in large-scale violence. On the other hand, there are several instances of a party losing support or its programmes facing indifference whenever it decided not to counter violence with violence. It is a problem the Congress(I) has experienced in the district often, especially in areas where the CPI(M)-RSS rivalry is predominant. (Recently the party decided to resort to violence to gain political mileage, but the experiment was short-lived and its leaders soon found themselves embroiled in a series of criminal cases.)

RANJITH VAMAN

At Aylthara, the destroyed home of a CPI(M) worker.

State general secretary of the Kerala Congress (Mani), P.T. Jose, said: "So long as one side is able to find more supporters by reacting through violence and another tries to annihilate all those who threaten its base, political parties, irrespective of their public statements, have a vested interest in continuing this violence. Peace efforts are welcome but can at best bring only temporary relief. The wounds of the past continue to fester. It is a vicious circle from which parties may find it difficult to break away."

The RSS, which has perfected the art of guerilla warfare in the CPI(M) strongholds, has claimed that it practised "restraint", especially when it suffered serious "setbacks" (for example, after an entire set of its leaders have been annihilated) and needed time to recoup. The organisation showed "restraint" for more than a year after the murder of Pannyannur Chandran and two other BJP workers at Valayam in 1996.

Its failure to retaliate led to an erosion in its support to such an extent that the BJP was unable to get a respectable crowd for its public meetings in the area.

It is this perception of possible loss of support that perpetuates the political violence in Kannur. Shocking as it may seem, there are indications that despite the persistent threat to civil society and peace, the tit-for-tat responses have gained admirers for the parties involved.

According to the CPI(M) MLA from Kode, T.K. Balan, the RSS' antipathy to the CPI(M) started during the communal riots in Thalassery in 1972 when the RSS attacked people of the minorities and CPI(M) cadres came to the latter's rescue. He said that the RSS-BJP's grouse against the CPI(M) was political in a way because they wanted to expand their influence in a communal way. In most areas, the CPI(M) stood between them and their objectives, he said.

The State secretary of the Democratic Youth Federation of India (DYFI), M.V. Jayarajan, said that it was not in the CPI(M)'s interest to engage its cadres in violence when it had got more than 52 per cent of the votes in any election in the area. "There is no reason why we should try to use violence against the BJP-RSS, which has only small pockets of influence. But they indulge in armed training under the leadership of outsiders who are sent here with the agenda of weakening the CPI(M) politically and pursuing the larger aim of attacking the minorities."

District secretary of the BJP, P.P. Karunakaran, said: "Did we not restrain ourselves for nearly one and a half years, following the death of Pannyannur Chandran and the peace agreement reached at a conference convened by the Chief Minister? But the CPI(M) used that opportunity to crush us by not allowing us to pursue political activities. We are forced to react."

A new dimension has been added this year with a spate of bomb attacks and threats against the police, who, the BJP-RSS and the Congress(I) have been alleging, and biased in favour of the CPI(M). So far the violence had been directed against rival party workers. According to CPI(M) leaders, several police officers have recently received letters (allegedly in the name of the Bajrang Dal) threatening them with dire consequences if they took action against RSS-BJP activists and supporters.

As in the past, several independent peace initiatives have been launched after the recent round of killings. The latest came on October 27 under the leadership of former Supreme Court Judge V.R. Krishna Iyer. He told *Frontline*: "Both sides claim that their desire is peace. But their actions are quite to the contrary. A day after the peace initiative was launched, a man was attacked and another was beaten up with iron rods in retaliation." But he still expresses the hope that the peace efforts will show results. Krishna Iyer has obtained an assurance from the political parties that they will refrain from reacting to incidents violently and will wait for two months to give the police and the peace initiators a chance. District leaders of the CPI(M) and the RSS-BJP have agreed not to make the first move to violate the agreements reached at the peace talks.

T.K. Balan, who represented the CPI(M) at the peace talks in Thalassery, said: "One of the first requirements of lasting peace in Kannur is for the RSS to stop its armed training." C. Chandrasekharan, the RSS regional secretary for Kannur and Kasaragod said: "The CPI(M) should realise that peace does not mean submission or surrender."

Former Muslim League MLA from Peringalam, K.M. Soopy, who represented his party at a peace initiative, said: "Often the top leadership of both parties, even those at the district level, come to know of an incident only after it has occurred. They have no role in its planning or execution. After the event the leaders are forced to support the action of the cadres, irrespective of whether they approve of it or not. Significantly, in areas such as Pattayakkunnu, Konkachy, Thrippangottur or Kunnothuparambu, workers of the former Socialist Party, who had an old rivalry with the Communists, have joined the RSS-BJP *en masse*."

Krishna Iyer said: "Wars begin in the minds of men. People should change their attitudes if there is to be lasting peace in Kannur." ■

Issues and the verdict

An analysis of the beliefs, opinions and perceptions of the electorate that shaped the verdict of Elections '99.

YOGENDRA YADAV
with OLIVER HEATH
and ANINDYA SAHA

The third instalment of a series of analytical articles based on a post-election survey conducted by the Centre for the Study of Developing Societies (CSDS), Delhi, and co-sponsored by *Frontline*. The earlier instalments were published in the preceding issues. The series will continue into the next issue.

IN the previous parts of the State-wise analyses of the verdict in the 1999 Lok Sabha elections, investigators of the Centre for the Study of Developing Societies (CSDS) looked at the mechanics of the verdict in terms of the relationship of votes to seats and voting behaviour to the voter's social background. But that does not complete an interpretation of the results, for voting is a conscious act. The results did not merely reflect the social background of voters and the mechanics of the vote-seat relationship. They constituted a verdict on the dominant political issues and disputes. But this aspect of the verdict is not self-evident. The election results tell us precisely who won and how many votes and seats were won, but they do not tell us which ideas won and why. We need to draw upon our survey to uncover the meanings embedded in the electoral verdict.

Here, we report some findings regarding the beliefs and opinions of the electorate.

A logical place to begin with is the area of foreign policy, particularly salient in this round of elections owing to, first, the Kargil War, and secondly, the Pokhran nuclear tests. At the end of November 1998, the Congress(I) swept the Assembly elections in two States and Delhi and until a few months after that opinion polls predicted a victory for the Congress(I) if a general election were to be held. But what happened? Did Kargil play a role similar to the one the Falklands war played in the British elections in 1983 (that war is widely assumed to have handed

victory on a platter to Margaret Thatcher's Conservative Party)? To gauge the actual effect of Kargil in determining the outcome of the elections may be beyond us. What we can do is to make a tentative estimate using data from the post-election survey conducted by the CSDS.

The first thing to note is that only 65 per cent of our sample said that they had heard of the war. Although this section represents a significant proportion of the electorate, it shows that the skirmish did not penetrate public consciousness as deeply as is assumed.

Overall, 42 per cent of the respondents said that they were satisfied with the government's action in Kargil, whereas 13 per cent said that they were not. Unsurprisingly, the majority of those who were satisfied voted for the Bharatiya Janata Party and its allies, at 55 per cent, and the majority of those who were dissatisfied voted for the Congress(I) and its allies, at 54 per cent. But this by itself does not indicate whether the conflict played a role in determining which party the voters favoured. It could merely be re-describing party loyalties, as the causal direction between the two is unspecified. To find this out we asked our respondents whether the events in Kargil had had an effect on their voting decision. A significant proportion, 15 per cent, responded that they had.

The 15 per cent who said that Kargil influenced their vote: 71 per cent voted for the BJP-led alliance and 25 per cent for the Congress(I) and its allies. This contrasts sharply with the division of vote for the parties among citizens who said that either it did not affect their vote or they had not heard about Kargil – 36 per cent for the BJP and its allies and 39 per cent for the Congress(I) and its allies.

The Kargil factor displayed both positive and negative consequences for the BJP: it elicited a protest vote from some people and a vote of endorsement from others. Of the respondents who were unhappy with the government's action and said that it affected their vote, there was a stronger tendency towards the Congress(I), both in terms of the proportion of the vote that it retained from 1998 and in terms of voters who shifted to it from the BJP. On the other hand, out of the respondents who were satisfied with the government's action and who said that Kargil had influenced their vote, there was a strong swing towards the BJP. The party retained 86 per cent of its vote; 27 per cent of the Congress(I) voters of 1998 shifted to it. However, since on balance there were more people who were satisfied than dissatisfied with the government's action on Kargil, the BJP made a net gain out of the conflict.

On the second foreign policy issue, the Pokhran tests, the findings reveal that despite the massive media coverage, the majority of Indians have not heard about them. Of those who have, there is general approval of the government's policy. There is also a high degree of approval for increased spending on the Army, even if that means hardships for the public. There is clearly a shadow of Kargil here. But, interestingly enough, these opinions do not translate into support for an aggressive foreign policy *vis-a-vis* Pakistan: the idea that India must make greater efforts for friendly relations with Pakistan is supported by 42 per cent of the respondents. This represents a mere three percentage point drop since 1996, which, in the light of the occurrence of the Kargil War in the intervening period, is a remarkable statistic.

The question as to whether war is the only solution to the Indo-Pakistan dispute is answered in the negative by 39 per cent of the respondents and in the affirmative by 25 per cent. Overall it would appear that the electorate wants the nation's honour and its boundaries to be protected but is not prepared to endorse aggressive militarism *vis-a-vis* India's neighbours.

The experience of having had a succession of coalition governments over the last few years seems to have diminished the electorate's antagonism towards coalitions. There is now wider

acceptance of coalitions, with an increase in the number of those who say that there is nothing wrong with them and a decrease in the number of those who think that they should not occur under any circumstances. This is good news for the BJP-led alliance and bad news for the Congress(I). Congress(I) voters are the most opposed to coalitions; 29 per cent of them said that there should be no coalitions under any circumstances. About 30 to 32 per cent of voters of parties with a history of coalition culture, such as the Left parties and the BJP, favoured coalitions. Somewhat surprisingly, more BJP voters said that there should be no coalitions. Those who were the most undecided on coalitions were Congress(I) and BSP voters, 42 and 46 per cent respectively.

There has been a change in the identification of the voter with the region as distinct from the nation. The majority of the respondents, at 50 per cent, are prepared to go along with the suggestion that one should be loyal to one's own region first and then to the nation. They include 56 per cent of those who have voted for the BJP's allies and 48 per cent of those who voted for the BJP itself. This orientation does not quite square up with the BJP's ideology of nationalism but, interestingly enough, is fully compatible with its strategy of building alliances with regional parties. The voter's enhanced identification with his or her own region should not be taken as a sign of exclusivism or separatism; it rather appears to be a reasonable response to a regionalised party system where the effective locus of political choice has shifted to the State level.

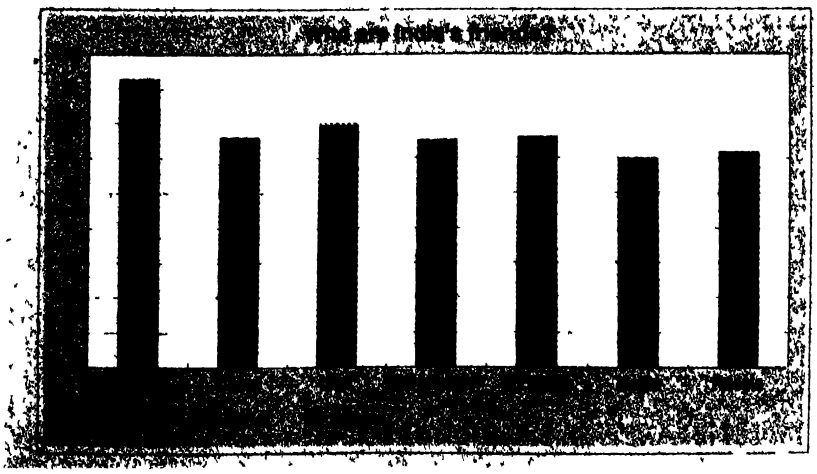
In addition, voters are more interested in their State governments than in the Central Government. Between 1996 and 1999, while the percentage of interest in both the State and the Central government increased, the relative proportion between the two did not.

A look at the popular level of satisfaction with the BJP-led government, as the table indicates, shows a solid but by no means overwhelming pattern. However, opinions on this are sharply divided along partisan lines. Of the Congress(I) voters, 38 per cent are not at all satisfied; the corresponding figures for Left and BSP voters are 45 per cent and 36 per cent respectively. In sharp contrast, the figure for BJP voters is just 7 per cent.

A comparison with the ratings of the Congress(I) and United Front governments at the end of their regimes shows the BJP-led government in better light. When the voters were directly asked to compare the previous three governments and say which one of them was the best, the BJP-led government emerged the clear winner. That raises a question: what exactly did the people like about the BJP-led government?

This calls for a closer look at various spheres of the government's performance as perceived by the electorate. People do not seem to have a very positive opinion of the government on its record in controlling inflation. Overall, nearly 80 per cent of the voters felt that the prices had gone up. The partisan difference on this is as follows: 84 per cent of Congress(I) and 85 per cent of Left voters think the prices have gone up, but the corresponding figure for BJP voters is 67 per cent.

The government was also not seen to have a strong rating on the issue of corruption, with only 39 per cent of the electorate saying corruption had declined. Again, it was BJP voters who were more inclined to give a generous rating to the government's performance, with 43 per cent of them saying that the level of corruption had come down. The figure for Congress(I) voters was 22 per cent and that for the Left voters was 26 per cent.



Did Hindu-Muslim relations improve under the Vajpayee-led government? Overall, 37 per cent of the electorate thought so. This figure was significantly higher, at 45 per cent, among BJP voters than it was among Congress(I) and Left voters, the figures for whom were 33 per cent and 31 per cent respectively. Another issue related to the treatment of minorities came up in response to the survey question on whether Christians had been treated unjustly by the previous government. While the majority held no opinion, marginally more people, at 23 per cent, felt that such injustice had occurred, compared to 20 per cent who felt that it had not. Among BJP voters, only 18 per cent agreed that there had been such injustice. Among the Congress(I) voters the figure was higher, at 26 per cent. A sharper reaction to this issue was manifested in the response of Left

Perceptions of the world

SINCE this round of Lok Sabha elections saw foreign policy become something of an issue, the CSDS survey tried to find out the attitudes of ordinary people about some countries that matter to India. Each respondent was asked whether he or she was familiar with the names of those countries. The respondents who answered 'yes' were then asked to state whether in their opinion that particular country was India's friend, enemy, or neither. Unsurprisingly, in the wake of the Kargil War, Pakistan emerged as the country the largest number of respondents had heard about. On this count, every other country ranged between 60 and 70 per cent.

Unsurprisingly again, Pakistan was identified as an enemy by the majority of the respondents. Generally Indians do not seem to perceive a serious threat from any country other than Pakistan. China was identified as an enemy by 13 per cent of the respondents, but then some 22 per cent thought of it as a friend. The rating of the United States is not particularly better than that of China.

Russia still emerges as the country considered most friendly to India. The memory of Indo-Soviet friendship perhaps still works for Boris Yeltsin's Russia. ■

Participatory upsurge of the oppressed

CSDS Team

WITH the country having witnessed five general elections in 10 years, it is not surprising that one hears about "voter fatigue". The media have often carried reports about an electorate that is disenchanted, disinterested and simply apathetic. However, the voter turnout figures for the September-October elections do not quite support such a reading. Despite there having been four mid-term elections, the overall voter turnout in this decade has been no different from that in earlier decades. In fact, an analysis of the facts about people who vote and those who do not has shown a participatory upsurge of the lower orders in this decade. The sections of society that were previously been kept outside political power – backward classes, Dalits, women, tribal people – are participating much more in the electoral process. Although the urban, educated elite is experiencing depoliticisation, the upsurge of the lower orders has kept the overall voting levels fairly high.

Since the turnout patterns have been discussed in the first part of this series ("The Turnout Factor", *Frontline*, November 5), here the focus is on attitudes and behaviour other than voting. About one-third of the respondents took some or a great deal of interest in the campaign in this round of elections, which is not very different from the level of voter interest in the 1971 or 1996 elections. It is a matter of concern that two-thirds of the electors took no interest at all in the elections; yet it may not be correct to say that this indifference is a new phenomenon. In any case, it does not imply that the ordinary citizen does not value his or her vote. The proportion of citizens who feel that their votes make a difference to the way in which the country is run rose from 48 per cent in 1971 to 59 per cent in 1996 and further up to 63 per cent in 1999.

Most Indians are not interested in the election campaign

Most Indians think that their vote makes a difference

	1971	1996	1999
No difference	16	21	18
Has an effect	48	59	63
Don't know	35	20	20

Participation in politics

	1971	1996	1998	1999
Attended meetings	12	16	25	22
Was canvassed	41	43	42	49
Took part in campaigning	10	9	13	21
Feel close to any party	37	31	NA	38
Member of political party	4	6	NA	8

A look at the various participatory activities confirms this picture. The proportion of voters who attended at least one election meeting was higher in 1999 than in 1996, though it is a little lower than the figure for the previous elections. The percentage of respondents who were visited by a canvasser also increased in the 1999 elections as compared to the previous two elections, perhaps because the campaign period this time was much longer. The number of those who actually took part in the election campaign on behalf of a candidate was much higher than ever before.

Notwithstanding widespread disenchantment with political parties, the percentage of voters who feel close to a political party remains as high as in 1971, and has actually registered an increase since 1996. It seems that the proliferation of smaller parties, which often have specific social groups as their support bases, has tended to draw greater numbers into developing enduring partisan identifications.

It must, however, be pointed out that in comparative terms the level of party identification in contemporary India is much lower than in Western democracies. Each election witnesses a very high level of exchange of votes across party lines, leaving a relatively small proportion of 'loyal voters'. Not much has changed in the 1990s in this respect.

Finally, if one looks at party membership, the most advanced form of political identification, the survey reveals a consistent increase in reported membership. The proportion of those who report to being a member of a political party in 1999 is more than double that recorded in 1971. This compares favourably with Western democracies. While the public, no doubt, has reservations about politicians and political parties, the Indian passion for politics is far from dead. ⌐

voters, of whom 41 per cent agreed with the suggestion BSP voters, by contrast, were relatively indifferent, with only 11 per cent of them agreeing.

Response by religion yielded an even sharper reaction to this question. As many as 68 per cent of the Christians among the respondents felt that injustices had been committed against them. This figure was substantially higher than that for both Hindus and Muslims, most of whom responded with 'Don't know'. Twenty per cent for Hindus and 30 per cent for Muslims who expressed an opinion tended to agree that such injustices against Christians had occurred.

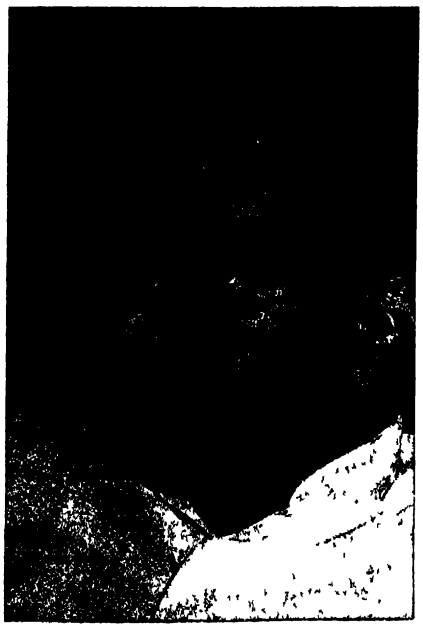
The percentage of people who express an opinion on who should be the next Prime Minister has substantially increased over the course of the last three elections, with the number of 'Don't knows' dropping from 47 per cent in 1996 to 16 per cent in 1999. This indicates that in 1999 party leaders were more firmly rooted in the public consciousness than they had been in 1996 and 1998.

A.B. Vajpayee had more cross-party appeal than Sonia Gandhi and was named the preferred choice for Prime Minister by 10 per cent of the voters of the Congress(I) and its allies, compared to just 3 per cent of the voters of the BJP and its allies who named Sonia Gandhi.

Sonia Gandhi's foreign origin was responsible for much mud-slinging and the formation of a new political party. The proportion of the electorate who deemed her unsuitable to become Prime Minister because of her foreign origin was 15 per cent. In the light of the media attention surrounding this issue, it is perhaps surprising that the number is not very high. On the whole, the majority of those who felt that Sonia Gandhi was unsuitable for prime ministership cited pragmatic political reasons, such as inexperience or poor communication skills. But the significant fact remains that as much as 35 per cent of the electorate would not consider her for the job. ■

The case of Eric Soundranayagam

Was a Jaffna youth involved in the killing of Dr. Neelan Tiruchelvam captured in Chennai by the police and taken to Sri Lanka?



D.B.S. JEYARAJ

THERE is much anxiety-ridden speculation among Sri Lankan Tamils in Sri Lanka and abroad over allegations that a Sri Lankan Tamil youth was arrested in Chennai and then deported through "extra-legal" means to Colombo in mid-October. Controversy rages around the fate of 27-year-old Eric Soundranayagam, a native of Chunnakam in Jaffna, who is, according to police sources, being interrogated intensively by investigators in Colombo about his alleged role in masterminding the assassination of former Tamil United Liberation Front (TULF) parliamentarian Dr. Neelan Tiruchelvam. The circumstances under which Soundranayagam, described as a Liberation Tigers of Tamil Eelam (LTTE) operative, came to be placed under Sri Lankan official custody are shrouded in mystery. Allegations have been made in the Sri Lankan media in this matter that improper procedure was adopted by Indian and Sri Lankan officials. On the other hand, there have also been reports in the newspapers that he was arrested after he arrived in Sri Lanka from India. The controversy took a new turn with media reports claiming that Soundranayagam was also suspected of having been in India to plot the assassination of Congress(I) president and Leader of the Opposition in the Lok Sabha, Sonia Gandhi.

The assassination of Dr. Tiruchelvam on July 29 this year initially left Sri Lankan investigators groping in the dark. While the suicide bomb method and advance intelligence reports clearly pointed to the LTTE's role in the crime, sleuths found themselves unable to detect persons actually involved in the planning and execution of the investigation. This pronounced delay impelled President Chandrika Kumaratunga to call for a status report on the investigation and order speedy action. Thereafter reports appeared in the Sri Lankan media quoting police sources that some LTTE suspects had been arrested and an LTTE safehouse in Colombo detected.

Subsequent news reports said that the man who had monitored Dr. Tiruchelvam's movements and drawn up the blueprint for the assassination was Soundranayagam. It was said that after planning the murder, Soundranayagam had gone to Chennai. According to these reports, he is an old student of Union College in Tellippalai, Jaffna. Another LTTE operative, Kathiravan, was also an old student of Union College. Chief of the LTTE's intelligence wing, Pottu Amman (charge-sheeted in the Rajiv Gandhi assassination case), communicated through Kathiravan with Soundranayagam. The latter was working at a private telecommunications centre in the predominantly Tamil neighbourhood of Wellawatte, and at the same time studying in the Colombo Technical College.

All these facts had been gleaned from Kathiravan and Kamalan, an associate of Soundranayagam at the communications centre, both of whom were in police custody. Reports also said that Soundranayagam had left for India in the first week of July. He had, however, telephoned Kamalan from India after Dr. Tiruchelvam's death and allegedly boasted that he had masterminded the killing. Once the Colombo media started publishing details about Soundranayagam's alleged role in the killing and also stated that he was in India, the expectation was that his capture would be virtually impossible. In fact, there was even suspicion that the police, who were under pressure from President Kumaratunga to produce results on the investigation, "planted" this story as a red herring.

Dr. Neelan Tiruchelvam.

The next twist came when Kumar Ponnambalam, a Tamil lawyer who is also the general secretary of the All Ceylon Tamil Congress, sent a letter by fax to President Kumaratunga and also released it to the press. Ponnambalam has in recent times acquired an image of being an ardent sympathiser and unaccredited spokesperson of the LTTE. Ponnambalam drew attention to an alleged incident concerning Soundranayagam – that he had been informed of certain incidents by Soundranayagam's maternal uncle in Denmark. Thereafter Ponnambalam had made his own investigations, in the course of which he contacted "friends" in India. His faxed letter to Kumaratunga was based on information that was thus gathered.

Ponnambalam said that Soundranayagam had gone to India in the first week of July to attend his sister's wedding, after obtaining a visa from the Indian High Commission. He stayed in Chennai for a while after the wedding. On October 8, Soundranayagam went to Tiruvanmiyur, in Chennai, to meet Fr. Samuel Gerrard, who had solemnised his sister's wedding. Ponnambalam alleged that Soundranayagam was taken into custody at Tiruvanmiyur by Indian police officials. Subsequent inquiries by relatives revealed that he had been handed over to officials of the Sri Lankan National Intelligence Bureau, on October 16, according to him.

Ponnambalam also alleged that passengers on the Sri Lankan Airlines Flight No. 132 from Tiruchi in Tamil Nadu to Colombo on October 16 had seen a young, lean Tamil in his twenties seated with three armed Indian police officials at the airport departure lounge. Later the

SRIYANTHA WALPOLA

The scene of Neelan Tiruchelvam's assassination on July 29, 1999.

same person was seen seated with Sri Lankan security officials in the rear of the plane. The curiosity of the passengers was further aroused when it was noticed that the Tamil youth had not passed through immigration. An ambulance was also seen on the runway when the plane landed in Colombo, Ponnambalam said.

On the basis of this information, Ponnambalam wanted President Kumaratunga to make clear whether it was Soundranayagam who was seen on the Sri Lankan Airlines flight. Ponnambalam also wanted Kumaratunga to state whether Soundranayagam or somebody else was being extradited to Sri Lanka and if so, whether proper legal procedure was being followed.

The media publicity surrounding this alleged episode has troubled sections of the Sri Lankan Tamil community to some extent. It was quite galling to those of LTTE persuasion. If the incident was true, it was in their perception a great "let-down" by India. These feelings were exacerbated by their reactions to the Lok Sabha elections in India. The return to power of the Bharatiya Janata Party was hailed, as the party is considered to be somewhat sympathetic to the predominantly "Hindu" Sri Lankan Tamils. Furthermore, the BJP's allies such as the Shiv Sena, the Marumalarchi Dravida Munnetra Kazhagam, the Pattali Makkal Katchi and the Samata Party, which is now a part of the Janata Dal (United), were looked upon as "LTTE-friendly". Thus there was jubilation in pro-LTTE Sri Lankan Tamil circles that the new Indian dispensation would be favourable to the LTTE.

Naturally, hardline Sinhala sentiment feared a pro-LTTE tilt in India's stand. Although the Dravida Munnetra Kazhagam (DMK) had been distancing itself in recent times from the militant Sri Lankan Tamil groups' cause, the party too was looked at with suspicion by Sinhala hardliners. All this led to the Sri Lankan Government seeking and obtaining an assurance from India that there was no change in its Sri Lanka policy.

Therefore, the controversy regarding the alleged role of Indian officials in the Soundranayagam affair was very unwelcome from the pro-LTTE Sri Lankan Tamil point of view. Did India really arrest and deport an LTTE suspect without following the usual procedures? If true, it was a bitter pill for the LTTE'S sympathisers to swallow. All the media hype about an LTTE-friendly government in New Delhi was negated. To what extent were the Union Government and the Government of Tamil Nadu involved in the exercise? The Sri Lankan Tamil media, particularly the overseas journals that are either controlled or influenced by the LTTE, were indignant.

There were three broad types of reaction. The first was to absolve the Central and Tamil Nadu governments of the "blame". It was alleged that Indian espionage agencies were the villains of the piece. A variant was to blame the Q Branch of the Tamil Nadu police. It was also insinuated that Indian policemen had been bribed by Colombo and that the whole affair was done clandestinely, without official sanction. Some names were mentioned.

The second type of reaction was to state that the whole incident had been managed by the law-enforcement agencies of both countries on an official-to-official level. Neither the Central nor the Tamil Nadu government was aware of this. Had the government been aware, it would not have allowed the development to occur considering the political repercussions that could follow. Now that the matter had become public, there would be remedial action. The officials responsible would be penalised. It was expected that the LTTE's "friends" in the government would raise hell over the issue.

The third type of reaction was that the whole incident was managed at a government-to-government level. It was alleged that procedures had been initiated through the diplomatic missions. Cabinet Ministers and the State Government were in the know. Although officially sanctioned, it was kept low-key to avoid embarrassment to Tamil Nadu Chief Minister M. Karunanidhi. It was recalled that in the 1970s the DMK chief was accused of deporting the well-known militant Selvarajah Yogachandran alias "Kuttimani" to Sri Lanka while he was Chief Minister. It was then argued on Karunanidhi's behalf that he was ignorant of Kuttimani's actual role. So in order to avoid similar charges, the Soundranayagam incident was being kept under wraps. it was stated.

Whatever the reasons attributed by the pro-LTTE media for the manner in which the alleged exercise was conducted, it seemed that there was unanimity of opinion that it was a triumph for Sri Lankan and Indian investigators. Information had purportedly been gathered and exchanged to carry out the arrest. It was alleged that the Indian police, acting on tip-offs from Colombo officials, had traced Soundranayagam and then detained and interrogated him.

After being satisfied about Soundranayagam's alleged involvement in LTTE activity, they handed him over to their Sri Lankan counterparts in Tiruchi, who took him back to Sri Lanka. Officials of both countries were unable to

Claims and denials

T.S. SUBRAMANIAN
in Chennai

DID the Tamil Nadu police arrest Eric Soundranayagam and hand him over to the Sri Lankan police in Chennai or did the Sri Lankan police arrest him in Colombo? There is no definite answer to this question, but one thing is clear: Soundranayagam did come to Chennai a couple of weeks before the assassination of Dr. Neelan Tiruchelvam and stayed in India for nearly three months before he was allegedly taken in by the police in the first week of October.

Dr. Tiruchelvam, Member of Parliament and Vice-President of the Tamil United Liberation Front (TULF), was killed by a Liberation Tigers of Tamil Eelam (LTTE) suicide bomber while he was travelling in his car. The assassination of this brilliant self-effacing intellectual and public figure, who tried to find a non-violent solution to the Sri Lankan Tamil problem, drew strong condemnation and once again inflamed public opinion against the LTTE.

Informed sources in a Sri Lankan anti-LTTE Tamil militant group in Chennai asserted that the Q branch of the Tamil Nadu police arrested Soundranayagam in Chennai on October 5, handed him over to the Sri Lankan police in Chennai, and escorted him in a flight from Tiruchi to Colombo. A top Tamil Nadu police officer, however, denied this and said: "He was not arrested in India. He was arrested in Colombo by the Sri Lankan police." The officer added: "We have called for an explanation about how we missed him here." He alleged that stories had been planted in the newspapers about Soundranayagam's arrest in Chennai.

Informed sources said that Soundranayagam had played an important role in the preparations leading to the assassination of Dr. Tiruchelvam. According to them, he was detailed by the LTTE's intelligence wing chief, Pottu Amman, to track the TULF leader's movements. He took up a job in a telephone booth at Wellawatte in Colombo, kept watch on Dr. Tiruchelvam and passed on information to the LTTE squad, which despatched a Black Tiger on a suicide mission.

Coming to Chennai about two weeks before the assassination, Soundranayagam reportedly stayed for about a week with Vimalraj, a Sri Lankan Tamil, at 64 Anna Street in Tiruvanmiyur. Police interrogated Vimalraj, who shifted to another place on October 22. The sources rebutted the version that Soundranayagam was arrested at his sister's wedding in Chennai. They also discounted media reports that he was looking for a job as a newspaper reporter in India.

There are two rows of tenements on door numbers 64 and 65, Anna Street, Tiruvanmiyur, where working class people live. A narrow footpath separates the tenements.

The house-owner, Dakshinamurthy, himself has now moved into the tenement where Vimalraj lived. According to Dakshinamurthy and others, a fair-complexioned young man in his late twenties stayed with Vimalraj for some time. Vimalraj himself was in his thirties, married to his maternal uncle's daughter, and had two children. He gave music lessons to children, many of whom were Sri Lankan Tamils. He attended church regularly. Dakshinamurthy and his neighbours said that the "CID police" came, questioned Vimalraj and took him to the police station. But the police did not arrest Soundranayagam from Vimalraj's home, they said. Dakshinamurthy explained: "After the police questioned Vimalraj, we asked him to vacate (the tenement), which he did."

A couple of weeks after Dr. Tiruchelvam's assassination, Colombo newspapers reported that Eric Soundranayagam had played an important role in the heinous crime but had escaped to India. A source from a militant group said: "He would not have gone back to Colombo on his own. Without the help of the local police, the Sri Lankan police could not have taken him away." The sources claimed that Sri Lankan and Tamil Nadu police personnel accompanied him to Colombo from Tiruchi and argued that he could have been "technically arrested after he got into the aircraft".

In the assessment of sources in the militant group, Soundranayagam could have been "a double agent but somebody felt that it was time he was compromised. He must have been trained even to intercept conversations by Indian officials." They claimed that Soundranayagam was now "cooperating with the police in Colombo and they have got various details" from him.

A top officer of the Tamil Nadu police said that the State police came to know that Soundranayagam had been taken into custody in Colombo only after *Virakesari*, a Colombo-based Tamil daily, reported it. The officer said, "His name has never come to our notice. This worries us a little – how he came here and went back. We have called for an explanation about how we missed him." ■

claim credit for the joint exercise because of possible political repercussions and potential embarrassment to the political leaders, it was alleged.

A noteworthy feature of the controversy was the conspicuous silence maintained by pro-LTTE political leaders in Tamil Nadu. A journal published in Canada stated that MDMK leader Vaiko had been requested by an organisation in Britain to condemn the alleged action taken in the case of Soundranayagam. Vaiko, however, declined, and according to the journal, explained that any statement by him would cause discomfiture to the Chief Minister.

Even as pro-LTTE media abroad began focussing on the Soundranayagam affair, the Sri Lankan press began presenting a different picture. Reports citing police sources said that Soundranayagam had neither been arrested in nor deported from India, and that he had returned of his own volition. Vigilant police officials had traced his whereabouts within a few hours and arrested him at Kerawalapitiya, a suburb of Colombo, they said. This claim, however, was a little unconvincing. Given the official reactions and public mood generated by the assassination, Soundranayagam would have to be foolish to have returned to Sri Lanka.

Once it was tacitly admitted that Soundranayagam was in police custody, a number of details about his alleged involvement with the LTTE began to surface in the media. It was said that Soundranayagam was assigned the task of

planning attacks against seven targets, of which he had accomplished only one – Neelan Tiruchelvam. The others included Douglas Devananda, leader of the Eelam People's Democratic Party, and Posts Minister Mangala Samaraweera.

The next stage was the appearance of news reports in the Sri Lankan and Indian media that Soundranayagam might have had an ulterior motive in visiting India. It was said that he had been taking a Hindi language course at the Indian High Commission in Colombo. He had also allegedly tried to gain employment as a reporter on an English-language daily in India. He was supposed to have approached newspapers in Chennai, Bangalore, Hyderabad and Thiruvananthapuram. He had also travelled to Tiruchi where both Prime Minister Atal Behari Vajpayee and Congress(I) president Sonia Gandhi had attended election rallies. His visits to Karnataka, Kerala and Andhra Pradesh were also viewed with suspicion because Sonia Gandhi had attended election meetings in these States. Given the *modus operandi* involved in Rajiv Gandhi's assassination in 1991 at Sriperumbudur during an election rally and the fact that Sivarajan, the leader of the assassination squad, successfully posed as a pressperson during a "dry run" at former Prime Minister V.P. Singh's election rally, Soundranayagam's Indian itinerary as well as his supposed attempts to become a reporter were regarded with suspicion. There have been speculative reports that a team of investigators from India may go to Colombo to interrogate him further.

Whatever be the truth about Soundranayagam's objectives, there is no denying that a strong case has been built up against him through media reports. But there have been many instances where such "trials by media" have occurred without any substantial follow-up action. Until and unless Soundranayagam is produced in an open court, the precise truth about his activities is unlikely to become public knowledge.

P. Nedumaran, the Tamil Nadu State convener of the Tamil National Movement and a loyal supporter of the LTTE, has issued a statement condemning the manner in which the whole incident occurred. He faulted the Central and Tamil Nadu governments for conniving with Sri Lanka on this issue. Nedumaran called upon both governments to clarify their position. It remains to be seen whether this will be done in the near future. ■

■ RAJIV GANDHI ASSASSINATION CASE

Questions of clemency

The four persons sentenced to death in the Rajiv Gandhi assassination case challenge in the Madras High Court the rejection of their clemency petitions by the Tamil Nadu Governor.

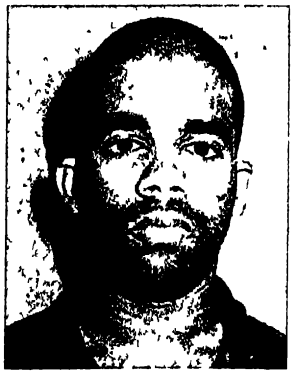
T.S. SUBRAMANIAN
in Chennai

CAN a Governor reject mercy petitions from persons, who are sentenced to death, without seeking the advice of the Council of Ministers? This question may dominate arguments in the Madras High Court on the admissibility of writ petitions from Nalini, Murugan, Santhan and Perarivalan, whose death sentences in the Rajiv Gandhi assassination case were re-confirmed by the Supreme Court last month. The petitions challenge the order of Tamil Nadu Governor Fathima Beevi rejecting their clemency petitions. The four had sought commutation of their death sentence to life imprisonment.

When the petitions came up for admission before Justice K. Govindarajan on November 2, the Judge said he found from the file that "there is no advice" from the Council of Ministers. Additional Advocate-General T.R. Rajagopalan replied that the Government had sent a note and that advice from the Council of Ministers was necessary only for giving pardon and not for rejecting clemency petitions. Senior advocate K. Chandru, appearing for the four condemned prisoners, argued that what was required was "aid and advice from the Council of Ministers" and not a note. The arguments on the petitions' admissibility will resume on November 10.

The petitioners said that the Tamil Nadu Governor had rejected their clemency petitions in "a hasty manner" without getting advice from the Council of Ministers.

By a two-one majority, the Supreme Court on October 8 dismissed the petitions of the four prisoners, seeking a review of its May 11, 1999 judgment under which all the four were sentenced to death for their participation in the conspiracy to assassinate former Prime Minister Rajiv Gandhi (*Frontline*, November 5, 1999). The three Judges were Justice K.T. Thomas, Justice D.P. Wadhwa and Justice Syed Shah Mohammed Quadri. The four accused were sentenced to death under Section 120-B (conspiracy) read with Section 302 (murder) of the Indian Penal Code. Justice Thomas, who gave a dissenting judgment, said Nalini's review petition "should be allowed and her sentence should be altered to imprisonment for life". (He had given a similar dissenting judgment with regard to Nalini on May 11.) But Justices Thomas, Wadhwa and Quadri were unanimous in their opinion that it was the Liberation Tigers of Tamil Eelam (LTTE) that murdered Rajiv Gandhi. (Many of the accused, including Murugan and Santhan, belong to the LTTE.)



RAJIV GANDHI was killed by an LTTE belt-bomb assassin, Dhanu, at Sriperumbudur, about 50 km from Chennai, on May 21, 1991. On January 28, 1998, Designated Judge V. Navaneetham sentenced to death all the 26 who faced trial. All of them appealed to the Supreme Court, which, on May 11, confirmed the death sentences awarded to Nalini, Murugan, Santhan and Perarivalan. The death sentences given to Robert Payas, Jayakumar and Ravichandran were "altered" to life imprisonment. Of the remaining 19 persons, 18 were released because they had served out their terms for the offences they committed. S. Shanmugavadivelu was acquitted.

After the Supreme Court re-confirmed their death sentences on October 8, Nalini, Murugan, Santhan and Perarivalan sent separate clemency petitions to

Governor Fathima Beevi on October 17. They said that Santhan, Murugan and Perarivalan did not go to the place where the former Prime Minister was killed. Although Nalini was present, what she was aware of was only that Dhanu carried a bulky object around her waist. The clemency petitions added that Nalini had had a traumatic childhood. Her father did not support the family. (Her mother Padma and brother Bhagyanathan were among the accused who were released because they had served out their sentences.) Murugan stayed with them as a guest. Nalini and Murugan got married subsequently, and a daughter was born to her in prison. According to Nalini's petition, if she were to die, her daughter would be orphaned.

Nalini.

Murugan.

Santhan.

Perarivalan.

The petitions said that the four had undergone solitary imprisonment for eight years. "This alone is a mitigating factor for commuting their sentence to life," the petitions said. They pleaded with the Governor for an oral hearing through their representatives.

The clemency petitions quoted from the judgment of the Constitution Bench of the Supreme Court in *Kehar Singh v Union of India* (1989) that "the power under Art. 72 entitles the President to examine the record of evidence of the criminal case and to determine for himself whether the case is one deserving the grant of the relief falling within that power." The four petitioners said that since the power to grant pardon or commute the death sentences was vested in the Governor under Article 161 of the Constitution, which is similar to Article 72, "the above observation could be taken as dealing with Your Excellency's power also."

The Governor rejected the petitions on October 27. The four filed writ petitions in the High Court challenging this. The petitions said that the Governor, without getting the advice from the Council of Ministers, had rejected their petitions in "a hasty manner", while similar petitions pertaining to other cases have been pending with the Governor for more than a year. This was "illegal, arbitrary and violative of the Constitution", they said.

They added that Article 161 empowered the Governor to grant pardons, reprieves, respites or remissions of punishment, or to suspend, remit or commute the sentence of any person convicted of any offence against any law relating to a matter to which the executive power of the state extended. There was nothing to debar the Governor from reconsidering the relevant circumstances, including the worldwide opinion against capital punishment, irrespective of the findings given by courts of law, the petitions contended.

POLITICAL parties in Tamil Nadu, depending on their position *vis-a-vis* the LTTE, have demanded that either the death sentences be commuted or they be carried out. The Pattali Makkal Katchi (PMK) and the Samata Party, whose leaders Dr. S. Ramadoss and Defence Minister George Fernandes respectively espouse the LTTE cause, wanted the death sentences to be reduced to life imprisonment. Ramadoss wrote to Rajiv Gandhi's widow and Congress(I) president Sonia Gandhi asking her to request the President to commute, on humanitarian grounds, the death sentences on the four persons to life imprisonment. (The four persons have not yet appealed to the President. They are awaiting the High Court's verdict.)

Samata Party general secretary Jaya Jaitely said that as a matter of policy her party had consistently opposed capital punishment. "Pending a national policy to abolish capital punishment in the new millennium year of 2000, the Government should commute all cases of capital punishment to life imprisonment," she said.

Surprisingly, Marumalarchi Dravida Munnetra Kazhagam (MDMK) general secretary Vaiko declined to comment on the issue although his party backs the LTTE's struggle to carve out an independent Eelam out of Sri Lanka.

Chief Minister M. Karunanidhi, who is also president of the ruling Dravida Munnetra Kazhagam, reacted cautiously. He said: "Our general viewpoint about death sentence – this is not (only) about Rajiv Gandhi's assassination – is that if prisoners get life imprisonment instead of the death penalty, there is a chance for them to repent. I am not saying this about this case. I have expressed this opinion long ago."

The All India Anna Dravida Munnetra Kazhagam (AIADMK), the Congress(I), the Tamilaga Rajiv Congress (TRC) and the Bharatiya Janata Party were categorical in opposing the grant of clemency. AIADMK general secretary and former Chief Minister Jayalalitha said: "I do not think that any right-thinking person will say that the assassins of Rajiv Gandhi should be let off Capital punishment is a deterrent against horrendous crimes." Tamil Nadu Congress(I) Committee president, Tindivanam K. Ramamurthi objected to Karunanidhi's viewpoint that he generally favoured life imprisonment rather than the death penalty. "He talks like this because of the compulsions he faces," the TNCC president said.

TRC president Vazhappadi K. Ramamurthy said political parties should not interfere in the President's prerogative to dispose of the clemency petitions from the four persons. "Any intervention would amount to questioning the Supreme Court's judgment," he contended.

M. Venkaiah Naidu, BJP spokesperson, said Rajiv Gandhi's assassins should be "mercilessly punished for the heinous crime." ■

Judgment reserved

General Pervez Musharraf inducts an administrative team, but democracy itself is nowhere in sight.

AMIT BARUAH
in Islamabad

PAKISTAN has entered a make-or-break phase of its history. The people, for the moment, are solely interested in results and performance. Will General Pervez Musharraf and his team be able to deliver? Will the coup leader be able to recover looted national wealth, bring offenders to justice, restore a semblance of economic order, ensure law and order and put the country on course for "real" democracy?

The country has its ninth government in 11 years – four elected governments, four caretaker set-ups and now the military regime with a "civilian front". No civilian government has been allowed to complete its five-year tenure in office. It is hardly an enviable record.

Right now, the Army and the General are on trial. Sick and tired of the Nawaz Sharif and Benazir Bhutto duo that has dominated the political scene for almost a decade, the people are relieved to see the back of the ousted Prime Minister. They may not have much to say about the way the change was effected, but they do have lots to say about their expectations from the new regime.

Gen. Musharraf will find that he has no honeymoon period. The people expect him to show results immediately. The crackdown on loan defaulters and tax evaders, which is to begin from November 17, will be the first test for the Government. Will the Army be able to trap the big fish and make them cough up defaulted loans of over Rs.200 billion?

The fact is that "good words" have been heard before. A senior Pakistani journalist, veteran of many a martial law, told this correspondent: "We are good at formulation and planning. But there has been no implementation in the last 52 years. Gen. Musharraf will have to demonstrate that he is different."

You find the same mood on the streets of Pakistan. Yes, it is good to see that Nawaz Sharif is gone, but we have to wait and see what the new regime does. The people's judgment is reserved.

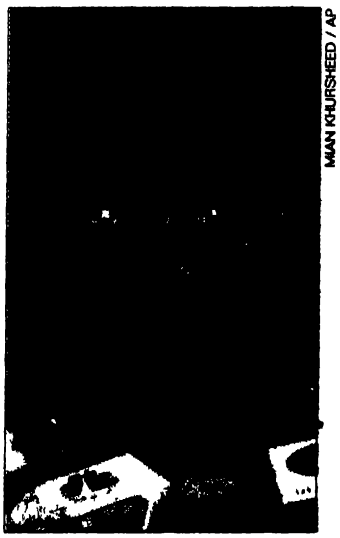
So far, the General has appointed six members to the National Security Council (NSC) and announced a 10-member Cabinet, which is likely to be expanded to a 12-member one. The appointment of Syed Sharifuddin Pirzada, who was a legal "wizard" to the late Gen. Zia-ul-Haq, and that of Mohammad Yaqub, State Bank Governor, to the NSC, has been greeted with considerable scepticism.

Pirzada has been the handmaiden of martial law regimes past; he has provided the legal "cover" to the illegal acts of martial law governments. Yaqub has been around for several years; he has not been able to do much for the country's economy. In fact, during his tenure the economy has continued its downhill slide.

In the Cabinet, barring four members, the others are relatively unknown faces, something that is welcome in itself in a country like Pakistan. The Foreign Minister, Abdul Sattar, is hawkish on India, though his views are well-argued from a Pakistani standpoint. Recent statements from the Pakistani Foreign Office have accused India of furthering its "hegemonic interests" – such phraseology was missing from the Pakistan-India discourse at least during the second tenure of the Sharif Government.

Finance Minister Shaukat Aziz is on loan from Citibank to Pakistan. Acceptable to the West and the donor agencies, Aziz's appointment indicates that there will be no departure from past policies; an element of greater implementation in the collection of taxes and continuity of policy will be welcomed by the West.

Lt. Gen. (retd) Moinuddin Haider, the Sindh Governor removed by Nawaz Sharif, is the Interior Minister. As Sindh Governor he showed himself to be a man of ideas, but was apparently thwarted at every level by the former Prime Minister, who finally sacked him.



The other appointment that has evoked interest is that of Omar Asghar Khan. His appointment as Minister for Rural Development is a welcome one. The son of Air Chief Marshal (retd) Asghar Khan, he runs a non-governmental organisation called Sungi. Omar Asghar Khan has been at the receiving end of the religious Right. Qazi Hussain Ahmad, chief of the Jamaat-e-Islami, has accused the General of inducting members of the "NGO mafia" into his Cabinet.

Gen. Musharraf, it seems, will finally have three members from each of the four Pakistani provinces of Sindh, Baluchistan, Punjab and the North-West Frontier Province. Such a policy is a deliberate one, aimed at giving the "smaller provinces" the feeling that they are equal partners in the Pakistani Federation. Of course, such equality cannot be ensured by parity of numbers alone, but this move is seen as a step in the right direction.

The General has appointed two women – Atiya Inayatullah to the NSC and Zubeida Jalal to the Cabinet as Education Minister. This follows his statements that women need to be given greater representation at all levels.

In the area of the economy, however, there seems to be little attempt at any fresh thinking. Pakistan's "one-tranche" economy is heavily dependent on the International Monetary Fund (IMF) and other agencies. Their conditionalities stress on one simple issue – greater revenue generation – which in the Pakistani context means recurring increases in direct taxes.

S. Akbar Zaidi, a leading economic analyst, argued in a recent article: "Since it is more than probable that the same policies devised by

MIAN KHURSHEED / AP

Gen. Pervez Musharraf.

the IMF and World Bank which were responsible for these downward (economic trends since 1988) are likely to continue into the future, we have little reason to celebrate. Moreover, under the four democratic regimes since 1988, the policies of the IMF and the World Bank were, at times, half-heartedly followed through because of their obvious negative consequences, and had to be slowed down or even abandoned due to public pressure and protest. What is worse and more worrisome then is that with little need to be popular as they do not have to face an election, the military government can go all out to enforce these policies. The eventual consequences are likely to be far different from the expectations of the military or its supporters."

Zaidi argued that since Pakistan began pursuing the IMF-Bank-directed policies since 1988, its growth rate has dropped in comparison to the trend level of previous years. In the last 11 years, in only one year was GDP growth more than the six per cent demonstrated since 1977.

IN a sense, Pakistan has gotten used to change of governments and political turmoil. Zia-ul-Haq had the longest tenure of 11 years; but in the 1977-85 period he ruled as the Chief Martial Law Administrator. During the 1985-88 period, he had an uneasy relationship with Prime Minister Mohammad Khan Junejo, who became the first victim of the President's new powers under Article 58 (2)(b).

Writing in *Dawn*, columnist Ayaz Amir draws attention to the distorted democracy that has existed in Pakistan:

"Military interventions in Pakistan have always followed a genetic code. In the beginning they exude a sense of vitality and vigour. Public expectations are high and there is talk of reform in the air. Politicians as a class are reviled and stories of their ineptitude and corruption are laid bare. Then as time passes military rule mutates into a hybrid democracy with a section of the political class becoming willing tools of the new dispensation. This was the pattern both under Ayub and Zia. Yahya who came in between had not the time for it because he was busy presiding over the break-up of Pakistan.

The newly inducted Cabinet Ministers, who were administered the oath of office by President Rafiq Tarar and Gen. Musharraf, at the presidential residence on November 6.

"Zulfiqar Ali Bhutto and then, a political generation later, Benazir Bhutto and Nawaz Sharif, were products of the mutant and distorted democracy growing out of military rule. Bhutto senior was a product of the Ayub regime; Nawaz Sharif and his Muslim League the most outstanding political products of the Zia regime. In blaming these knights for their failures, and there is no doubt that their failures have been conspicuous and enormous, the Army cannot absolve itself of a large share of the blame.

It is widely felt that Gen. Musharraf, if he has to carry credibility with the mass of the Pakistani people, must think and act differently. He has to distance himself from the record of the Chief Martial Law Administrators of the past; not just in form but in content. And that, clearly, is a tall order. Also, there is a growing demand that the promised process of accountability must also cover the Army itself. The Jamaat-e-Islami chief, Qazi Hussain Ahmad, once described the Army's "corps commanders" as "crore commanders" – a description that could hardly have endeared him to the Army

In reply to a question from the BBC, the General conceded that there could be corruption in the Army. Earlier, at his November 1 press conference, the Chief Executive said that Army personnel would also be covered under the ambit of the newly-formed National Accountability Bureau (NAB) headed by Lt. Gen. Syed Amjad.

Musharraf also referred to the possibility of holding a referendum in a "bid" to legitimise his rule and the setting up of a Constitution Commission to reform the statute. The General also said that the Army would not intervene directly in the work of civil institutions, but would be engaged in an elaborate "monitoring system" in order to ensure the implementation of government policy. The use of the "intelligence system" to vet civilians being appointed in the civilian administration is an indicator of the widespread use of the "eyes and ears department" in Pakistan and its institutional status.

At his first press conference, the General revealed that he was conscious of the criticism against the first batch of appointments. He promised to be more careful and declared that those who did not perform would be replaced.

MUSHARRAF, who met delegations from the Commonwealth and the European Union, has meanwhile refused to spell out any time-frame for the return of democracy With "due deference" to the wishes of the international community, he maintained that he would act in the national interests of Pakistan. Taking this logic forward, the Army chief said that he was not even thinking in terms of a time-frame for a return to "democracy". Earlier, he told the official APP news agency· "Firstly, I have seen whenever you give a time-frame, a countdown starts and everyone gets into a standstill. The government machinery doesn't work seriously because they know that the time is limited and on the other side they start whiling away the time."

The General added: "I'm a strong believer in honouring my words. I don't want to say for the sake of saying it. Whatever I say must be done. And, if it is not done, I would like to tell the nation why it is not being done. Because, I mean it. I'm saying it from (my) heart. So, if I give a time-frame and then go back on it, it doesn't fit into my way of thinking. I don't like to do that. Then, I have said there are so many issues to be addressed. Therefore, I would not like to give the time-frame. I have to complete that work first."

The General also said that the international reaction to his October 12 coup was milder than what he had expected. In fact, he was surprised by its mildness. Domestically, he was of the view that he had expected the response to his coup to be positive. "I was pretty sure that the conditions were so bad that the people are

Souring relations

AMIN BARUAH

THE days of lambasting "Indian hegemony" are back. The Lahore process stands undermined as the new Pakistani leadership reverts to a classic anti-India mode which has continued for much of the last 52 years.

A new process of engagement will have to be negotiated between India and Pakistan, signals coming from the military leadership suggest. Already, the General, in his remarks to the BBC's Urdu Service, has given short shrift to the Lahore process and the related agreements. And, that process of engagement is nowhere in sight.

Stressing that India's sole intent was to "sideline" the Kashmir issue and focus on the other issues in the "two plus six" Foreign Secretary-level talks, the General said India was wrong to believe that Pakistan could be browbeaten like other "smaller" nations. Denying that Pakistan posed any threat to India, Gen. Musharraf claimed that in terms of size the Indian Army was three times that of Pakistan, and Pakistan's population was one-ninth that of India. And New Delhi was getting set to test an Inter-Continental Ballistic Missile (ICBM). "What kind of threat can we pose to India? We are a small country," the General said.

Obviously, the General's initial announcement that he was unilaterally pulling back troops moved to the international border with India did not amount to much. The fact that there was no intention to extend the withdrawal to the Line of Control (LoC) or even to discuss the issue with India revealed the intentions behind the announcement.

On November 6, the Pakistani Foreign Office criticised the Government of India for getting the Kathmandu summit of the South Asian Association for Regional Cooperation (SAARC) postponed. Giving sufficient indication of the new terms of discourse with India, the Foreign Office accused India of scuttling the summit in "reckless pursuit of her compulsive hostility and her persistently negative attitude towards dialogue and peaceful resolution of disputes". Such language had been absent for some time from Foreign Office statements.

In his November 1 press conference, the General said Indian hostility would be met with hostility, peace with peace and threats with threats. "I will ensure the honour and dignity of this country. Nobody threatens us without getting a threatening response...." the khaki-uniformed Army chief stated in response to questions. He made it clear that Pakistan wanted a Kashmir-first solution, or at least a simultaneous resolution of the Kashmir issue along with other issues. "We would like to resolve all our differences, and when I say all our differences I mean the core issue of Kashmir first of all – or simultaneously at least."

"But if there is any design to address issues other than Kashmir and sideline the Kashmir issue, I am not a part of it. The Kashmir issue has to be addressed and with that all other issues can be addressed. If this is the attitude we see from across the border, I can assure that I will be going far ahead of them (the Indians) in this area," the General added.

When he was asked about a recent article written by former Indian Prime Minister I.K. Gujral about his relationship with Sharif, the General found it to be an interesting issue. He said there was a "very close relationship" across the border. Whether it was a business relationship, setting up factories or investing money "there" (in India) – all this was being investigated as part of a general probe into charges against the former Prime Minister. There was also the issue of "meeting people secretly" and considering "them" closer than "our own people".

Evidently, the General has not been able to rid himself of the "commando" image that he has *vis-a-vis* Kargil and India. In initial rounds of plainspeaking, Musharraf had not indicated his views on the dialogue process with India. Now, by undermining the Lahore process, the General has confirmed that the Pakistan Army is the stumbling block in the normalisation of relations with India. Nawaz Sharif, who approved the Kargil operation, had a flawed India policy; but that policy was low on hawkishness.

India will now find a more hawkish policy in Islamabad towards it – one that will make mutual engagement difficult. Clearly, Sharif's muddled approach to India, led from the front by Gen. Musharraf, has ruined the prospects of any rapprochement. ■

going to accept this change," he said. Interestingly, the General chose to characterise his action as a counter-coup. "(The) coup was by the previous government," the Army chief said in a reference to his "sacking" by Nawaz Sharif.

The agenda set by the General and his outright refusal to set any time-frame to his rule implies that he is going to be around for some time. Musharraf told CNN television that he was certainly looking at his tenure in terms of months. Since it cannot be in weeks or days, then clearly we are looking at a period running to years.

THE first stirrings of protest have come from the religious right. Qazi Hussain Ahmad, who was barred from entering the NWFP after he made a speech critical of the General, later had the ban revoked. In his first post-coup speech on November 5, the Qazi criticised the selection of members to the NSC and the Cabinet, describing them as members of the "NGO mafia". Those selected are broadly Western-educated, with no perceptible leanings towards hardline Islam. The Qazi said in Peshawar that the members of the Cabinet and the NSC did not have the support of the masses. "These people will tax the masses, line their pockets and leave this country," he said. Decrying the ban on the use of loudspeakers in mosques in the NWFP, he said this was outrageous. "There is no ban on dance parties, full of obscenities, in cantonments," he said.

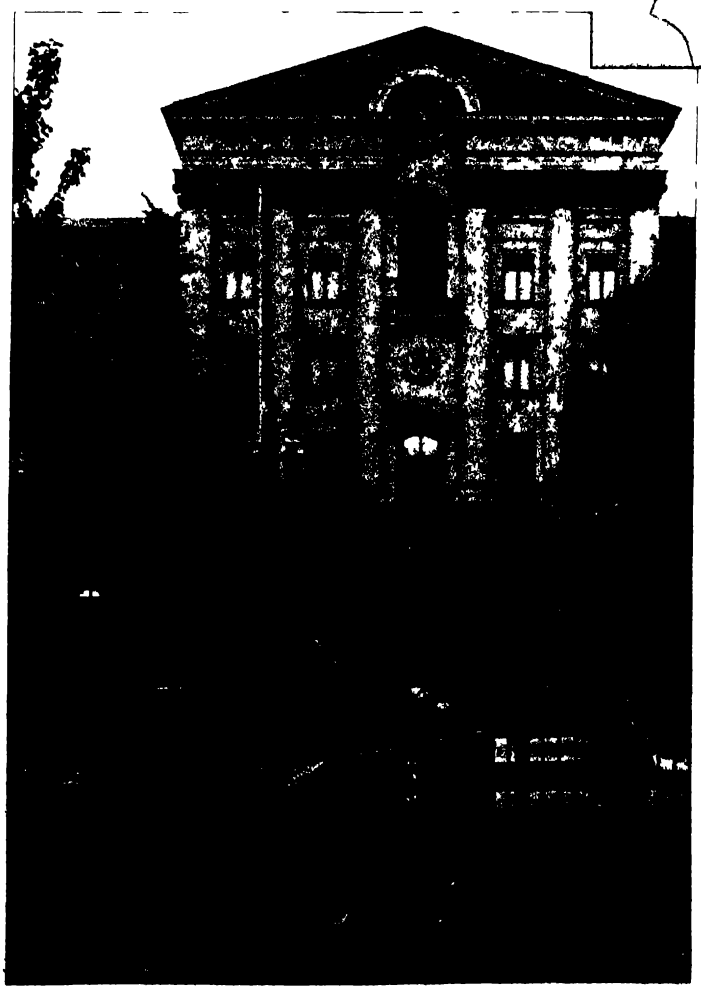
It would appear that the religious Right is the first to oppose the General. The reasons are not far to seek – Musharraf has, so far, shown no inclination to appease the clerics though he has made the mandatory "*umra*" visit to Mecca. The Jamaat and other members of the family of the religious Right are aware that the General is in a position to hit at their roots if he so chooses.

A Government is in place, the Ministers have taken their oath of office, deriving their power from the Chief of the Army Staff. The waiting period is over. The General must now deliver on his promises to a restless Pakistan. ■

A crisis in Armenia

The serious threats to stability in the Caucasus region have come to the fore with the killing of the Prime Minister and several top government functionaries of Armenia inside the country's Parliament building.

JOHN CHERIAN

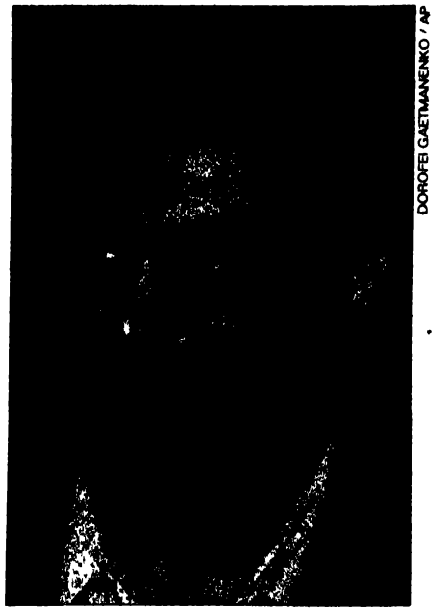


THE brutal killings of the Prime Minister and several top government functionaries of Armenia in the capital Yerevan on October 27 could further destabilise the situation in the Caucasus region.

Armenians and the international community were shocked by the manner in which the killings were carried out. Five gunmen burst into the Parliament building when the House was in session and shot in cold blood Prime Minister Vazgen Sarkissian, Speaker Karen Demarchian, Deputy Speakers Yuri Bakshian and Ruben Miroaian, Energy Minister Leonard Petrasian, senior civil servant Michail Kotanian and two legislators. Seven parliamentarians were injured, one of them critically. The incident was captured on national television, which was broadcasting live the parliamentary proceedings.

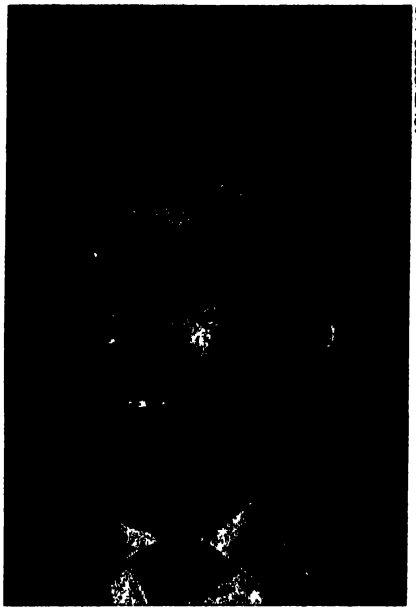
After accomplishing their major objective of eliminating the top political leadership, the assassins barricaded themselves in the Parliament building and held many lawmakers hostage. Led by former journalist Nairiu Unanian, they demanded that they be allowed to declare on national television that the government had been overthrown. The hostages were released after more than 48 hours of tortuous negotiations, a task in which President Robert Kocharian was personally involved. The President publicly assured the gunmen that force would not be used against them and that they would not be physically harmed after their arrest. He also conceded the assassins' demand for time on national television.

In his televised statement, Unanian accused the government of allowing Armenia to disintegrate and charged the country's elite with corruption. Unanian was a member of the extreme right-wing and ultranationalist Dashnak Party. The five assassins, three of whom belonged to the Unanian family, are now in jail awaiting trial.



MISHA JAPARIDZE AP

Armenian soldiers stand guard at the gate of the Parliament building in Yerevan.



POLITICAL terrorism is not a new phenomenon in states that emerged out of the former Soviet Union. Eduard Shevardnadze, the President of the neighbouring republic of Georgia, has escaped at least two assassination attempts, the last of which was made early this year. The President of Uzbekistan escaped death in a car bomb explosion this year.

Politics in Armenia has been volatile since its independence after the collapse of the Soviet Union. The struggle between Armenia and its immediate neighbour Azerbaijan over the disputed enclave of Nagorno-Karabakh has proved costly for both countries. Although Armenia gained militarily and is in full control of the enclave, it has had to pay a high price for this. It was reported in recent months that the leaders of Armenia and

Speaker Karen Demarchian.

Azerbaijan had come close to a settlement. There is speculation that the assassinations of the Prime Minister and the equally influential Speaker were connected with the Nagorno-Karabakh problem.

Nagorno-Karabakh declared independence in 1988 and separatists, helped by Armenian troops, threw out from the territory the Azeri army along with the Azeri population. A truce was signed in 1994 but sporadic fighting continued. The Clinton administration is interested in an early settlement of the problem, for geopolitical considerations of its own. Just hours before he was killed, the Prime Minister had had a meeting with U.S. Deputy Secretary of State Strobe Talbott. Talbott reportedly discussed with Sarkissian the U.S.-supported plan to designate Nagorno-Karabakh an autonomous republic attached to Azerbaijan. The U.S. plan envisages a separate army and currency for the Armenian-dominated enclave, which in many respects would enjoy the kind of independence Kosovo enjoys today.

Sarkissian was a nationalist who made a name as the commander of the forces that fought the Azeri army. It was speculated that the President and the Prime Minister were all set to sign a crucial deal. There was also a rumour that Armenia was offered participation in a lucrative deal involving a pipeline that would transoil from the Caspian Sea to key. Armenia, whose economy has been in free fall for some time, is cash-strapped.

About a million Azeris have become refugees because of the war over Nagorno-Karabakh. Armenia has occupied more than 10 per cent of Azerbaijan's territory. The military defeat precipitated violent political turmoil in Azerbaijan and led to the re-installation of Gedar Aliyev as President. Aliyev, who was a Polit Bureau member of the Communist Party of the Soviet Union under President Leonid Brezhnev, is today the staunchest ally of the U.S. in the region. One of Aliyev's senior-most advisers recently issued an appeal to the U.S., the North Atlantic Treaty Organisation and Turkey to station troops in his country. Armenia, on the other hand, is one of the closest allies of Russia in the region and Azerbaijan's growing tilt to the West had alarmed the Russian leadership.

At the request of the Armenian government, the Russians have shipped S-300 surface-to-air missile systems and a squadron of advanced MiG-29 fighters to Armenia. Jewish-American lobbyists in Washington, meanwhile, have been trying to get the U.S. Congress to reject Article 907, which prohibits U.S. military aid to Azerbaijan, in exchange for Azerbaijan entering into a quasi- alliance with Israel and Turkey against Iran. This is done in order to enable the shipment of vast quantities of the Caspian oil into the world market while at the same time keeping important players such as Russia and Iran out of the "great game".

Russia is naturally concerned at the alarming events in Armenia and fears that the republic's domestic and foreign policies could change in the wake of the assassinations. Many Russians view Armenia as the only strategic partner of their country in the region at this juncture. Russian-Armenian military cooperation started in 1992, when the Presidents of both countries signed a treaty allowing Russian troops to remain on Armenian soil. In 1995, a 25-year treaty was signed, allow-

AP

Police officers escort parliamentarians who were held hostage and then released by ultranationalist terrorists.

ing Russian troops to retain the use of their bases in Armenia. The Russian military units stationed in Armenia are supposed to defend the southern air space of the Commonwealth of Independent States (CIS). The 2,500 Russian troops deployed in Armenia have enough weaponry and equipment to deploy several mechanised-infantry divisions. It is feared that if Russia loses its foothold in Armenia, it will lose control over the entire Caucasian mountain range.

The Russian government and media have also been interpreting the events in Yerevan as yet another illustration of the dangerous proportions that terrorism has assumed in the states that were part of the Soviet Union. The terrorists who occupied the Armenian Parliament building kept the hostages at gunpoint for two days. Russian officials have reacted positively to the demand of the Armenian Defence Ministry that the Prosecutor-General of the Republic be dismissed along with the Heads of the Ministry of Interior and the Ministry of National Security. In a statement, the Armenian Defence Ministry called the assassinations "a treacherous crime, planned and prepared beforehand, that was aimed at Armenia's statehood and against the future of the Armenian nation."

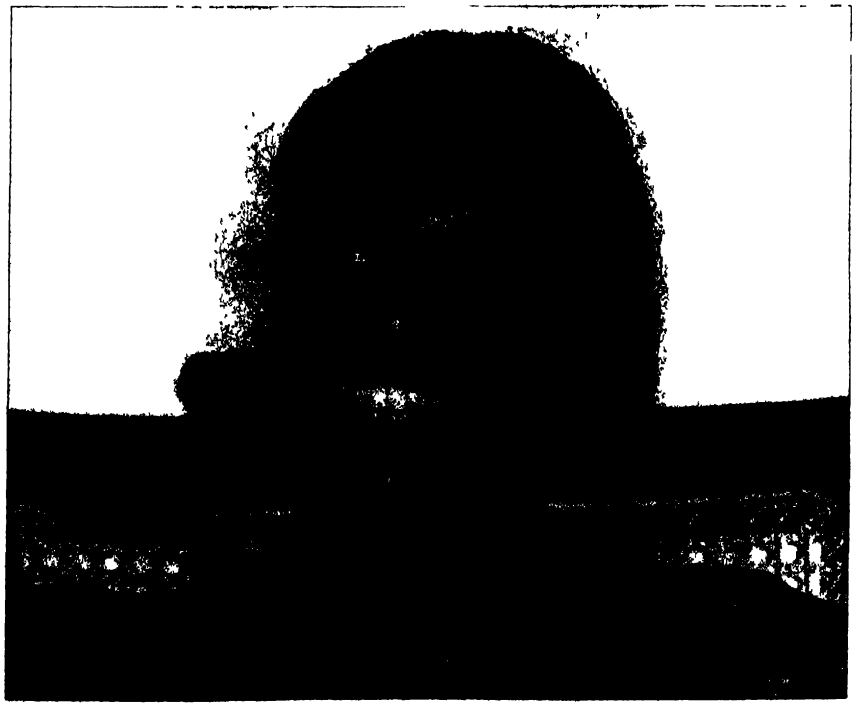
Moscow has, however, given an assurance that it will continue to support the ongoing peace talks between Armenia and Azerbaijan. After talks with Talbott, who visited Moscow in the last week of October, Russian Foreign Minister Igor Ivanov said that his country's support for the talks, which are co-sponsored by Russia, France and the U.S. would not be affected. "We hope that the recent tragic events will not make the process of solving the Nagorno-Karabakh problem more difficult," he said.

Talbott was present at the funerals of the Armenian leaders. He was on a tour of the countries in the region seeking to expedite a settlement of the Nagorno-Karabakh issue. He admitted in Moscow that the killings would "cast a pall" over the peace negotiations. More than 35,000 people were killed in the fighting over Nagorno-Karabakh before a tenuous ceasefire took hold in 1994.

Meanwhile, in Yerevan, President Kocharian has assumed control over the government until a new Prime Minister is appointed. The Interior Minister has handed over his resignation for the security lapse that allowed the assassins to enter the Parliament building with semi-automatic weapons. ■

Electoral imponderables

Chandrika Kumaratunga opts for early presidential elections; a tough battle awaits her.



V.S. SAMBANDAN
in Colombo

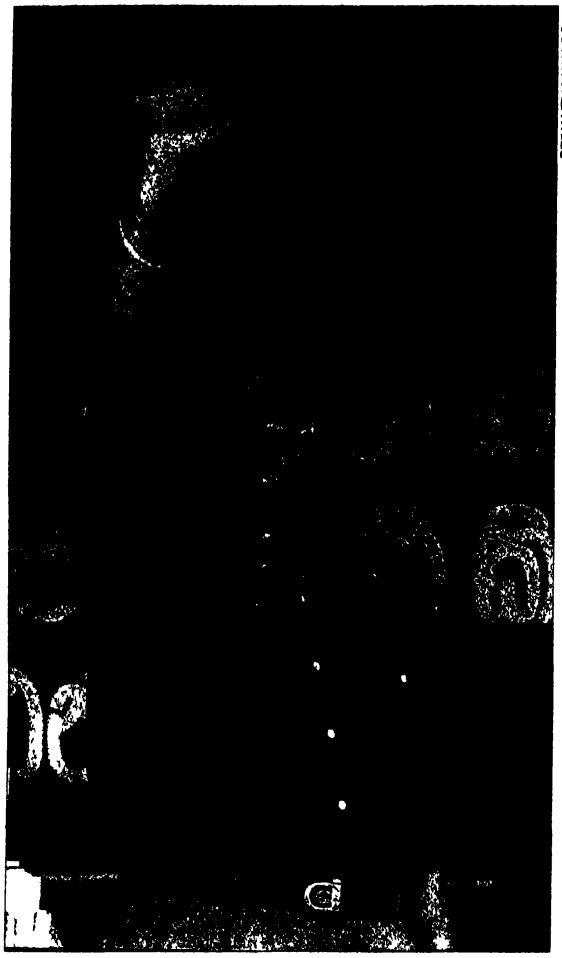
CONFRONTED with a political impasse in her efforts to resolve Sri Lanka's decades-old separatist conflict, President Chandrika Kumaratunga has called an early election to the presidency. An estimated 11 million Sri Lankans will now vote on December 21. Kumaratunga, who was elected to a six-year term in 1994, opted for early polls in order to obtain a fresh mandate to resolve the ethnic conflict. Within hours of addressing the nation, she set the agenda, saying that she would resolve the conflict within months of her re-election. The President also dwelt at length on the efforts made by her administration to work out a lasting solution.

With nominations yet to close, it appears that the main challenge to Chandrika Kumaratunga will come from Opposition leader Ranil Wickremasinghe.

As in the 1994 elections, the presidential contenders have given top priority to finding a solution to the strife in the North and the East. But unlike at that time when Chandrika Kumaratunga won by a handsome margin – she won 62.2 per cent of the vote – a close contest is expected this time.

In 1994, a big chunk of the Tamil vote in the North and the East went in Chandrika's favour; this time, however, there is no such certainty. It was a vote for change then; the electorate hoped that by rejecting the United National Party (UNP) and by choosing Kumaratunga, the People's Alliance candidate, the Tamil question could be resolved. This expectation had its basis in the fact that Chandrika Kumaratunga was groomed in liberal traditions.

SRIYANTHA WALPOLA



President Chandrika Kumaratunga.

But, as it turned out, the island's Tamils are a disappointed lot. Lack of cooperation from the UNP on the one hand and a no-win situation facing the military in its offensive to recapture areas held by the Liberation Tigers of Tamil Eelam (LTTE) on the other have constrained the President's efforts to break the political deadlock.

In 1994, while her vote-share at the national level was 62.28 per cent, Chandrika Kumaratunga polled 85.14 per cent of the votes in the four Tamil-majority districts of Jaffna, Vanni, Batticaloa and Trincomalee, a clear indication that the Tamils set great score by her leadership.

In Batticaloa, where 64.32 per cent of the 2.6 lakh voters exercised their franchise, Chandrika Kumaratunga got the second highest percentage of votes, 87.30, next only to that she won in Jaffna, which was 96.35. The figure for Jaffna must be seen in the backdrop of the fact that only 17,716 of the 5.9 lakh voters in the district exercised their franchise. Parts of the district were under the control of the LTTE.

This groundswell of Tamil support, however, appears to have vaporised, going by reports from the North and the East (independent access to areas held by the LTTE is hampered by restrictions on the movement of journalists, for security reasons). "We asked the people to vote for Chandrika Kumaratunga last time. This time, we dare not do so," said a Tamil political leader from the East. A leader of a former militant group said emphatically that his party would not be in a position to seek the people's vote for the P.A. candidate as she did not deliver on her earlier promise to end the conflict.

SRIYANTHA WALPOLA

UNP leader Ranil Wickremasinghe.

THE announcement of elections did not take the island by surprise. It received mixed reactions from the political parties. The UNP said it was ready to face the electorate. Wickremasinghe's initial reaction was: "I am ready, my party is ready and we will win."

Days later, kicking off his party's campaign, he said he would accord the "highest priority" to resolving the ethnic conflict. He also laid emphasis on "economic revival" and changes in the education system with the focus on English education and computer literacy.

Having played truant on supporting the peace proposals for almost five years, the UNP is gearing up for the elections on the promise that it will "end the war", commence "de-escalation" and "talk to the LTTE". However, there has been no elaboration on its strategy; the possibility of the Tamils supporting Wickremasinghe will become clear only with the unfolding of the party's position on the peace proposals.

If he continues to harp on "talking to the LTTE", there is the likelihood of the Tamils considering supporting his efforts. But, given past experience, this seems unlikely as Tamil political leaders want to emphasise that no 'Sinhala' government would be able to resolve the crisis.

Moreover, Tamil voters who are against Chandrika Kumaratunga's re-election are equally forthright that they would not like to back the UNP.

This leaves the Tamil vote wide open at this stage. Former militant parties are considering the possibility of fielding a common Tamil candidate in order to garner this "protest vote".

Their argument is that such a measure would make the political statement – that the "Sinhalese leadership" does not enjoy the confidence of the Tamil electorate in resolving the conflict.

However, the most important factor that will determine the Tamil vote, according to political observers, could be the 'signals' given by the LTTE. Some feel that one extreme choice open to the Tigers is to field a candidate under the People's Front of Liberation Tigers (PFLT), a registered political party. Even otherwise, any indirect signal from the LTTE is bound to influence the Tamil vote.

The demise of the Ceylon Worker's Congress (CWC) leader S. Thondaman has introduced an element of uncertainty into the vote of the Tamil plantation workers, who are of Indian origin. They are estimated to comprise 5.5 per cent of the island's electorate. Under Thondaman's leadership they constituted almost a bloc vote – although there were internal problems that troubled the CWC. However, in a resolution adopted on the day Thondaman died, the party announced its support to Chandrika Kumaratunga. This decision, CWC leaders say, would be treated as his "last wish".

The UNP, however, feels that it can draw on the plantation workers' vote in the absence of Thondaman. It was during the UNP rule that plantation workers derived considerable benefits, including citizenship for a large number of them whose fate had remained undecided.

The nominee of the Left-radical Janatha Vimukthi Peramuna (JVP) and a rebel Left candidate, Vasudeva Nanayakkara, are also contesting the elections. While the JVP will field a relative lightweight, politburo member Nandana Gunatilake, on the one-point agenda of "abolition of the executive presidency," Nanayakkara's candidature is more a reflection of the internal differences in the Lanka Sama Samaja Party (LSSP). These two candidates could at best wean away the votes of the people who are disenchanted with the two main parties.

The electoral battle, which may be a tough one, will essentially be between Chandrika Kumaratunga and Wickremasinghe. ■

In the cause of plantation labour

Saumiyamoorthy Thondaman, 1913-1999.

D.B.S. JEYARAJ

SAUMIYAMOORTHY THONDAMAN, who passed away on October 30, was the undisputed leader of Sri Lanka's predominantly Indian Tamil plantation proletariat. At 86, he was both the oldest and the seniormost members of the Sri Lankan Cabinet: he had served continuously for 21 years from 1978, under Presidents J.R. Jayewardene, Ranasinghe Premadasa, D.B. Wijetunge and Chandrika Kumaratunga. Thondaman was the leader of Sri Lanka's Tamils of recent Indian origin, known as "Indian Tamils" and consisting mainly of tea and rubber plantation workers.

Thondaman had gone to Nuwara Eliya, in the central highlands, to preside over a meeting of the India Vamsavali Makkal Perani (Front of People of Indian Descent), an umbrella organisation of which his Ceylon Worker's Congress (CWC) was the pivotal force. Having thrown in his party's lot with President Kumaratunga in the coming presidential election, Thondaman was working to win over the support of the other 19 constituents of the Perani to his way of thinking. Having taken ill on the morning of October 30, he was rushed to a hospital in Nuwara Eliya and from there flown to the Sri Jayewardenepura Hospital in Colombo. The cause of death was myocardial infarction.

Born in 1913, the political veteran celebrated his 86th birthday on August 30. As president of Sri Lanka's largest and one of the oldest trade unions, the CWC, Thondaman played a prominent role in the country's post-independence politics. His political life was intertwined with the vicissitudes of the Indian Tamil people of Sri Lanka, who form the most deprived section of Sri Lankan society. His goal was to emancipate these people from the wretched plight they were in owing to historical injustice. Although he could not fully realise these aspirations, it cannot be denied that the pragmatic leadership of Thondaman helped the people he represented to better their circumstances from the dire position they were in at the dawn of Sri Lanka's independence.

Thondaman's father Karuppiah Thondaman was connected to the royal family of Pudukkottai. This branch of the family, however, underwent a decline in fortunes, and it was on the verge of impoverishment when Karuppiah migrated to Ceylon, as Sri Lanka was called by the British, to become a "Kankani", or supervisor, of tea estate workers. Through hard work and shrewd business acumen he became the owner of a prosperous tea plantation, Wavendon estate, in Ramboda in the Nuwara Eliya district.

Young Thondaman, born in Munappudooi, came over at the age of 11. He went to secondary school at St. Andrews, Gampola. He then took to planting as estate management was then known. In his late teens and early twenties Thondaman led the life of a brown sahib, as the son and heir of a prosperous plantation owner.

SRIYANTHA WALPOLA

There was, however, an idealist streak in the son, who was not content to lead a luxurious life. Instead, he chose to espouse the cause of plantation workers, who were exploited ruthlessly. The bulk of these workers were Tamil people who were brought as indentured labourers from the then Madras Presidency. Thondaman and other like-minded idealists started organising plantation workers on the lines of trade union movements.

The Indian freedom struggle led by Mahatma Gandhi had a demonstration effect. The Indian community, guided by Jawaharlal Nehru, declared itself formally, in his presence and according to his advice, as the Ceylon Indian Congress (CIC) on July 25, 1939. The War years saw trade unionism taking firm roots in the estates. Thondaman at times spent his own money to finance strikes. The CIC developed into a formidable organisation at the time of independence, with Thondaman as a leader.

In the elections to the first Parliament in 1947, eight persons representing plantation Tamil interests were returned. Of these, six were from the CIC. Thondaman himself won from Nuwara Eliya with a majority of 6,135 votes. In addition to this, Tamil workers helped influence results in a further 12 constituencies. Parliament at that time had 95 elected and six appointed members. Interestingly, Thondaman was the only member of the first Parliament to be a member of the current Parliament.

The United National Party (UNP) government under D.S. Senanayake felt threatened on class and ethnic lines by this "alien presence". It introduced legislation in 1948 and 1949 to deprive the Indian Tamil community of citi-

zenship and franchise. Thondaman and other Indian Tamil leaders, inspired by the Gandhian ethos, chose to combat these blatantly discriminatory measures by resorting to mass satyagraha. After 18 months the struggle was called off.

Accepting the inevitable, the plantation workers began applying, under the new regulations, for citizenship afresh. The stringent requirements imposed and the strict application of those requirements during processing saw most workers being denied citizenship and, by extension, voting rights. Of the 1,071,000 Indian Tamil people who were residents of the Island at the time of independence, only 1,32,000 became eligible for citizenship by 1962.

In the meantime, lakhs of Indians returned to India voluntarily. The 1958 communal riots accelerated this process. The CIC transformed itself into the CWC in 1950. With the deprival of voting rights it became more of a trade union with a political wing than a political party with a trade union. No member of the CWC was elected to Parliament in the 1950s.

In July 1960, Thondaman became an appointed Member of Parliament under Sirima Bandaranaike's government. He represented the hill country Tamil category known as "stateless" people, that is, Tamils who were citizens of neither Ceylon nor India. The worst, however, was yet to come.

In October 1964, Prime Ministers Lal Bahadur Shastri and Bandaranaike signed an accord which arbitrarily determined the future of these so-called stateless persons. The Sirimavo-Shastri Pact, as it was popularly known, divided the stateless people on a ratio of seven to four between India and Sri Lanka respectively. Out of the 9,75,000 stateless persons, 5,25,000 were to be repatriated to India while 300,000 were to be granted Sri Lankan citizenship. The fate of another 150,000 people was kept in abeyance. In 1974, Prime Ministers Bandaranaike and Indira Gandhi signed another accord, which divided these people equally – 75,000 each between the two countries.

The tragic dimension to this exercise was that the CWC, which represented the stateless persons, was not consulted. Angered over these developments, Thondaman joined with dissident Sinhala MPs and brought about the downfall of the Bandaranaike government in December 1964; Thondaman abstained during a crucial vote, and the government fell by a one-vote margin. The incident also brought under the spotlight the political animal that was Thondaman. Instead of striking out against the government in opposition to the Sirimavo-Shastri Pact and inviting political isolation, Thondaman chose to bide his time and team up with other Sinhala MPs on the question of press freedom at the opportune moment and help deliver the *coup de grace*.

In 1965, Thondaman became an appointed Member of Parliament at the time of the UNP government of Dudley Senanayake. He used the opportunity to delay the repatriation while encouraging the process of re-enfranchisement. Thondaman reportedly told a political scientist that he had single-handedly nullified an agreement entered into by two sovereign governments.

THE return of Bandaranaike to power in 1970 saw a reversal of this state of affairs. The nationalisation of plantations saw Indian Tamil people being evicted from the estates and landless Sinhala people being settled in their place. A large number of Tamil people were relocated in the Sri Lankan Tamil districts of North and East. In spite of the dire economic circumstances, a silent revolution was on within the Indian Tamil community. Aided by CWC leaders, more and more Indian Tamils were regaining citizenship and consequently voting rights. As more and more children grew up and reached the voting age of 18, the community's voting strength increased.

This empowerment became evident for the first time in the 1977 elections when, after 30 years, Thondaman was re-elected to the multi-member constituency of Nuwara Eliya-Maskeliya. He joined the UNP government of J.R. Jayewardene in 1978. The new Constitution of 1978 removed the distinctions between citizens of descent and citizens by registration. This put an end to many problems faced by Indian Tamils. As Minister for Rural Industrial Development, Thondaman was able to foster dairy projects and small industries among the Indian Tamil people. When it was found that there was a shortfall of 93,000 in the number of applicants for Indian citizenship and a corresponding excess for Sri Lankan citizenship. Thondaman persuaded the Jayewardene government in 1987 to grant citizenship unilaterally to this category and end for all time the "Thrishanku state" of the stateless people. Concessions were also gained in the case of Tamil people who had obtained Indian citizenship but were staying on.

Thondaman was successful in these attempts because of five factors. First, the increase in votes within the community and the CWC's ability to deliver them en bloc provided Thondaman considerable bargaining power. Secondly, the rise of political violence in the northeastern region of the country saw Colombo awarding priority to the needs of the Indian Tamils. Thirdly, India had begun to take greater interest in the affairs of Sri Lanka, thereby impelling governments in Colombo to remove possible irritants pertaining to the plantation Tamil community, which claimed an umbilical relationship with "mother India".

Fourthly, the CWC illustrated through well-executed strikes its capability to paralyse tea and rubber production. This provided economic clout, which enhanced the CWC's bargaining power. Fifthly, Thondaman enjoyed close personal relations with UNP leaders such as Jayewardene, Premadasa, Gamini Dissanayake, Lalith Athulathmudali and Anandatissa de Alwis, and used them to the advantage of his people.

The CWC contested several elections in association with the UNP. It was a mutually beneficial arrangement, which helped both parties to increase their representation. For the Indian Tamil people, it was a slow return to political representation after being in the cold for more than 25 years. The Indian vote helped Jayewardene and Premadasa win the presidential elections in 1982 and 1988.

The CWC contested the 1994 parliamentary elections along with the UNP under the latter's symbol of elephant. Seven of its candidates were elected and two persons, including Thondaman, appointed National List MPs. But the People's Alliance under Chandrika Kumaratunga won the elections with a wafer-thin majority. Thondaman then changed sides and became Minister of Livestock Development and Estate Infrastructure in her Cabinet. His colleagues, however, sat in the Opposition but supported the government during voting time. Thondaman helped increase the majority of Kumaratunga in the presidential elections, which were held subsequently, by once again delivering the bulk of the plantation Tamil votes.

In spite of certain problems and tensions, Thondaman remained supportive of Kumaratunga to the very end. When she opted to advance the elections to December 21 this year, the CWC decid-

ed to back her again mainly because Thondaman decided to do so in spite of some CWC MPs holding a different opinion.

Thondaman was a leader who helped his people with single-minded devotion for more than 60 years to realise their aspirations against overwhelming odds. The passing of the Tamil patriarch is an irreparable loss.

AS the undisputed leader of the Indian Tamil community, Thondaman enjoyed the reputation of being a king-maker in Sri Lankan politics. Even during the Provincial Council elections of April 6 early this year, Thondaman lived up to this sobriquet. He floated the India Vamsavali Makkal Perani. It won six seats in the Central province and one seat each in the Uva and Sabragamuwa provinces. Again, it was Thondaman who provided a narrow but effective majority that enabled the ruling alliance to form viable administrations in the councils of these provinces.

Thondaman was sympathetic to the problems of the Sri Lankan Tamil community but knew clearly that there was no uniform identity of interests. In 1961 he launched a plantation workers' strike as a demonstration of sympathy for the satyagraha campaign undertaken by Sri Lankan Tamils in the North and the East. However, against the Sri Lankan Tamil community's expectations that he would prolong the strike, he called it off early after making his point.

Thondaman cooperated with Sri Lankan Tamil political parties in forming the Tamil United Front in 1971. But when it metamorphosed into the Tamil United Liberation Front (TULF) and opted for a separate state in 1976, Thondaman opted out despite being elected as one of the triumvirate of its leadership. Tamil Eelam will not help resolve the problems of plantation Tamils was his practical credo. He campaigned for the TULF in 1977 and enlisted TULF support for the CWC in elections, but contested separately under the cockerel symbol instead of the rising sun symbol of the TULF.

He was also critical of the confrontational tactics of Sri Lankan Tamils, both violent and non-violent. He told this writer several times that the trouble with the TULF leaders was that they did not know how to negotiate. "The art is to put five demands, win one completely, gain partial compromises on two and put on hold the remaining two for another day. Since we are trade unionists, we know that art. But TULF leaders are all lawyers who only know how to argue their brief eloquently but not how to extract concessions," he said.

Thondaman was not overtly critical of the Liberation Tigers of Tamil Eelam (LTTE) or the armed struggle by Sri Lankan Tamils. His pragmatic proposal that power be handed over to LTTE leader V. Prabakaran for a stipulated period of time without being obligated to face elections was thoroughly misunderstood in the South. He was accused unfairly of collaborating with the LTTE to create a "Malaya Naadu" upcountry. But actually Thondaman strove hard to prevent violence entering the plantations. He knew that if the upcountry youth started emulating their northeastern counterparts, it would lead to tragedy. He approved of violence only as a means of self-defence. Thondaman was instrumental in preventing violence from overwhelming the plantations. His importance will be felt only in his absence.

He also had an earthy way of describing when to call off a strike and go in for a negotiated agreement. The comparison was to the cooking of dosa, a staple of Tamils. "The cook has to flip-flop the dosa alternately on the cooking tray so that both sides get cooked. It has to be taken off at the right moment. If this *pakkuvam* (finesse) is not adhered to, the dosa will be either burnt or not cooked well on one side. It is this *pakkuvam* of timing that is required in conducting strikes and negotiations. If the correct moment is not seized, everything will be lost."

THONDAMAN'S politics was that of brinkmanship at times. There was however deep subtlety to it. A major example is the plantation strike he launched while being a Minister in the Jayewardene government. "It was not a strike," Thondaman said, "but a prayer campaign where every worker would attend a place of worship and be there praying the whole day for a wage increase instead of working." To prevent personal pressure being exerted by Jayewardene, the wily Thondaman got himself admitted to hospital and got a no-visitors rule implemented. The government caved in to Thondaman's demand. There was no triumphant boast by Thondaman. "Prayers can move mountains. Our prayers have been answered," he said in a deadpan tone.

Thondaman was a man who could reconcile seemingly irreconcilable contradictions. An estate owner leading plantation workers, a Minister leading a strike against his own government, an MP elected on the UNP ticket sitting with the P.A. as a Minister – were some of these. When asked about these different aspects of his personality, Thondaman would say with a twinkle: "I am like the ideal woman. She can be a daughter to her parents, sister to her siblings, wife to her husband, and mother to her children, and remain the same woman."

The king-maker role he played and the pragmatic approach he adopted to the dynamics of politics fuelled resentment against Thondaman in certain chauvinist quarters. The fact that an "Indian Tamil" was helping make and unmake Presidents and administrations strengthened these feelings. Also, his role in resolving the problems of the Indian Tamil community was not fully appreciated by some sections of the community.

Whatever the misgivings and misunderstandings, there is no doubt that Thondaman was a leader who helped his people with single-minded devotion for more than 60 years to realise their aspirations against overwhelming odds. The passing of the Tamil patriarch is an irreparable loss.

Thondaman leaves behind a son, Ramanathan, three granddaughters and a grandson, Arumugam Thondaman. The grandson, in his early thirties, is both a Member of Parliament and the general secretary of the CWC and is tipped to be Thondaman's political successor. There is speculation that the CWC may split over the succession question. There was a time when the CWC had 600,000 members. Now the membership has dropped to around 350,000. Still it remains a force to be reckoned with. The reason for this is the astute and bold leadership of Thondaman.

If the CWC now splits, it can only lead to a disempowerment of plantation Tamils. This can only bring more misery to a pathetic section of Sri Lankan society. ■

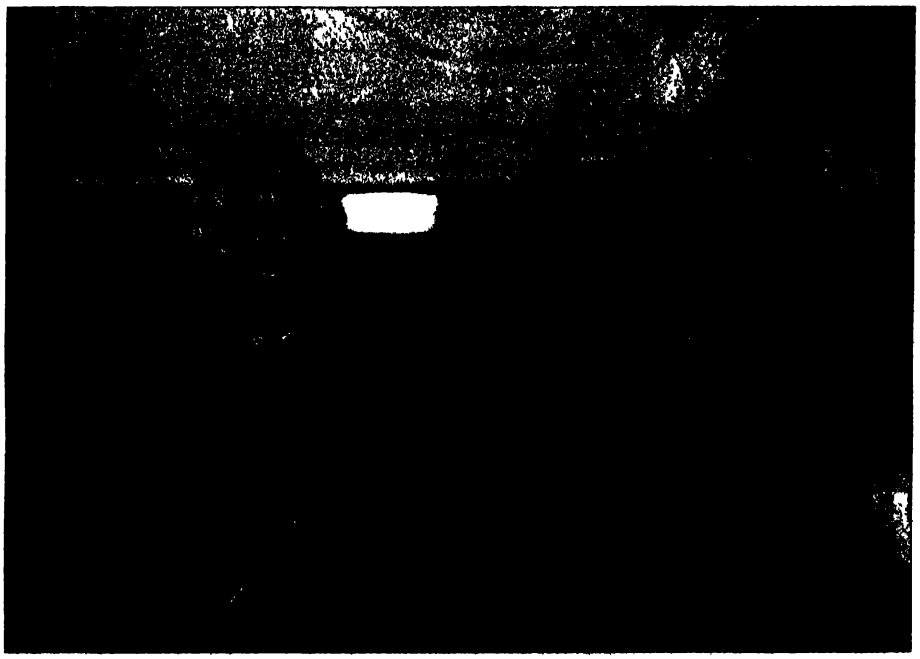
Victory for Centre-Left

Argentina elects Fernando de la Rua, the candidate of the Opposition alliance, the country's next President, ending 10 years of Carlos Menem's rule.

JOHN CHERIAN

IN the October 24 presidential election, the voters of Argentina, like their counterparts in other Latin American countries that went to the polls recently, voted against the *status quo*. Buenos Aires Mayor, Fernando de la Rua, representing Alliance, a coalition of Centre-Left parties, won the election comfortably, ending the decade-long rule by Carlos Saul Menem and the Peronists. The Alliance won 48 per cent of the votes polled and the ruling Justicialist Party (J.P.) 38 per cent.

The J.P. dominated Argentinean politics for most of the time since the military lost its grip over power in 1983. It was originally a populist party, inspired by the vision of Juan Peron, the late Argentinean strongman, and his second wife Evita. The Peronists had their political base among the working class and the progressive sections of the population.



Matters, however, changed dramatically after Menem became President 10 years ago. Although elected on a populist platform, Menem discarded the radical Peronist policies and embraced the free market. He also gave up the independent foreign policy pursued by his predecessor, Raul Alfonsin of the Radical Party. Argentina was an active member of the Non-Aligned Movement (NAM) and had close relations with many developing countries in Asia and Africa. Menem, however, went out of his way to identify the nation with the United States on almost all issues of international importance, ranging from disarmament to the inhuman economic blockade of Cuba. He put the Malvinas (Falklands) issue on the backburner, and he was given the privilege of lunching with the Queen of United Kingdom in the Buckingham Palace. On social issues, Menem's positions were incongruous: while he spoke out against abortion rights, like a conservative, he unabashedly revelled in the playboy image he so assiduously cultivated.

However, it was Menem's far-reaching structural adjustment programme that was the hallmark of his long stint. The principal components of the programme, inspired by the International Monetary Fund and the World Bank, were privatisation, deregulation and containment of inflation, which was rampant. (When Menem took office, inflation was in triple digits, the annual average rate being over 300 per cent. The cornerstone of his anti-inflation programme was the 1991 Law of Convertibility which pegged the peso with the U.S. dollar and required that the money supply have be kept on a par with the foreign exchange reserves deposited in the Central Bank.)

Inflation was curbed drastically within a short time: by 1997, it was less than 1 per cent. But the privatisation campaign has left the government with very little assets. Telecommunications, energy and public services sectors were privatised. Menem used the funds generated by the sale of the state's assets to build up foreign reserves and temporarily cushion the population from the harsh impact of the structural adjustment programme.

But in the last few years, budget deficit increased substantially. The rate of unemployment now stands at 14.5 per cent, twice as high as it was in 1990. Menem's free-market policies, although initially popular, have lost their allure. Argentina is in the grip of the worst recession of the decade and in all probability the gross domestic product will shrink by 3.5 per cent this year. Some 45 per cent of the children under 14 live in poverty.

THE Mexican daily *La Jornada*, while hailing the victory of the Alliance, said that it hoped the result would signal an end to free-market policies, which have meant a high rate of unemployment, rising inequality and corruption. The

Posters showing Carlos Menem as a candidate for the presidential elections in 2003, which appeared in Buenos Aires immediately after the results of the presidential elections were announced. Menem's Peronist party lost the elections after ruling the country for 10 years.

newspaper compared Menem's economic reforms with those of Augusto Pinochet of Chile and Alberto Fujimori of Peru. "The results (of free-market policies) were invariably a serious increase in social inequality, deepening marginalisation, poverty, concentration of wealth in a select group of individuals, families and businesses, and the looting of national assets," *La Jornada* said.

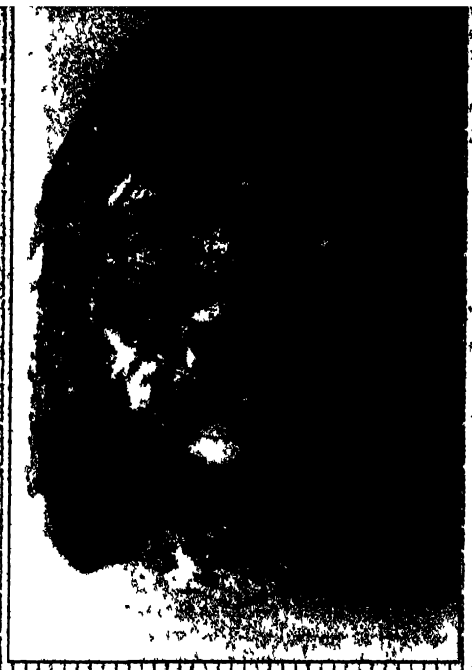
The corruption in the top echelons of the government contributed substantially to the unpopularity of the Peronists. The ruling party split into pro- and anti-Menem factions. Although barred by the Constitution from contesting for a third term as President, Menem tried for a re-nomination. He extended only lukewarm support to the J.P's presidential candidate, Eduardo Duhalde. The impression that had gained ground was that Menem would rather see an Opposition candidate win than live with another Peronist as President. Menem has vowed that he will run for President five years hence; posters declaring "Menem 2003. The country needs him" already adorn public places in Buenos Aires. Menem himself claimed that his presidency was "the best in history".

The Duhalde group replied with its own posters, accusing Menem of having contributed in a major way to the victory of de la Rua. It would have been difficult for Menem to get a re-nomination, with Duhalde in the presidential palace. Duhalde had in fact inched ahead of de la Rua in the middle of the year. However, the in-fighting among the Peronists affected his campaign. Several prominent Peronists refused to support him. Duhalde has refused to own up responsibility for the J.P's debacle, saying that he did not consider himself "the father of the defeat". Inner-party wrangles are bound to continue as the Peronists begin apportioning blame.

THE electoral results can be interpreted as a reversal of fortune for the Radicals. They had reached the nadir of their popularity in 1996, when their candidate, Horacio Massaccesi, won only 17 per cent of the votes. They were relegated to the third place in the country's two most populous provinces, Buenos Aires and Santa Fe. The Radicals thus came to the conclusion that if they fought alone it would result in a cakewalk for the Peronists. The decline of the Radicals coincided with the emergence of the Centre-Left Front for a Country in Solidarity, known by its acronym Frepaso, which was formed in 1994. The membership of Frepaso consisted mostly of disillusioned Peronists and members of smaller Centre-Left parties.

Several Frepaso leaders, such as Carlos "Chacho" Alvarez (who was de la Rua's running mate), have a clean image. However, the party's support base remained mostly confined to urban areas. On its own, it had no chance of coming to power at the centre: the best alternative before it was an alliance with the Radicals. Thus, three years ago Frepaso joined hands with the Radicals and formed the Alliance for Work, Justice and Education (the Allianza) to fight the provincial elections.

The Alliance's victory in the provincial elections in 1997 established the fact that there existed a credible alternative to the Peronists. The Alliance had made it clear at the outset that it would not tinker with the major components of Menem's economic policies and would not jeopardise the economic stability that the currency reforms had brought about.



Argentineans today are majorly preoccupied with the problem of unemployment, and not inflation. The other important problem identified by them is corruption, which rose significantly during Menem's second term. Transparency International, in its annual report on corruption, has placed the country among the 20 top corrupt countries in the world.

The Opposition used the theme of corruption very effectively in its electoral campaign. In a public opinion poll taken last year, residents of Buenos Aires identified the ruling party as the most corrupt. In all 51 per cent of the respondents considered Menem corrupt while 43 per cent considered Duhalde also corrupt. On the other hand, only 7 per cent thought de la Rua was corrupt. About 58 per cent of the respondents identified the Alliance as the political grouping best suited to tackle corruption; 22 per cent identified the Peronists as the party that could do the job. The opinion poll showed that Argentineans also wanted the judicial system reformed; 87 per cent of the respondents did not believe that all Argentineans were equal before the law.

The President-elect has a tough task ahead. The Senate is still dominated by Peronists. Many of the provinces, including Buenos Aires, the richest, are under their control. De la Rua has promised a war on corruption. This could mean investigations into the assets of Menem and his cronies. The Left-leaning Frepaso has been insisting on a thorough clean-up of the administration.

Argentina's neighbours are happy at the turn of events. Menem was interested only in the relations with the U.S. Mercosur, the regional trade bloc, weakened because of Menem's disinterest and in the wake of the shock devaluation of the Brazilian currency, the real. De la Rua is expected to breathe life into the embattled bloc. The leading Brazilian daily, *Folha de Sao Paulo*, said that Brazil would benefit from de la Rua's pragmatism because he was less inclined to look to the U.S. for political guidance. "He doesn't have Menem's fascination with the United States," it said. ■

ART

The Vollard collection

The collection of French art dealer Ambroise Vollard, who helped democratise fine art and brought it to the masses in the early 20th century, is on show in India. However, the collection is neither insive nor com

SUNEET CHOPRA

WORKS from the collection of the noted French art dealer, Ambroise Vollard, were on show from October 1 to 31 at the National Gallery of Modern Art (NGMA) in New Delhi. (The exhibition will now run in Mumbai from November 16 to December 15.) The works were largely gifted by his brother, Lucien, to the Leon Dierx museum in the Indian Ocean island of The Reunion in 1947, some eight years after the death of Ambroise in a car accident in 1939. They are neither a representative show of French art between 1880 and 1930, nor a true reflection of the eye of Vollard. For, like every dealer, some of the best works that came into his hands were sold to other collectors; for instance, Gauguin's *Woman With Fruit* and Cezanne's *Young Girl*, were sold for 8,000 francs and 22,000 francs respectively, to the art collector Morosoff in 1908. Vollard gifted others to museums in Paris – such as the well-known portraits by Cezanne and Renoir. Moreover, much of what remained with him was sold off by his brother immediately after his death. The museum in Reunion Island got only fragments of his collection.

Still, there is enough in these remains for us to reconstruct the passion of the times, based primarily on the enormous advance in the production of artists' colours. In fact, Cezanne (whose first one-man show Vollard organised when the artist was 56 years old) pointed out: "It is colours packed in tubes, so easy to carry, that enabled us to paint completely from life. Without these colours in tubes, there would have been no Cezanne, no Monet, no Sisley, no Pissarro. Nor in fact what the journalists would one day call Impressionism."

Indeed, it is the development of coloured pigments that is resplendent in so many of the works on show at the NGMA. And though there are only 22 paintings, one can see how the treatment of colour evolves from Gustave Caillebotte's landscape of the gate of his country retreat at Petit-Genneviliers in

Entrance to the Garden, oil on canvas, 90.8 x 70.8 cm, by Gustave Caillebotte (1848 - 1894).

1893, with his companion, Charlotte Berthier's figure as the subtle transition between the interior and exterior the canvas is divided into, accomplished by different tones of mauve, to a much more forthright use of colour in Louis Valtat's *Sea and Red Rocks* of around 1905, where he uses the bauxite rocks at Antheor along the Esteral Coast near his estate at Agay, to communicate a sense of upheaval. This was something that was in the air after the defeat of a major European power, Russia, by an Asiatic one, Japan, in 1904. It was an event that not only shook imperial Europe but also saw in 1905 the rehearsal for the dismantling of the Tsarist Empire and the birth of the Soviet Union just 12 years after. It was a vindication of the correctness of the first short-lived state of the working class, the Paris Commune, the importance of which was not lost on painters of that period in the French capital.

Valtat's landscape is not only an early example of Fauvism but also a warning of the crisis of the colonial system that Europe was facing at the time. One is inclined to think that the Japanese influence that permeates the work is not merely a stylistic choice. It reflects an understanding that the age of Eurocentric thinking was facing a serious challenge and had to be re-assessed. It definitely is a significant work as it is one of the two – the other being Maurice de Vlaminck's still life – that were actually gifted to the museum in 1911 by Ambroise himself

The still-life by Vlaminck, where powerful brush strokes highlight colour as an index of light bursting out upon one, something that is transformed in this work in a sequence that travels from bright red to the sharp white of the flowers in the vase, to diffuse areas of white in the blue behind it. One understands the relevance of this work in the light of Vlaminck's statement: "I wanted to set the Ecole des Beaux Arts on fire with my cobalts and vermilions, and with my brushes translate my emotions and feelings without giving thought to what had been painted before." With this, the break with the past is complete. The grandiose representational art of the Empire had been shown the door by the turn of the century by a more irreverent and experimental visual expression.

There is enough in the fragments of Vollard's collection to reconstruct the passion of the times, based primarily on the enormous advance in the production of artists' colours.

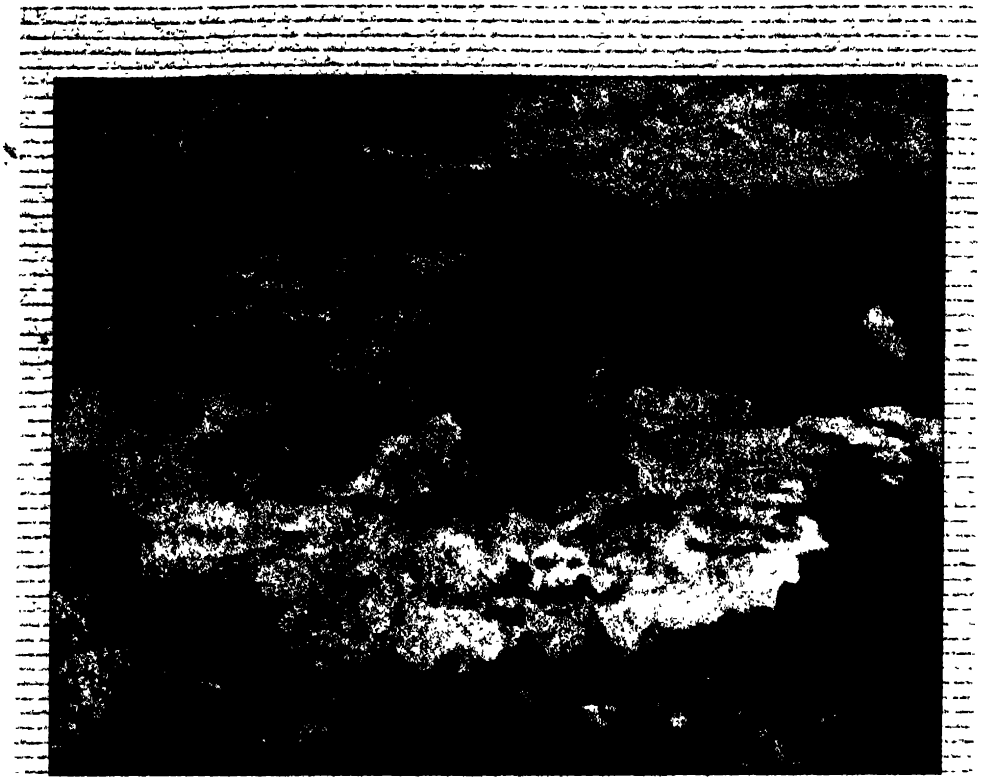
Everything that was previously rejected as wild and uncouth had come to the centre stage. Paul Gauguin's ceramic *Head of a Savage*, Picasso's *Mask* that was obviously influenced by African art, or Matisse's etching of a reclining Odalisque, all reflect a rejection of the colonial concept of a superior metropolis providing aesthetics for inspiration to the savages. Now the savages of yesterday

Spanish Women in Shawls, oil on canvas, 80 x 101.8 cm, by Francesco Iturrino (1864 - 1924).

The Frugal Meal, etching, 31.9 x 44 cm, by Pablo Picasso (1881 - 1973).

had become the inspiration for the metropolitan artists in a revolt against the past. An enormous change was overtaking imperial Europe.

This change had another dimension which has been reflected in this exhibition. The emergence of a democratic art for popular consumption that was made possible by the advance in engraving techniques and printing.



Indeed, prints were a life-long passion for Vollard, who admitted in his memoirs published in 1937: "I have always loved engravings. Almost as soon as I set up my base in the Rue Lafitte, in around 1895, my greatest wish was to publish them."

That he could get some of the finest artists of his age, like Henri de Toulouse-Lautrec, Auguste Renoir, Paul Cezanne, Paul Gauguin, Pierre Bonnard, Henri Matisse, Pablo Picasso, Georges Rouault and Marc Chagall, to create works for editions of lithographs or for books, helped break down the elitist barriers between fine and applied art. He brought fine art to the masses at a cheap price. Vollard not only used new techniques like paper transfers onto lithographic stone to ensure that art of a high standard could faithfully be reproduced, but he freed art from the salons of the Parisian elite and democratised it in the cellar and the book-store.

It is unfortunate that his editions of prints have not survived in the collection as a whole; but fragments that have, like Pablo Picasso's *The Frugal Meal* of 1904, the second and most significant print made by the artist on a salvaged zinc plate, are more than able to hold their own even singly.

Indeed, this print is so outstanding that the art critic Andre Salmon recorded in his memoirs the moment Vollard saw one in his home: "What a sidelong look that whimsical Vollard gave the two heart-rending figures of a poor couple at their beggarly table!" He later acquired the print. It is in the Dierx Museum collection today.

THIS brings us to the third element that characterises the art

Sea and Red Rocks, oil on canvas, 81.3 x 66.2 cm, by Louis Valtat (1869 - 1952).

[illegible] oil on canvas, 98.3 x 81 cm, by [illegible]

of the twentieth century – its radical content. Not satisfied with breaking away from Eurocentric aesthetics and elitist imperial art with its theatricality and pompous posturing, the *avant-garde* artists dared to challenge the continuing existence of poverty and oppression despite the industrial progress.

Indeed, it is no surprise that Picasso's greatest work *Guernica*, a persevering indictment of fascism and the destruction it wreaked in the Spanish Civil War, was started on May Day. This collection has other such works like *The Poor Fisherman* of Puvis de Chavannes, which Vollard commissioned in 1897, or the *Jesus in Agony till the End of the World* of Georges Rouault. It is evident that what made Vollard a successful dealer was his perception of an art of the future that would turn its back on Eurocentrism, that would be available to a wider section of people and would be critical of a *status quo* that had committed more crimes against humanity than any other social system known to mankind.

It is not surprising that such a vision for the arts found ready takers in the *avant-garde* of the colonies. One can see how the smile on the faces of the Spanish women of Francesco Iturrino in the 1920s saw its reflection in the self-portraits of Amrita Sher-Gil a decade later, while the Christ of Rouault reminds one of a similar theme both in F.N. Souza and Jamini Roy. Matisse and Picasso also find an echo in many of our best contemporary artists like K.K. Hebbar, N.S. Bendre and M.F. Husain. The vision that encompassed a rejection of imperialism, a call for democratising culture and for social justice, was something universal right through the twentieth century. That is why we relate to the Vollard collection so readily despite the fact that we know it is neither comprehensive nor complete. ■

A rip-tootin' campaign

WILLIAM SAFIRE

"VICE-PRESIDENT Al Gore today continued his efforts to put a new face on his presidential campaign," wrote Katherine Q. (for Quimby) Seelye of *The New York Times* from Nashville, Tennessee, "... promising supporters a rip-tootin' candidacy." His actual words were "a rip-tootin' campaign that is going to win in the year 2000."

I was not the only student of language who noticed that odd locution. Michael Kelly, next editor of *The Atlantic Monthly*, wrote in his column, "He has moved his campaign headquarters from, as he says, K Street to Main Street, the better to run what he, God help us, called 'a *rip-tootin'* race."

This term may have an Australian origin. In a review of Genevieve Lemon's one-woman show in Sydney, Pamela Payne of *The Sydney Sun-Herald* wrote in 1997, "This first one is *rip-tootin'* great."

More likely, Gore took the first part of *rip-roaring* or *rip-snorting* and married it to the last part of *rootin'-tootin'*. In linguistics, the linkage of the first part of a compound with the second part of another compound is called a *blend*.

Rootin'-tootin' was adopted by American slang from England's Lancashire dialect. Nodal and Milner's 1875 glossary of the local patois cites, "He's a *rootin' tootin'* sort of chap." George Bernard Shaw, in his 1907 play "Neolith," wrote, "The trumpet angel ... *root-a-tooted* at the sky." The meaning is "noisy, boisterous, lively"; the OED adds *rip-roaring*.

It strikes me as onomatopoeic, imitative of a trumpet sound, and was popularised in the United States by the 1924 song "*Roottin-toottin*-Lou From Kalamazoo." Since then, it has often been applied to cowboys: Russell Hayden was known in the 1930s and 1940s as the "*rootin', tootin'*, ridin' Romeo of the screen."

Rip, a verb meaning "tear," is rooted in the Flemish *rippen*, "to strip off roughly." In dialect, it is a combining form for expressions like *rip-stave, rip-snort* and the airheaded television presenter's *rip-'n'-read*.

When not meaning "tear," notes Joan Houston Hall of the Dictionary of American Regional English, "*rip* can mean 'to let out a wild yell or expletive' and in these combinations usually has to do with noise." It also means "to start noisily, frantically or suddenly," as in *let 'er rip*!

Rip-roaring's first citation was from *The Kentuckian in New York*, by William Caruthers, in 1834: "There was a *rip-roaring* sight of slight o' hand and tumbling work there." Two years later, the *Yale Literary Magazine* noted, "What a *rip-snorting* red head you have got!"

ANOTHER dialectical variant presents itself: This bids fair to be a *rootin'-roaring* campaign. And now to the metaphor used by George W. Bush to dissociate himself from what he sees as less compassionate conservatives.

When Republicans in the House suggested distributing an earned income tax credit to the "working poor" monthly rather than in a yearly lump, Bush said, "I don't think they ought to balance their budget *on the backs of the poor*."

This talk caused much anguish in conservative ranks, along with muttering about Clintonian centrist "triangulation," because the metaphor has a long Democratic history.

The Weekly Standard found a May 1977 use by Sen. George McGovern, charging that President Jimmy Carter was trying "to balance the budget *on the backs of the poor*, the hungry and the jobless." Soon after, Barney Frank, a disaffected liberal aide to Massachusetts Gov. Michael Dukakis, denounced his former boss for "balancing the budget *on the backs of the poor*." A decade later, as the Democratic candidate for president, Dukakis threw the identical charge at Vice President George Bush.

The earliest use I can find about the poor's burdened back came from a far-left group led by Rep. Vito Marcantonio, the Committee to Defend America by Keeping Out of War. Until June 1941, its slogan was "Take the burden of war *off the backs of the poor*." (After Hitler invaded communist Russia, the rallying cry switched overnight to "For Victory Over Fascism.") Earlier uses, I imagine, will also spring from anti-capitalist sources, which is why it so set Republican teeth on edge. Adding insult to rhetorical injury, Al Gore called for another increase in the minimum wage, adjuring the Republican-controlled Congress to "stop paying off their special-interest friends *on the backs of the working poor*."

In his own speech, Bush had also said, "Too often, on social issues, my party has painted an image of America *slouching toward Gomorrah*." This phrase was an ironic play on a line in a 1921 poem by William Butler Yeats: "And what rough beast, its hour come round at last,/Slouches towards Bethlehem to be born?"

The ironist was former Judge Robert Bork, who titled his 1996 book about America's moral decline *Slouching Towards Gomorrah*. (In the Bible, Gomorrah and its twin city, Sodom, were destroyed with fire and brimstone for their *rip-tootin'* iniquity. The escaping Lot's backward-looking wife is revered by arms-control advocates for being turned into a pillar of Salt II.)

Responding with rhetorical zest to this blast at his work from the Republican front-runner, Bork evoked the poorback metaphor in *The Wall Street Journal*, suggesting that Bush "gives the impression that the *backs of the poor* would be safe in his administration, but that he intends to reach the White House over the dead bodies of conservatives."

Politicians have to be careful about figures of speech; they can hurt themselves. The best admonition to those who would blithely practice rope-a-trope came from the 19th-century vituperator William Cobbett, who told a rival in political pamphleteering, "When I see you flourishing with a metaphor, I feel as much anxiety as I do when I see a child playing with a razor." ■

A novel of memory

SUSAN RAM

The Blue Bedspread by Raj Kamal Jha; Picador, 1999; hardback; pages 228, price not stated.

IN the years since *Midnight's Children* hit the publishing and reading world with explosive force, contemporary Indian writing in English has commanded a degree of attention and acclaim unimagined in earlier times of marginality and struggle. Much of this has been deserved. Young Indian writers have demonstrated linguistic flourish, inventiveness and imaginative power; they have contrived plots that twist and tease and surprise. Many have been able to render subcontinental experience accessible to readers foreign to its complexity. With their old-school groundings in the English language, they have proved deft in subverting its grammatical conventions and niceties. And with limitless material before them, they have contrived to push contemporary British fiction into a penumbra of provinciality and small concerns.

But this swift ascendancy is not all substance. Behind at least some of the hyperbole enveloping the new fiction from South Asia can be seen to lurk hardheaded business calculations. As literary publishing, once associated with a strong measure of editorial independence, becomes subsumed within vast corporate media empires, publishing decisions are increasingly governed by extra-literary criteria. Sales graphs loom larger, novelty is at a premium, and the search intensifies for the intriguing and the exotic. While not every aspiring young Indian writer may make it into the big time, one senses, among profit line-conscious publishing executives, an avidity for subcontinental wares that has an unhealthy edge. Indian fiction, it seems, is one of several bankable publishing flavours of the moment.

The Blue Bedspread, Raj Kamal Jha's first novel, exemplifies this ambiguity. In literary terms, there is much to commend it: the writing is in the main controlled, there are passages of great descriptive power, and the prose is permeated by a poetic sensitivity to language. It is also daring in its choice of theme: incest within the confines of Indian middle class respectability. But, somehow, it all fails to add up. The plot is thin, the characters receive so impressionistic a treatment that one cannot identify with them, and the journalist in Jha keeps surfacing, to the detriment of the fledgling writer of fiction. So deep and persistent are the problems evident in this book that one cannot help questioning the wisdom of the decision, by a major publishing house, to make it available to an international readership.

THE setting is Calcutta, the city of Jha's birth and growing up and the backdrop for an earlier phase of his career as a journalist (he now works in New Delhi as an editor with *The Indian Express*). In the West, Calcutta conjures up images of peculiar intensity: limitless squalor, shrouded bodies amid urban decay, a culture of indifference offset by the foil of Mother Teresa's ministering angels. Jha's Calcutta, however, is less an embodiment of poverty and deprivation than a place of sadness, shadowed by the past and haunted by secrets that dare not speak their name.

It is night, and in a house on a Calcutta street a middle-aged man sits at his typewriter. In the next room, a newborn baby lies asleep. It is soon established that these are uncle and niece, and that what has brought them together is tragedy: the man's sister has just died in childbirth. The next morning the baby is to be handed over for adoption; hence the urgency for the uncle to set down for his niece the stories he believes she will need when, far in the future, she goes in search of her own identity. Typing through the night, the nameless man unravels the past, knot by twisted knot. By daybreak, and the book's end, much stands revealed: areas of intimacy and pain; forbidden acts; quirks of fate; odd moments of happiness. And the most awesome secret of all.

This is quintessentially a novel of memory. For such a novel to work, certain ingredients need to be present. To begin with, it helps the reader to know whose memories are being summoned. Secondly, the memories need to be related, however tenuously, to the story that is being told. Thirdly, they should sustain a rising tension or atmosphere of suspense that carries the reader through momentary bafflement, compelling him or her to read on to the book's denouement.

Unfortunately, Jha makes compromises in each category. While most of the memories can be sourced, with some confidence, to the book's nameless protagonist, enabling a certain firmness of structure to take shape, the writer cannot stop himself letting the dead sister contribute her own soundings from the past. The results seem out of step with the body of the book, undermining its status as a soliloquy.

Memories, by definition, are random and ungoverned by considerations of linear time. That said, a novelist who places them at the centre of a narrative needs to arrange, select and prioritise, screening out passages that may represent self-indulgent use of collected material rather than a sensitive addition to character or plot. In Jha's case, one senses that the screening process has been nowhere rigorous enough. At one point, for example, the reader is led deep into the airconditioned ease of the American Centre Library in Calcutta. In descriptive terms, there is much to commend this passage. The vantage point is that of Calcutta's educated middle class, for whom the glossy building, with its facilities and textual references to totems of Western affluence, is a refuge from the hassle, the heat, the daily round of battles that is life in a modern Third World megapolis. There is surely a salutary message here for Western readers. But one fails to see how this piece of reportage relates to or enhances Jha's story. Nor does the author succeed

in using memory as means of tautening the plot or building tension. Given the book's title, one might have supposed that the blue bedspread – supposedly symbolic of childhood sanctuary from trauma, and also of activities beyond the pale of civilisational convention – would have been worked into the book as a recurring motif. In fact, the references to it are so sporadic and thin on the ground that it hovers as a device carrying little emotional or dramatic force.

All this disappoints because, in other respects, Jha reveals literary flair. He has an eye for the incongruities of human experience. how, for example, at moments of crisis our eye invariably fastens on some or other trivial or inconsequential detail. When told of his sister's death, the novel's protagonist looks out of the police station window to the passing trams and notes, with clinical accuracy, their cargo of black-and-yellow posters telling of a circus in the city: "Each poster has the same woman," notes the bereaved man, "a small woman in a tight-fitting shining dress balancing herself on a rhino's back. And a tiger smiling, its face ringed with fire."

At times Jha's prose takes on a rhythmic, musical quality that carries it to the borders of poetry. "When the city becomes a desert, hot and lonely," he writes, "when wherever you look, it all looks the same and the wind blows sand into your eyes, this building is an oasis. When the city becomes an ocean, wet and heavy, when the crowds are waves hammering your body, pulling you down, this building is an island." One can readily visualise this passage set as verse vertically down the page, calling to be read aloud.

There is also some pleasing imagery. At one point, Jha casts Calcutta as a solace to the lonely, an avuncular presence that seeks listeners to its stories, admirers of its faded and decaying grandeur. Such ideas gently subvert the received wisdom, still active in the West, regarding Calcutta and its putative 'black hole' character.

But all this does not a novel make. For all the colour, the musicality of the prose, the sincerity of the writer's efforts to explore forbidden zones of human experience, this is not a book to leave you moved. The muted aquatint tones achieved in the best of the writing suggest directions Jha might take as a creative writer: poetry might be one of them, the miniature canvas of short-story writing another. One hopes he explores such avenues before venturing into a second novel. ■

■ BOOKS

Modernity writ large

K.N. PANIKKAR

The Reflections of a Hen in Her Last Hour and Other Stories by Paul Zacharia; Penguin, 1999; pages 218, Rs.200.

THE short stories of Paul Zacharia, firmly embedded in the ethos of modernity in Kerala, are of an exceptional order. As the author has said in the preface to this collection – his second in English – they reflect the creative sensibility engendered by modernity in Malayalam literature.

Both in content and form the 22 stories collected in this volume, written over the last 30 years, comprehend the modern in a very striking fashion. Even among the modernists, Zacharia stands apart; in craft, in ideas and in commitment. Modernity for him is not merely a way of interrogating the reality, but an article of faith. This is stated unambiguously: "To me modernity is a password. It is the last straw – not the one that breaks the camel's back but the one a drowning nation clutches at. Instead, we are being offered, piously, the golden past."

The articulation of modernity in developing countries is often attributed to the influence of the West: a superimposition and replication of borrowed ideas. Many therefore hold that modernity in literature has an unreal ring about it. Such a view does not take adequate cognizance of the internal changes in society. For instance, modernity in Malayalam literature has its roots in the social transformation and ideological influences that besieged the Malayali mind in the twentieth century. How the creative minds in Kerala negotiated the impact of these changes is yet to be seriously addressed, considering the complexity of this intellectual process. The universe of Zacharia's short stories is this changing social and ideological world and the ambiguities, anxieties and uncertainties generated by it in individual life and social relations. While mapping the contours and contradictions of this universe with remarkable restraint on the use words, Zacharia assumes the role of both a narrator and a critic.

Malayalam literature has a healthy tradition in the art of story telling, going back to the second half of the nineteenth century. Short stories became a major and popular genre with the arrival of Thakazhi Sivasankara Pillai, Vaikkom Muhammad Basheer, P. Keshava Dev and S.K. Pottekkad in the second quarter of the century. M.T. Vasudevan Nair, T. Padmanabhan and Madhavikutty (Kamala Das) anticipated the modern, more in content than in form. They largely remained within the parameters of a 'conventional' narrative mode, comprehending within it a story or an event. Their ability to portray intense human emotions was remarkable, which produced some of the most powerful and moving stories ever penned in Malayalam literature. Yet they did so without substantially altering the form in vogue, although they reformed and refined it.

Zacharia's stories, like those of other practitioners of modernity – O.V. Vijayan, M. Mukundan, M.P. Narayana Pillai, to mention a few – brought about a qualitative change in the art of the short story, in its form and meaning.

Zacharia appears to be constantly experimenting with the structure of his narrative. By doing so he has developed a mode in which the multiple meanings of the story are continually constructed and reconstructed within the structure of the narrative. In fact, Zacharia hardly tells a story, he only engages the reader to construct a story and its social meaning from what he has privileged as the significant moment.

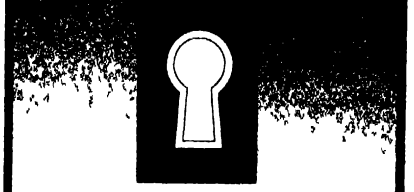
Zacharia wrote several of his short stories while living outside Kerala. (Was it accidental that most of the progenitors of modernity in Malayalam

wrote in 'exile'?) Yet, Zacharia's preferred domain is the life in Kerala, that too of Christians, which he knows more intimately than of others. But he is not a *Christian* writer, as a contemporary recently described him. Through the experience of Christians he tries to arrive at the general and the universal. "Till You See the Looking Glass" and "A Day's Work" are good examples. The latter is a remarkable story, both in meaning and form. It is written in the form of a letter to a nurse about an old woman whose children are all living in different parts of the world.

The universe of Zacharia's short stories is the changing social and ideological world and the ambiguities, anxieties and uncertainties generated by it in individual life and social relations.

The family is extremely rich, possessing all modern amenities – cars, air-conditioners, digital cinema and the rest for the use of a woman who is almost in a state of coma. The children, despite their affluence, or because of that, are not able to spare any time to look after the mother. The account of the daily routine of the old woman that the nurse was required to maintain becomes a metaphor for the pathos and tragedy of the nature of modernity Kerala has embraced. The interface with tradition and modernity and the ambiguity and anxiety it has generated in society inform several other stories.

Zacharia is provocatively critical to the point of being irreverent. The disapproval arising therefrom is sharp and unmistakable, but couched in a style that is persuasive and convincing. "Some Mechanical Inventions for the Benefit of Mankind" is a delightful story, which is a commentary on what man has made out of technological progress. Some of the inventions achieved are the avenging lightning conductor, the lover's moonlighter machine, the bird-bashing machine, the machine to locate the truth in newspapers, the machine to identify revolutionaries in a crowd, etc. The moonlighter machine is intended, for instance, to create moonlight for the romantic bliss of lovers and the bird-bashing machine is to prevent bird droppings on the statues of political leaders!



The ultimate among the inventions is the atom bomb, which has its uses as the advocates of deterrence would have us believe. "It is true that our side won the war by dropping the atom bomb, but it is also true that if it is dropped somewhere close to us the next time, in one moment, we will all become shadows on the scorched earth without even the time to die properly; mere apparition in burned silhouettes on the bathroom wall or on the court-building, etc. – that is if the walls are still standing. But how can we teach our enemies a lesson without the atom bomb? Do you honestly think that our enemies will listen to us if we don't drop our bomb over the street where their children play, over the hospitals where their sick lie, over the rooms where their lovers embrace? After all what are we if we don't love our country?"

Anti-war and anti-nuclear sentiments are also part of "My Military Memoirs" and "The Brick and the Mason". The former exposes the absurdity of war through the experience of person eager to participate in the war against the Chinese. He however, finds himself cheated of action, as the war gets over before he reaches the front. In the latter, the protagonist Babu, a petty criminal lodged in jail, is served a ladleful of *payasam* on May 12, 1998 to celebrate the happy day on which three atomic bombs were exploded. The superintendent of the jail announces "a meeting of all inmates in the evening... and readings from various scriptures" to express "gratitude to the nation". On hearing the announcement, Babu withdraws the hand that he had extended to receive the *payasam*. "The Brick and the Mason" and "Till You See the Looking Glass" are perhaps two outstanding stories in the collection.

To the outside world Indian literature is represented by what is written in English. Recently an anthology of Indian writings edited by Salman Rushdie has sought to legitimise and popularise this bias. In the present global ideological and cultural climate, it is not easy to correct or overcome this tendency. More and more translations from Indian languages, in which the literary creativity of our society is best expressed, are perhaps a remedy.

The publication of the short stories of Zacharia, an outstanding practitioner of this genre of literature, is therefore welcome. ■

The real story. Every time

Pakistan's tragedy

A.G. NOORANI

Pakistan: A Modern History by Ian Talbot; Oxford University Press; pages 432, Rs.625.
The Pakistani Voter: Electoral Politics and Voting Behaviour in the Punjab by Andrew R. Wilder; Oxford; pages 341, Rs.495.
Chief Justice Cornelius of Pakistan: An Analysis with Letters and Speeches by Ralph Braibanti; Oxford; pages 389, Rs.575.
A Journey to Disillusionment by Sherbaz Khan Mazari; Oxford; pages 646, Rs.795.
Pakistan – A Dream Gone Sour by Roedad Khan; Oxford; pages 263, price not stated.

THESE books help a lot to expose the latent forces beneath democratic government in Pakistan which asserted themselves on October 12 to subvert it. Ian Talbot is an academic who has written extensively on the history of Pakistan. His book is a dependable textbook, except for a few astonishing errors. Prime Minister I.I. Chundrigar was a Bombay lawyer, not a "businessman". The 1956 Constitution did embody "the Westminster model". The President's powers were defined in language identical to that used in the Indian Constitution. His resume ends at the nuclear tests of 1998. The biographical notes and copious footnotes make it a good work for reference. It does not end on a note of optimism.

The titles of the memoirs of Roedad Khan, a powerful bureaucrat who served successive regimes, and of Sherbaz Khan Mazari, one of the most upright politicians in the subcontinent, sum up their despair. Mazari, sirdar of one of the leading tribes of Baluchistan, ended his political career in 1988, predictably, in electoral defeat. He has won the respect of all who knew him for his uncompromising integrity, wide reading and affable dignity. His is one of the finest private libraries in our region.

Why has Pakistan come to such a [illegible]? The reason is that it inherited a [illegible]gal tradition" and its founding fathers did not give democracy a chance to flourish. As Governor-General, Mohammed Ali Jinnah presided over Cabinet meetings and even kept some portfolios to himself, flouting the basics of parliamentary democracy. He intrigued against his own Prime Minister, Liaquat Ali Khan, and got the Cabinet to resolve, on December 30, 1947, "that no question of policy or principle would be decided except at a Cabinet meeting presided over by the Quaid-i-Azam and that in the event of any difference of opinion between him and the Cabinet, the decision of the Quaid would be final and binding". An entry in his notebook, dated November 30, recorded: "Kashmir – no commitment – should be made – without *my approval of terms* of settlement. Mr. Liaquat has agreed and promised to abide by this understanding" (emphasis as in the original) (Hasan Zabeer, *The Times and Trial of the Rawalpindi Conspiracy 1951*; Oxford; pages 120-121).

Jinnah did not stop at that. In an address to the officers of the Staff College, Quetta, on June 14, 1948, he said that "the executive authority flows from the Head of the Government of Pakistan, who is the Governor-General and, therefore, any command or orders that may come to you cannot come without the sanction of the Executive Head".

This, he knew, was sheer nonsense. He was the constitutional head of state. The head of government, the chief executive, in a parliamentary system is the Prime Minister. He apparently believed in a one-party state. But Prime Minister Liaquat Ali Khan also said, in October 1950, that "the formation of new political parties in opposition to the Muslim League is against the interest of Pakistan".

During its agitation for Pakistan, the League had built up a culture of intolerance of dissent. "These attitudes were carried over into the independence era," Talbot notes. The Communist movement was crippled in the wake of the Rawalpindi Conspiracy Case. The radical tradition in the League, represented by Mian Iftikharuddin in Punjab and Abul Hashim in East Pakistan, was crushed. "Four important inheritances from the freedom struggle can be identified as exercising a profound inheritance on post-colonial developments." Talbot lists them as "poor institutionalisation of the Muslim League"; the clash between regional and Pakistani identities; "the low level of political culture in the Muslim majority areas"; and the vagueness about "the nature of a future Pakistan state".

The services of the army and the bureaucracy were enlisted in the naked struggle for power between the League's factions. They too were very willing to help in order to acquire control of the levers of power through politicians. As Ayesha Jalal demonstrated in her fine work *The State of Martial Rule*, the army stepped in not because democracy had failed in Pakistan. The army and the bureaucracy had begun undermining democracy with the active help of the very people who were supposed to run democratic government – the politicians.

Jawaharlal Nehru wrote to Prime Minister U Nu of Burma (now Myanmar) on November 11, 1953, apropos U.S. military aid to Pakistan: "As its army develops, the military mentality will spread. As it is, the Pakistan army is a domineering influence there. The army officers have considerable contempt for the civil government and it is a possibility for military coups (sic in plural) to take place."

Remarkably insightful. But the very Volume 24 of *Selected Works of Jawaharlal Nehru* (second series; page 421) which contains this also exposes how insincere he was in his accord of August 21, 1953 on a plebiscite in Kashmir. Rajiv Gandhi ratted on the Siachen agreement with the elected Government of Benazir Bhutto in June 1989. I.K. Gujral did likewise with Nawaz Sharif in May-July 1997. India's hardline policy impaired civilian governments and strengthened the army. The A.B. Vajpayee regime's intransigence in the talks in November 1998 led to the Kargil venture of Pervez Musharraf, the Chief of the Army Staff in Pakistan. Ayesha Jalal has established the fact of British and U.S. support in advance to those who carried out a coup in 1958. Not once has military rule succeeded in tackling the country's problems. Each military dictator – Ayub Khan (1958-

69), Yahya Khan (1969-71), and Zia-ul-Haq (1977-88) – left the country in a worse shape than he found it, his family enormously enriched, bar possibly Yahya.

Samuel P. Huntington's seminal work *Political Order in Changing Societies* (1968) was extravagant in its praise of Ayub Khan. "More than any other political leader in a modernising country after World War II, Ayub came close to fulfilling the role of a Solon or Lycurgus, or "great Legislator" on the Platonic or Rousseauian model." Ayub Khan quit in disgrace in 1969.

Gen. Pervez Musharraf is mistaken if he imagines that the people of Pakistan do not love liberty. Its journalists fought Zia-ul-Haq's regime far more courageously than did many Indian journalists during Indira Gandhi's dictatorship.

Z.A. Bhutto was uniquely qualified to stamp out Bonapartism when he assumed power in December 1971. The Army had been disgraced in the Bangladesh war. Yahya Khan had failed miserably on the home front. But Bhutto's corruption and authoritarianism, which climaxed in the rigging of the March 1977 elections, led to a virtual revolt. Having failed to build up his Pakistan People's Party (PPP) as an institution with a life of its own, Bhutto sought the army's support. The army exacted its price and established martial law in July.

Not a few in the Opposition – *particularly* the darling of the Indian establishment, Wali Khan – collaborated with Zia and encouraged him to destroy Bhutto politically before he could fulfil his promise to hold elections. Leading lawyers and a good many journalists backed Zia. One reason why he struck so ruthlessly was Bhutto's attempt to politicise the corps commanders and divide the army. It was the army that tried to rig the 1988 elections in a desperate bid to rob Benazir Bhutto of victory, and rigged the polls again in 1990 to prevent her return to power. The beneficiary was Zia's creation, Nawaz Sharif.

Ian Talbot notes: "Election-rigging, like selective accountability, is a tradition deeply rooted in Pakistan's history." The distinguished scholar Mohammed Waseem wrote in an excellent study of the 1993 elections: "Rigging is now a part of the electoral contest in terms of the rival candidates' ability to cast bogus votes and get away with it." There was no concept of power-sharing. As during the Raj, the state ruled through feudal intermediaries, especially in west Punjab. Talbot's remarks on the 1997 crisis, which resulted in the departure of both President Farooq Leghari and Chief Justice Sajjad Ali Shah is very perceptive: "The army, far from being excluded from national life by the now unchallenged political leadership of Nawaz Sharif, became closely involved in what might be considered routine civilian administrative tasks. The official explanation for this was to encourage a people-friendly army, but in reality it was a response to the serious institutional decay which, throughout Pakistan's history, had undermined democratic stability. The corruption and politicisation of the administrative services by successive governments had accelerated this process."

Gen. Pervez Musharraf is gravely mistaken if he imagines that the people of Pakistan do not love liberty. Its journalists fought Zia's regime far more courageously than did many Indian journalists during Indira Gandhi's dictatorship. In 1983 the Movement for the Restoration of Democracy (MRD) shook Zia:

"Massive repression was required to crush the MRD agitations in the Sukkur, Larkana, Jacobabad and Khairpur districts. The Sindh Governor was forced to admit that in the opening three weeks of the struggle, 1,999 people had been arrested, 189 killed and 126 injured.

"Resistance took literary and cultural forms. Writers and poets like Rehmatullah Manjothi, Naseer Mirza, Tariq Alam and Adal Soomro challenged Zia's ideological state. Atiya Dawood opposed the oppression of women in her writings... Unlike the mass movement against Ayub in 1968-69 or against Bhutto in 1977, the 1983 agitation in Sindh was not just an affair of the urban middle class and workers. The rural population of such districts as Thatta, Dadu, Larkana, and Sanghar were heavily involved. Leadership was provided by the PPP and the 'peasant'-based Sindhi Awam Tehrik of Rasul Bux Palejo. The rural insurrection was only finally quelled following the deployment of three army divisions backed up with helicopter gunships."

ANDREW WILDER was born in Pakistan and lived, studied and worked there for more than 25 years. His study of electoral politics in the Punjab until the 1977 polls challenges the conventional wisdom that voting decisions are determined by social factors. He holds that "political rather than social factors are increasingly determining" voters' decisions. Policies matter. It is a very instructive work.

Pakistan's judiciary has been supine, but it has produced some outstandingly fearless judges such as Dorab Patel, Rustom S. Sidhwa, M.R. Kayani and A.R. Cornelius, who rose to be Chief Justice of the Supreme Court. His classic solitary dissent in 1955, when the majority led by Chief Justice M. Munir upheld the Governor-General's dissolution of the Constituent Assembly on October 24, 1954, merited reproduction in full. Braibanti's detailed "analysis" could have been much briefer without any loss to the reader who would have preferred more of Cornelius and much less of Braibanti.

Mazari rightly calls Munir "a blight on our legal system... If a man ever rightly deserved to be tried for contempt of court (for his blatant disrespect for the independence of the judicial system) it was former Chief Justice Munir." During the interregnum between President Iskandar Mirza's abrogation of the Constitution on October 7, 1958 and Ayub's ouster of Mirza three weeks later, the Chief Justice participated in a meeting at which "Prime Minister" Ayub Khan asked him "as to how he should go about getting a new Constitution approved by the people." Munir's reply – publish the draft and get it adopted at a public meeting – aroused derisive laughter. The Commander-in-Chief of the Air Force, Mohammed Asghar Khan, who was present, recorded in his memoirs, *Generals in Politics*, that "Ayub Khan laughed the loudest". Asghar Khan aptly remarked: "No wonder that Pakistan has found it difficult to shake off martial law ever since" (page 7).

Munir legitimised Ayub Khan's martial law after he had counselled thus. The Supreme Court legitimised Zia's coup as well. It is likely to repeat the performance now. Judges were not the only culprits. A.K. Brohi, a favourite of the Congress for Cultural Freedom and the International Commission of Jurists, consistently lent his services to military dictators – Ayub, Yahya and Zia. So did

the lawyer Syed Sharfuddin Pirzada, now a member of the Pervez Musharraf regime.

Mazari remarks: "Both these legal peddlers (Brohi and Pirzada) made their 'high' reputations on advising the establishment on how to legally avoid their constitutional and lawful responsibilities. Most of our draconian amendments to the Constitution in recent times bear the finger-prints of one or both of them." In 1981, Zia made a Provisional Constitutional Order. "The prime movers behind this unprincipled and unparalleled piece of jiggery-pokery were none other than Messrs. A.K. Brohi and Sharfuddin Pirzada. These two men were later scathingly described by Gen. Chishti (a participant in Zia's coup) to be among Zia's most prominent 'sycophants'." Musharraf has followed suit with his PCO, on October 15, 1999, drafted presumably by Pirzada. Mazari's book is more than a memoir. It is well researched and has precise footnotes which make it invaluable for reference.

His disclosures on Wali Khan's lack of scruples should surprise none who followed his politics. He virtually prodded Zia to kill Bhutto.

A DEMOCRACY can be sustained only by a leadership – in all walks of life, but particularly among lawyers, journalists and intellectuals – which is committed to democratic values. It helps awaken the masses and mobilise their support for democratic governance. There are brave voices in Pakistan which have spoken up at this dark hour; I.A. Rehman, for instance. Pakistan's democracy came to grief because there were not many of his kind. Zamir Ansari's classic *Press in Chains* chronicles both the betrayal by many and the brave resistance by some. Politicians were the worst of the lot. Bhutto won power with the help of the army in 1971; Benazir, after an understanding with it in 1988; Nawaz Sharif in 1990, Benazir in 1993, and Sharif, again, in 1997, all owed power to the army's support.

Each dictator looted the state and left behind sons who bask in that ill-gotten wealth. Ayub's son, Gohar, was a captain in the army. He became a major business magnate when the General Motors car assembly plant was converted to Gandhara Motors, owned jointly by Gohar and his father-in-law, *General* Habibullah Khan Khattak.

Mazari records: "His other holdings included an investment company and a canning venture. The retired Army captain's wealth was estimated by foreign specialist, Dr. Franz Pick, a few years later, to be in the vicinity of U.S. $4 million. Dr. Pick also estimated the total wealth of Ayub Khan and his family to be in the range of U.S. $10 to $20 million. For a man who had, only a few years earlier, forced his way to power at gunpoint with the self-professed aim of eradicating the corrupt 'sharks and leeches', this was a savage indictment."

Mazari cites in support Franz Pick's *World Currency Report*, April 1969. He also records:

"Taking shelter behind his regular protestations of Islamic piety, Zia and his close companion General Abdur Akhtar Rehman managed to accumulate the most ill-gained wealth of all. The damning evidence of their corruption was revealed by none other than Akhtar Abdur Rehman's son, Humayun Akhtar. Shaheen Sehbai, then the Islamabad correspondent of *Dawn*, writing about General Akhtar Abdur Rehman, related a revealing incident. 'The riches remind me of a story told by (Humayun Akhtar Abdur Rehman) to me and other journalist friend in the early hours of one fine morning in the five star luxury hotel of Islamabad. All three of us were in good spirits and the General's son was speaking mostly against another son of a General, his one time friend but now deplored foe, Ejaz-ul-Haq.

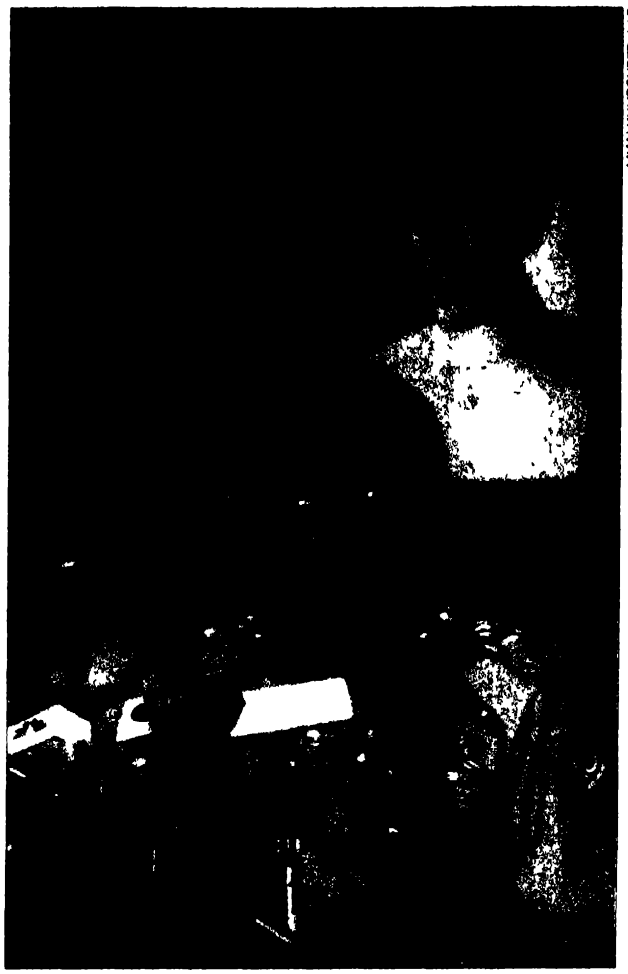
"'What does he boast about? He thinks he has a lot of money. I have made him a politician. I called him from the Gulf to play politics. He knew nothing and had nothing. What if now he has 250 million dollars. Is that all? Look at me, God has given us everything. Everything I say, Ejaz just has peanuts', he said thumping his chest with a straight hand.

"When we had left the hotel, we were wonder-struck at the audacity of the claim, but the revelation that Ejaz-ul-Haq was such a rich man had been drowned with the thought of how big the booty would be that he described as 'everything'."

Sehbai repeated the story in his columns *on two occasions*. The references are *Dawn*, June 11 and October 16, 1993. This very Ejaz-ul-Haq, a Minister in Sharif's Cabinet, lost no time in making overtures to Musharraf. Zia "was said upon his death to have left a sum of $250 million behind for his family." Akhtar Abdur Rehman was more generous.

Roedad Khan's memoirs reproduce full texts of documents of Reference to the Accountability authorities against Benazir. She learnt the ropes from her father. "A U.S. investigation of PIA's purchase of DC 10 aircraft stated that 'prosecutors uncovered evidence that senior executives (of McDonnell Douglas Corporation) had paid bribes to a relative of former Pakistani President Zulfikar Ali Bhutto. The bribes amounted to (U.S.) $500,000 for each aircraft purchased by Pakistan's national airline.' Persistent rumours over the years also maintain that Bhutto pocketed a large portion of the millions of dollars that Libya donated as earthquake relief funds for victims in the Northern Areas in the early 1970s. Undeniably, after Bhutto's execution, his family could neither have maintained their lifestyle nor their various residences in London, Avignon, Cannes and Damascus, Karachi and Larkana simply from the income derived from their small farm landholdings in Sindh." Trust Mazari to provide the supporting evidence – *Friends in High Places: The Rise and Fall of Clark Clifford* by Douglas Franz and David McKean (1995). One columnist who has maintained ceaseless vigil and written documented exposes fearlessly and impartially is Ardheshir Cowasjee, a weekly columnist with *Dawn*.

What of Mian Mohammed Nawaz Sharif? Listen to Mazari:



"Coming from a minor business family in Lahore, he had entered political affairs in 1982 when he was appointed a provincial minister by the martial law regime. Favoured by General Jilani, then Governor of Punjab, Nawaz Sharif rose to become the province's Chief Minister. Starting with only a seventh-share in a family-owned steel foundry, the Sharif family's business fortunes prospered at an electrifying speed and it soon became one of the wealthiest in the country. As *Dawn*'s weekly columnist Ardeshir Cowasjee commented: '... in the first place the Sharif family would not have been able to borrow even five per cent of what they did borrow had Nawaz Sharif not been firstly finance minister of Punjab, then its chief minister, and finally prime minister of the country, in all of which positions he misused his powers to borrow what was borrowed, to amass what was earned, and to issue SROs (government regulatory orders) for the particular benefit of his family's businesses.' General Zia's long period of rule began a binge of crony capitalism that would eventually lead to the creation of vast sums of newly created wealth among a

handful of families. It helped destroy Pakistan's banking system and later its economy.

"Unlike Benazir, Nawaz Sharif had little chance to acquire an understanding of the nature of democracy. At a relatively youthful age he had obtained power as a provincial minister and grew accustomed to using it. *While Benazir knowingly flouted virtually every precept of democracy, Nawaz Sharif knew little about them.*"

Pervez Musharraf would do well to recall the account of the events of those days by Roedad Khan, Secretary in the Ministry of Interior during the Zia regime. His memoirs record in authoritative detail the army's role in toppling Benazir on August 6, 1990 (page 109) and Nawaz Sharif on April 18, 1993 (page 123). Restored to office by the Supreme Court, he was forced to resign – by the army (page 132). Formally the action was taken by President Ghulam Ishaq Khan in 1990 and 1993.

It is the 9 Corps Commanders who rule Pakistan. Zia saw to it that the collegium became his instrument. How Pervez Musharraf tackles them remains to be seen.

MIAN KHURSHEED / AP

General Pervez Musharraf addressing a press conference in Islamabad on November 1, with a portrait of Mohammed Ali Jinnah for backdrop.

Roedad Khan rose to become "Minister for Accountability" on August 11, 1997. His comments on the judiciary as also on the farce of accountability are scornful.

"So what lessons might be learnt from this experiment in accountability? First and foremost, that people have lost faith in the objectivity and impartiality of the two most important pillars of the state, the Presidency and the judiciary, the two watchdogs charged under the Constitution with the responsibility of keeping a strict watch on the excesses and arbitrariness of the executive and the conduct of the holders of public office. Secondly, accountability has been reduced to a farce. In the name of accountability, successive governments have hounded, harassed, and persecuted their political opponents with the connivance of a corrupt administration. On the other hand, acts of gross misconduct, abuse of office, betrayal of trust, rampant corruption, and violation of oath of office by holders of public office go unpunished. Nobody in this country, neither the Government, nor the opposition, nor the judiciary, is interested in accountability as it is understood in the West.

"*Thirdly, no matter how honest, upright and well-intentioned you may be, your chances of bringing the guilty – be they holders of public office or civil servants – to justice under the existing judicial system and in the prevailing political environment are almost nil. It is, therefore, an exercise in futility and a total waste of time, energy and public funds.*

"Fourthly, people have lost faith in the holders of public office and the institution of Parliament which no longer represents the general will or the hopes and aspirations of the people, and nobody sheds any tears when the Assembly is dissolved."

His resume ends with Sharif's return to power in February 1997. But, he wrote of the caretaker government: "The new government has publicly stated that it has not been able to gather enough evidence to act against top politicians, including Ms. Bhutto, her husband Asif Zardari, and the former Prime Minister, Nawaz Sharif. I find this difficult to believe. Either they were not trying hard enough or, what is more likely, a political decision had been taken not to proceed against the mainstream political leaders. Be that as it may, the admission of Prime Minister Malik Meraj Khalid appears to mean that known corrupt people are being foisted upon our poor illiterate electorate and the general elections scheduled for February 3, 1997 will once again be a contest between two sets of corrupt politicians, representing Ms. Bhutto's People's Party and the Pakistan Muslim League led by Nawaz Sharif. Many Pakistanis were hoping that both Ms. Bhutto and Nawaz Sharif and a large number of their corrupt partymen would be disqualified on grounds of corruption from participating in the elections."

One wonders whether the 'Chief Executive' of Pakistan will do any better. The Army is no custodian of democratic values or norms of rectitude. Not a few Corps Commanders in the past enriched themselves in the manner of politicians, especially by land-grabbing.

Pervez Musharraf is in a difficult situation. He cannot impose press censorship for fear of inviting world censure. The press will report public disquiet as it increases. If he prosecutes some, charges of harassment will be made. If he holds elections, the two best organised parties will contest – Benazir's and Sharif's. He cannot prevent that unless he destroys them politically and incurs the odium – unless, of course, his accountability process truly works fairly and impartially.

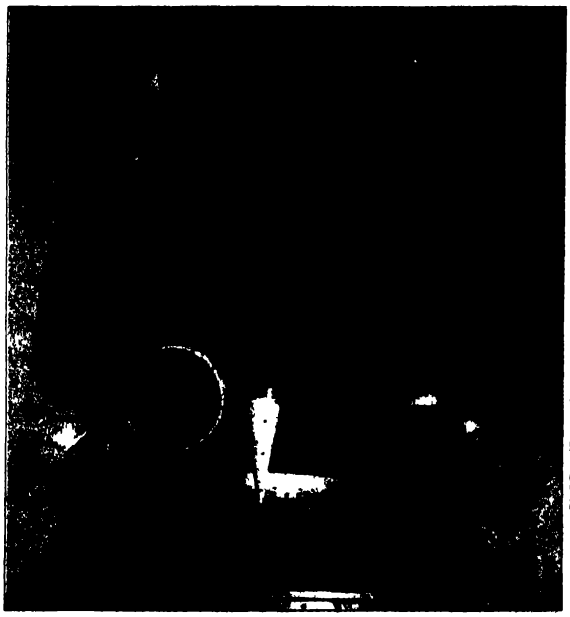
It is unlikely he will restore the 1973 Constitution without ensuring a constitutional role for the army – and thus warping democratic government.

Tailpiece: In land grabbing by Corps commanders, the corner plot was valued most. The story goes that one of the more enterprising Corps Commanders, while on a visit to New Delhi, was taken on the customary pilgrimage to Jinnah's magnificent bungalow at 10, Aurangzeb Road, where many an historic decision was taken. There, standing at the junction of Janpath and Aurangzeb Road, he burst out: "See! Even Quaid-i-Azam liked corner plots." ■

A quantum leap in remote-sensing

The advent of IKONOS, a remote-sensing U.S. satellite that can take one-metre resolution images, could affect India's supremacy in the commercial imaging data market.

R. RAMACHANDRAN



THE supremacy enjoyed by the high-resolution imagery of the Indian Remote Sensing satellites IRS-1C and IRS-1D in the world market in civilian earth observation data ended on October 12 when the first images from IKONOS, a remote-sensing satellite launched by the United States company Space Imaging, made their appearance. As compared to the 5.8-metre resolution of IRS (panchromatic or black and white) images, IKONOS (panchromatic) images have a resolution of one metre, a capability hitherto restricted to military reconnaissance satellites. Similarly, in the multispectral (or coloured, including near infra-red) images too, IKONOS' resolution capability of 4 m greatly surpasses the IRS' 23 m.

In commercial or business terms, it may even seem a bit ironical that the exclusive marketing rights for IRS images and other data products outside India rest with Space Imaging. It is a five-year-old company based in Denver, Colorado, dealing in space imagery, aerial photography, mapping services, and so on, with which the Indian Space Research Organisation (ISRO) entered into a 10-year commercial contract on February 2, 1995, although it knew well that the company would very soon be its competitor in the high-resolution imagery market. "The agreement is indeed incomprehensible because you are selling away your advantage and at the same time losing your market share," a leading space analyst had said then.

According to the U.S. market survey agency Frost & Sullivan, the revenue in 1998 from the commercial imaging data was around $139 million. This, according to the agency, is expected to grow at the rate of 17 per cent through 2005, with the figure being around $420 million in 2005. The figures for IRS data sales abroad in the last financial year was a mere Rs. 276 lakhs. (Actually, this would include the lump sum paid to ISRO for the setting up of new IRS earth stations, besides 10 per cent royalty on data sales). Assuming that the entire amount is from royalties, the market share is just about 5 per cent. Now that IKONOS is in place (and several others with similar high-resolution capability are planned), the IRS' market share could shrink further. It would seem that Space Imaging has used IRS' data to create a user base of high-resolution images which it can now easily target with its own IKONOS data.

It is true, as ISRO officials say, that not all applications would require one-metre resolution data and it is unlikely that users of IRS data would shift to IKONOS data except for some specific applications. Moreover, the one-metre resolution data would be very expensive, they point out. However, when one-metre resolution data abounds – which will be when other satellites too go into orbit – prices are bound to come down, and ISRO's next IRS satellite, Cartosat, slated for launch in 2000, is designed to produce only 2.5-m resolution images. When IRS 1C/1D were in orbit, the time was ripe to exploit the market's unmet demand for high-resolution data on account of the failure of the U.S. satellite Landsat 6 in 1993 and the delay in the launch of the French SPOT 4. But without its own effective marketing arm, ISRO chose to rely on Earth Observation Satellite Company (EOSAT)/Space Imaging, which has not really generated a market share commensurate with the quality of IRS data.

According to Dr. K. Kasturirangan, Chairman, ISRO, this was mainly because, one, it took time for customers to become aware of the quality of IRS data and, two, having set up receiving stations for Landsat/SPOT data, it was not easy for countries to set up stations for IRS data as well. This was happening now only with stations coming up in Korea, Japan, Saudi Arabia, the U.S. (Alaska) and Ecuador. But events seem to be overtaking ISRO's efforts at making inroads into the world market and the first signs of that are Space Imaging's IKONOS. How big the emerging market is going to be is unknown but the fact that companies like Space Imaging, Earth Watch and OrbImage (which are planning one-metre resolution satellites) were able to raise a total of over $500 million over the past few years, suggests that investors see substantial growth even in this specialised segment of remote-sensed data.

RUSS UNDERWOOD LOCKHEED MARTIN/COMMERCIAL SPACE SYSTEMS

The IKONOS satellite is the world's first and only commercial satellite to have made one-metre resolution images of specific areas of the earth.

SPACE IMAGING happens to be the first commercial remote-sensing organisation to launch its own satellite. It was founded in 1994 following the merger of EOSAT with Lockheed Martin. Besides marketing IRS data, Space Imaging also collects and disseminates data from Landsat, Canada's

Radarsat and the European Space Agency's ERS satellites. It also distributes the archived imagery of the Japanese JERS imaging system. The Clinton administration's March 1994 policy on deregulation of remote-sensing data and technologies enabled Space Imaging to apply for a licence to launch a one-metre resolution satellite. Once it procured the licence, it soon found new investors, such as Mitsubishi and Raytheon. This ensured that technologies required for launching IKONOS on its own were in its control.

SPACE IMAGING

A one-metre resolution black-and-white image of a spot in Washington D.C. made by IKONOS. It shows landmarks, including the Washington Monument and the Smithsonian Institution's American History Museum.

While the actual commercial sale and dissemination of one-metre resolution images are likely to commence sometime towards the end of 1999, the publicity image of Washington D.C., which was released on October 12, is indeed remarkable for the unprecedented details that can be discerned in a commercial imagery. For example, one can even make out vehicles on the roads and the windows of buildings. The sharpness is almost close to an image from an aircraft-borne camera. This image was taken on September 30, six days after IKONOS' launch aboard the Athena II launcher.

IKONOS was to be launched on April 27, 1999, but the launch (of IKONOS I) was unsuccessful because of a launch anomaly which resulted in loss of communication with the satellite. An investigation into the failed launch is currently on. The satellite (IKONOS II) that is currently beaming pictures was to have been launched next year but was readied in advance as a back-up satellite in the eventuality of a failed launch.

While the quality of the image is clearly indicative of the imaging capabilities of the satellite systems, particularly the optical imaging camera manufactured by Kodak, which is supposed to have 35 years of experience in building remote-sensing systems, it also shows that the satellite is in perfect working condition. The company has claimed that the sharpness of Kodak's telescoping device has never been achieved in any commercial satellite till date. In fact, this particular publicity image has apparently not even been processed to "map quality", according to Jeff Harris, the company's president. So the quality of processed images and value-added ones can be imagined. Space Imaging has already begun to accept orders for images, which will be marketed under the company's brand name CARTERRA.

THE name IKONOS is derived from the Greek word for "image" and the satellite, like the IRS satellites or any other earth observation satellite, is a sun-synchronous satellite, which passes over a given region of the earth at the same time of the day. The satellite weighs about 720 kg and its orbit is a near-polar circular one at a height of about 680 km. It orbits the earth once every 98 minutes; that is, it makes 14 orbits a day. Lockheed Martin was the prime contractor for the IKONOS satellite and the satellite was launched aboard its launcher Athena II. Raytheon built the communications and image-processing systems for the spacecraft; Kodak designed and built the customised camera for generating one-metre resolution images between 1995 and 1997.

One-metre resolution implies that the images can tell apart objects with dimensions of one metre and above. This means that cars and trucks, roads, pipelines, individual houses, large equipment, ships and boats, airplanes and so on can be distinguished and identified. Apart from the use of such high-resolution imagery in applications of national security, they have important civilian applications as well – in agriculture, cadastral surveys, forestry, planning, mapping urban areas for building and road construction and other such infrastructural activities, oil and gas utilities, emergency responses during disasters, telecommunications, transportation and so on. A revisit capability (that is, periodicity of imaging the same spot on the earth) of once every two or three days (as against every five days of IRS) enables quick updates of images needed for certain applications like agriculture, pollution monitoring, risk evaluation and disaster management.

Indeed, there may be a demand for such data even from India, particularly for high-resolution mapping, Geographical Information System (GIS) software-based planning, implementation of developmental projects and for early crop monitoring against pest attacks or diseases based on IR data. Even the National Remote Sensing Agency (NRSA) plans to use these to generate 1:5,000 scale maps of regions of India, which would be of a much larger scale than the 1:25,000 scale map that the Survey of India (SOI) distributes. According to Dr. D.P. Rao, Director, NRSA, maps with an absolute coordinate accuracy of 5 metres can be produced using data refining accuracies, as compared to a 20-metre accuracy using IRS data. There is, however, no clear-cut policy in India on the dissemination of such high-resolution data as of now.

The U.S., notwithstanding its capability in spy satellites (the Key Hole series of satellites), had not entered the commercial high-resolution imagery market until now. This was essentially because of domestic policies which, on grounds of national security, denied foreign parties access to high-resolution data, had restricted commercial distribution of images (of higher than 10-m resolution)

and relevant technologies. But with the advent of SPOT data in the mid-1980s, with 10-m resolution in the commercial arena and subsequent entry of the Soviet Union with 5-m resolution and later Russia with 2-m resolution images from the KVR-1000 camera altered the scene. Soon enough, in 1995, India too became a player in the high-resolution imagery market, with its 5.8-m data.

In March 1994, President Bill Clinton deregulated remote-sensing technologies and data – however, with several attendant conditions that ensured government control in the matter of sale and distribution of high-resolution imagery – so as to retain the technological superiority of U.S. remote-sensing in the commercial market. This did not really compromise on actual reconnaissance capabilities of the U.S. because that is in the region of 10-100-cm resolution. This allowed many U.S. companies to plan remote-sensing satellite programmes and bid for licences to launch satellites. By 1997, 11 companies had been granted licences and satellite plans of nine of them were already approved. IKONOS is the first to be launched. It will soon be followed by other one-metre resolution satellites, OrbView-3 and QuickBird.

Future high resolution remote-sensing satellites

Satellite	Source	Launch	Type	Resolution (m)
EROS-A1	West Indian Space Ltd.	1999	Panchromatic	1.5
QuickBird	Earth Watch, U.S.	1999	Multispectral	3.2
			Panchromatic	0.82
OrbView-3	Orbimage, U.S.	1999	Multispectral	4
			Panchromatic	1-2
IRS-P5 (Cartosat)	India	2000	Panchromatic	2.5
SPIN-2**	Russia	1999-2000 (various)	Panchromatic photography	2
LightSAR	U.S.	2000	SAR Radar	3-100
OrbView-4	Orbimage, U.S.	2000	Panchromatic	1
			Multispectral	4
			Hyperspectral	8
EROS-A2	West Indian Space Ltd.	2000	Panchromatic	1.5
EROS-B1	West Indian Space Ltd.	2001	Panchromatic	0.82
ALOS	Japan	2003	VSAR Radar	10
			Multispectral	10
			Panchromatic	2.5

** Russia has been continously operating SPIN-2 series of satellites producing remote-sensed images of 2-m resolution with its KVR-1000 panchromatic camera and marketing them as well from 1990 onwards. It just happens that at this point of time there is no SPIN-2 satellite in orbit.

While the accent of these high-resolution imaging satellites is on civilian applications – and indeed the demand of high-resolution images for these is projected to grow rapidly – the resolution is of military significance. In that situation, the dividing line between a commercial satellite and a military satellite becomes thin and high-resolution data become dual-use capable. Vipin Gupta, a remote-sensing specialist with the U.S. Sandia National Laboratories, who has used commercial remote-sensed data to monitor weapons proliferation activities as well as developments during the Gulf War, says: "In the short term, make no mistake, they are marketing for defence and intelligence applications."

Indeed, it is well known from the work of people like Bhupendra Jasani, a remote-sensing analyst based in the United Kingdom who has done extensive work on monitoring nuclear activities around the world using satellite images, that a great deal of intelligence activity can be carried out using commercial satellite imagery supplemented with other intelligence data. From this perspective, Gupta's remarks do make sense because most civilian applications do not require one-metre resolution data and a business cannot be sustained by a few specialised uses of these data. The sales volume has to come from regular purchases by countries which have adversary relations with their neighbours and are under constant threat of attack but with no access to superior space-based reconnaissance technologies. (Interestingly, the U.S. Government has committed itself to buying over the next five years $1 billion worth of high-resolution data from the licencees.)

India and Pakistan form a classic case. According to a recent newspaper report (*Indian Express*, September 27), the Defence Image Processing and Analysis Centre (DIPAC), the secret outfit of the armed services that does analysis of reconnaissance and satellite imagery, told the Subrahmanyam Committee (set up to examine the factors that led to the Kargil War) that India's satellite imagery (with 5.8-m resolution) was insufficient to provide tactical information. The Centre is reported to have said that synthetic aperture radars (SARs), unmanned aerial vehicles and a constellation of imaging satellites would be required to gather tactical information.

This actually points to DIPAC's incompetence at one level: with intelligent, careful and continuous analysis of 5.8-m resolution data, a great deal of information can be gathered. Also, it is known that India does purchase 2-m data from Russia. This should certainly suffice for the purpose. Notwithstanding these observations, the availability of one-metre resolution data is likely to be welcomed by intelligence forces on both sides of the border. Whether access to such data on a real-time basis could ease tension or escalate it is another matter. One could argue both ways.

But there is also a catch here. IKONOS does not have complete freedom to distribute all its data. There are eight restrictions with regard to the sale of high-resolution data in Clinton's 1994 policy. These restrictions, which have come to be called "shutter control", give total authority to the U.S. Government to prevent the sale of images or even the imaging of a certain region by U.S. commercial satellites for foreign policy and national security considerations. In fact, there is a separate policy that forbids imaging Israel. It is, therefore, not unimaginable that the U.S. Government may put a ban on data over India and Pakistan if in its perception it is not in the interests of the two countries to gain access to high-resolution data. Indeed, diplomatic moves have been afoot to get other countries with high-resolution remote-sensing capabilities, like Canada and Russia, to follow its policies. Canada has reportedly agreed but Russia has not.

In any case, commercial remote-sensing is likely to undergo a radical change once IKONOS images become available openly, notwithstanding their cost. However, given its security implications, it is perhaps necessary for the United Nations Committee for Peaceful Uses of Outer Space (COPUOS) to review its policies on remote-sensed data, formulated 13 years ago. It must, however, be remembered that its efforts all through the 1980s to put a cap on the resolution of commercially marketed remote-sensed images never succeeded. But one-metre resolution imagery is almost as good as airborne imagery and that would perhaps make nations and governments uneasy. But very soon one would know whether one-metre resolution is a bane or a boon.

Microsoft, the monopolist

In findings of fact that precede a final verdict following a year-long trial in the U.S. government's anti-trust case against Microsoft, a Judge concludes that the software maker is a monopolist that time and again bullied other companies in the industry, harming consumers and hindering innovation.

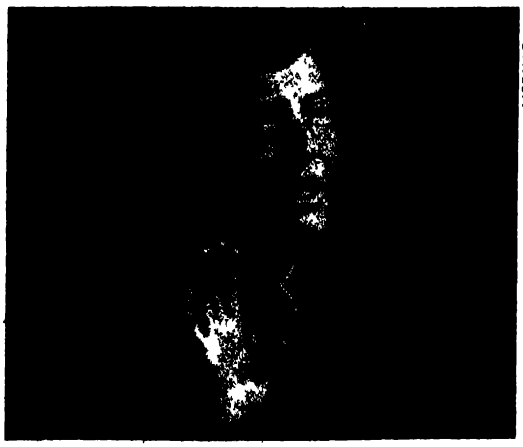
JOEL BRINKLEY

ON November 6, in the U.S. government's anti-trust trial against the Microsoft Corporation, a Judge issued a broad denunciation of the software giant as the first part of his verdict in the landmark case.

The Judge, Thomas Penfield Jackson of Federal District Court, Washington, said the company had used its monopoly power to stifle innovation, reduce competition and hurt consumers.

"Most harmful of all is the message that Microsoft's actions have conveyed to every enterprise with the potential to innovate in the computer industry," Judge Jackson wrote in his 207-page findings of fact.

"Through its conduct," he added, "Microsoft has demonstrated that it will use its prodigious market power and immense profits to harm any firm that insists on pursuing initiatives that could intensify competition against one of Microsoft's core products." The Judge's findings of fact are not a final verdict but a declaration of which side's version of events he believes. They clearly show that he found the government's case against Microsoft credible and rejected as "specious", as he stated in one part, virtually all the arguments Microsoft put up in its defence. The findings are the judge's conclusions about who presented the most compelling and believable case during the year-long trial that opened in his United States district courtroom on October 19, 1998. As such, they clearly signal how he will rule in his eventual verdict.



Microsoft and the government both reacted quickly after receiving the much-anticipated findings. The judge, who in years past wrote his decisions long-hand, transmitted the document to both sides by e-mail. It was made public at 6-30 p.m., after the stock markets had closed.

The Justice Department was jubilant. "This is a great day for American consumers," Attorney-General Janet Reno said. "This case is about the protection of innovation, competition and the consumers' right to choose the products they want." Microsoft, on the other hand, quickly issued a statement indicating that the company was already formulating its appeal.

"While we disagree with many of the findings," the statement said, "we are still confident that the law supports us on these points and that the American legal system will ultimately rule that Microsoft's actions were fair, legal and good for consumers."

Later, Microsoft's chairman, William H. Gates, said: "We respectfully disagree with the court's findings. Microsoft competes vigorously and fairly. Microsoft is committed to resolving this case in a fair and equitable manner." He added that his company "operates within the laws and operates in a way that is great for the people we develop software for."

Neither in Microsoft's statements nor those of the Justice Department was there much talk of settling the case. Joel I. Klein, head of the Justice Department's anti-trust division, said the government would consider a settlement, but only one that "fully and properly addresses" the issues raised in the judge's findings.

MCFALLS

At a press conference in Washington, Microsoft Chairman Bill Gates responds to the findings of fact in the anti-trust trial.

Although the Judge's findings of fact are virtually impervious to appeal, Microsoft's leaders are expected to seek grounds for appeal, should Judge Jackson eventually rule against them. Under federal court rules, appeals courts must give great weight to the conclusions the trial judge draws from hearing the testimony and studying the witnesses as they offer their accounts. As a result, appeals courts are allowed to challenge findings of fact only if they are "clearly erroneous". And if the Judge's verdict is largely based on which witnesses he believed, the verdict stands a better chance of withstanding appeal.

At the outset of his findings, the Judge declared that Microsoft "enjoys monopoly power in the relevant market". This is a key assertion because under anti-trust laws monopolies cannot engage in practices that would be legal for other companies. The government's charges rested on the assumption that Microsoft has a monopoly in the operating systems market with its Windows operating systems.

In a key test for monopoly power, the Judge concluded that Microsoft could charge whatever it wanted for Windows without fear that price increases would reduce demand.

Microsoft expended considerable energy in court arguing that it was not a monopoly. It asserted that a host of small competitors– from the Be operating system to Palm Pilot personal organisers – were long-term threats. But the Judge dismissed those arguments, saying that competition from those competitors was, at the very least, a long way off. "Microsoft's monopoly power," he concluded, "is also evidenced by the fact that, over the course of several years, Microsoft took actions that only could have been advantageous

if they operated to reinforce monopoly power" From there, the Judge ran through each of the charges raised by the Justice Department and the 19 State Attorneys-General who joined in the suit In each case he endorsed the government's charge while rejecting Microsoft's rebuttals He found that Microsoft had tried to divide the market for Internet browsing software with the Netscape Communications Corporation in 1995 – a key charge in the government's case and a clearly illegal activity under anti-trust law He wrote that other companies had had similar encounters with Microsoft, and these interactions demonstrate that it is Microsoft's corporate practice to pressure other firms to halt software development that threatens Microsoft's dominance "or competes directly with Microsoft's most cherished software products"

He found that Microsoft's decision to bundle its Web browser with Windows and give it away free was not, as Microsoft asserted in court, simply an effort to add a desirable feature to Windows "Senior executives at Microsoft decided Microsoft needed to give its browser away in furtherance of the larger strategic goal of gaining market share," he wrote Microsoft, he added, 'viewed browser market share as the key to preserving its dominance" And in one of his most damning findings, Judge Jackson concluded that "Web browsers and operating systems are separate products' Microsoft's key argument was that its browser was simply a feature of Windows, not a separate product The Judge turned that argument around on Microsoft by finding that the company had actually harmed consumers by bundling the two products Consumer harm is a key test in antitrust cases Bundling the browser with Windows 'unjustifiably jeopardised the stability and security of the operating system , meaning that he believed the government's argument that including the browser had made the operating system more likely to crash and more vulnerable to break-ins by intruders "There is no technical justification for Microsoft's refusal to meet consumer demand for a browserless version of Windows 98," he added The Judge wrote that Microsoft had threatened and bullied Apple Computer, Intel, America Online and other companies that Microsoft perceived as competitors In the case of the International Business Machines Corporation, he wrote, "when IBM refused to abate the promotion of those of its own products that competed with Windows and Office," Microsoft's suite of business productivity software, "Microsoft punished the IBM PC Company with higher prices, a late licence for Windows 95 and the withholding of technical and marketing support"

The Judge concluded "Microsoft's past success in hurting such companies and stifling innovation deters investment in technologies and businesses that exhibit the potential to threaten Microsoft The ultimate result is that some innovations that would truly benefit consumers never occur for the sole reason that they do not coincide with Microsoft's self interest"

Anti-trust lawyers say they cannot recall another instance in which findings of fact in an anti-trust case have been issued ahead of the actual verdict Usually the findings are packaged with the conclusions of law – the legal precedents justifying a ruling – and the verdict But Judge Jackson's decision to separate the findings offers at last two benefits "It's potentially a very clever thing to do," said Robert Litan, a former senior official in the Justice Department's anti-trust division For one thing, it will allow Judge Jackson to modify his final ruling if written responses from the litigants suggest to him that he might be standing on weak ground

Publishing the findings ahead of the verdict also "prompts the parties to try to settle," said Andrew Gavil, a Professor of Law at Howard University "This is a lot brighter than tea leaves It tells the parties exactly where they stand" Judge Jackson has repeatedly urged Microsoft and the government to settle the case.

A Microsoft lawyer said that Microsoft's leaders stand willing to discuss a settlement Nevertheless, he said, they remain unified in their conviction that they will not accept any settlement that would jeopardise "our core value, the soul of our company, and that is the freedom to innovate and design products as we see fit." ■

New York Times Service

No room for ambiguity

STEVE LOHR

"IT'S a bad day for Microsoft," observed William Kovacic, a Professor at the George Washington University law school "The Judge relentlessly accepted the government's story of what happened."

Before the findings of fact were released, legal experts had expected that Judge Jackson would generally favour the government but also nod on occasion in Microsoft's direction. He had suggested in the past that he would prefer to broker an out-of-court settlement between Microsoft and the government. Such an outcome would relieve the federal courts of the burden of having to make fine-tuned decisions about products and business practices in the Internet economy.

A settlement is still a possibility – but only, it seems, if Gates and his top lieutenants decide that Judge Jackson has done what no [illegible] competitor ever accomplished: [illegible] Microsoft to its knee...

[illegible] with these findings, anti-trust [illegible] say it is more likely that [illegible] Microsoft will persevere, hoping that [illegible] Jackson's final ruling is not [illegible] a one-sided rout as the judgment might seem to portend. The company's next step might then be to appeal his decision to a federal appeals court and then perhaps the Supreme Court.

"If the Judge's goal was settlement, he would have to leave enough ambiguity in the findings of fact so that neither side sees it as in its self-interest to fight this to the bitter end," observed Herbert Hovenkamp, a Professor at the University of Iowa law school, who is a leading antitrust scholar and is advising the government.

There seems little that is ambiguous in Judge Jackson's document. "Having gone this far, I don't see Microsoft settling," said Andrew Gavil, a Professor at the Howard University law school.

The Judge's findings of fact are preliminary step, but they form the foundation and framework for the outcome of the case – either a legal judgment or a settlement. A court's legal judgment can be routinely overruled by a higher court on appeal. But findings of fact can be overturned only in the rare instance when the higher court finds a "blatant contradiction" between the witness' record of testimony and a judge's finding. ■

The Pope in India

In Delhi, Pope John Paul II reaffirms the Church's commitment to enter "ever more deeply" into dialogue with the other religions of the world.

V. VENKATESAN
in New Delhi

THE four-day visit of Pope John Paul II, the head of the Roman Catholic Church and of the Vatican City State, to New Delhi in the first week of November evoked keen interest among people of all religions and brought special cheer to India's Christian community. The Pope flew in on the evening of November 5 amidst tight security. He was given a simple official reception at the airport.

The 79-year-old pontiff, who is a head of state, stayed at the Holy See Apostolic Nunciature on Shanti Path in New Delhi's diplomatic enclave.

On the morning of November 6, the Pope was accorded an official reception in the forecourt of Rashtrapati Bhavan. He met President K.R. Narayanan at Rashtrapati Bhavan and Vice-President Krishan Kant and Prime Minister Atal Behari Vajpayee at Hyderabad House. A press note issued by the Catholic Archdiocese of Delhi, which organised the visit, described the meetings as cordial. The three leaders showed great respect for the Pope, it said.

During his meeting with the Pope, the President emphasised that the freedom of religion was the cornerstone of Indian democracy and that it was paramount despite the rise of late of some intolerant fringe groups. He recalled the Pope's earlier visit to India in 1986 and appreciated his call for friendly relations among peoples in his message for the third millennium. They spoke about Mother Teresa.

Vajpayee thanked the Pope for being in India on the happy occasion of Deepavali, the festival of lights which signifies the victory of good over evil. He observed that perhaps the papal visit added more light to the festival. Vajpayee underlined the fact that India is a multi-religious, multi-ethnic and multi-lingual nation that accords paramount importance to peace and cooperation.

Krishan Kant told the Pope that India would remain a haven for all religions because it believed that nation and religion are not synonymous.

As part of his official engagements, the Pope laid a wreath, one made up of yellow roses and carnations, at the samadhi of Mahatma Gandhi at Rajghat. He inscribed in the guest book a quote from the Mahatma – "A culture cannot survive if it attempts to be exclusive" – and signed Johnnes Paulus II

V SUDERSHAN

THE Pope's religious engagements began with a meeting with the bishops of the Asia Synod and the promulgation of the Asian Synod Document, "Ecclesia in Asia" (Church in Asia), at the Sacred Heart Cathedral in New Delhi on the evening of November 6. The Asian Synod is the special assembly of the bishops of Asia.

The Asian Synod was convened in the Vatican from April 19 to May 14, 1998. It concluded on November 6, 1999 in New Delhi, when the Pope signed and issued an "Apostolic Exhortation" incorporating the recommendations of the bishops of the synod. Two hundred and fifty-two Church leaders attended the Asian Synod. The Indian delegation, the largest in terms of size, comprised 24 members. The second largest was the 20-member delegation from the Philippines. Also invited were three prelates from China (a cardinal, a bishop, and a coadjutor bishop); they, however, did not attend.

The 140-page document released by the Pope – "Post-Synod Apostolic Exhortation of the Holy Father"– analyses the social, political, cultural, developmental and moral

landscape at the turn of the millennium and charts the course for the Church. It calls upon the Church to proclaim the "Good News"(the message of Jesus Christ) "with loving respect and esteem". This is mischievously interpreted by the Church's critics as a call for conversions to Christianity.

V. SUDERSHAN

THE four-hour Holy Mass held at the Jawaharlal Nehru Stadium on November 7 to mark the conclusion of the Special Assembly of Asian Synod of Bishops, was considerably Indianised. The special altar, shaped like hands raised in prayer, was flanked by a portrait of Mother Teresa, drawn by a young artist, Adarsh Alphons, to the left and the Gospel to the right. A huge Indian brass lamp stood in the foreground, while bright *diyas* (earthern lamps) painted on the rising stage decorated the terraced sanctuary. A group of tribal men and women from Ranchi danced to folk tunes as they ushered in the procession of priests and bishops. Bishops of the Oriental rites lent a special colour to the solemn ranks of the clergy. Other Indian characteristics included the singing of a Tamil devotional song and an *aarti* ceremony.

Handing over the post-synodal document, the Pope hoped for a great harvest of Christian faith in Asia and bestowed the message of love and hope on the people of this continent. About 70,000 people thronged the stadium.

The Pope made a slow round of the stadium in his Popemobile, waving and

At a ceremonial reception at Rashtrapati Bhavan, President K.R. Narayanan and Prime Minister A.B. Vajpayee with the Pope. (Facing page) Congress(I) president Sonia Gandhi greets the Pope.

Notes on the fringe

V. VENKATESAN

THE Pope's visit to India was preceded by long-drawn, high-pitched campaigns by Hindu fundamentalists and Christian groups, albeit with different objectives.

A rath yatra from Goa, organised by the Sanskriti Raksha Manch (SRM), a Sangh Parivar organisation, reached Delhi on the morning of November 4. The rath, a converted van, was festooned with banners decrying Christianity and the alleged conversion of Hindus by Christian missionaries. "Ham [illegible] *Ram ko lana hai*" (We want Ram, we want [illegible]) declared one banner. The yatris dispersed after holding a public meeting at which they decried "forcible conversions".

The SRM held another public meeting the same afternoon near the Ram Lila ground at Kasturba Nagar. Vishwa Hindu Parishad (VHP) and SRM leaders addressed the small gathering of people who did not seem to have much idea of the issues that were raised by the speakers, including VHP leader Ashok Singhal, Dharmendra [illegible] Parliament [illegible] Singh.

claimed that the papal bull issued on May 4, 1593 by the then Pope to the King of Portugal regarding conversions was still valid. He claimed that it was only after the bull had been issued that [illegible] against Hindus occurred in Portuguese-ruled Goa.

V SUDERSHAN

smiling, instantly inviting hand-clapping, which did not stop for several minutes People burst into the rousing musical score of "God Bless our Pope! The Great, the Good" The Pope ascended the stage on an electrically operated platform, which was shielded by a huge banner to protect him from sunlight

After the Mass, the Pope administered the Holy Communion to 30 chosen people, who included the orphaned, the physically handicapped and the terminally ill The Pope also gave Holy Communion to a group of people representing a cross-section of Asian Catholics Among them was a 76-year-old woman, Moksha Pakiam, who had come from Bangalore At the end of the Holy Mass, the Pope held up his hand and said *"Bharat ko aashirwad, shanti!* God bless all "

The Pope, in his Homily, said that it was fitting that this document had been signed and issued in India, the home of many of Asia's time-honoured cultures, religions and spiritual traditions More than 300 bishops and 1,000 priests celebrated the Mass with the Pope

The Pope, an admirer of Mother Teresa, made a special reference to her "She loved India, She is with the people of India forever," he said He appealed to the Church not to forget her witness of evangelical love, specially towards the poorest of the poor

On the evening of November 7, the Pope participated in an inter-religious leaders' meeting, organised at Vigyan Bhavan by the Inter-Ritual Committee of the Catholic Bishops' Conference of India and its sister organisations Those who welcomed the Pope included Shankaracharya Madhavananda Saraswati of Prayagpeeth, Dr Mufti Mohammed Mukkarram Ahmed, Bhai Manjit Singh Sahib, Acharya Mahaprajna, K Rajaratnam, Samdhong Rinpoche, Ervad Cawas Daraius Bagli, Ezekiel Isaac Malekar and Zena Sorabjee

No dialogue took place at the meeting, but the Pope reaffirmed the Church's commitment to enter "ever more deeply" into dialogue with the religions of the world The Church sees this dialogue as an act of love which has its roots in God himself He clarified however, that "dialogue is never an attempt to impose our own views upon others, since such dialogue would become a form of spiritual and cultural domination" He explained "Holding firmly to what we believe, we listen respectfully to others "

Giving credit to Indian historical figures such as Ashoka, Akbar, Shivaji, Ramakrishna Paramahamsa, Vivekananda, Mahatma Gandhi, Rabindranath Tagore, and Dr S Radhakrishnan, the Pope underlined the importance of universal brotherhood and religious freedom, which he said, constituted 'the very heart of human rights' He emphasised that individuals must be recognised as having the right to change their religion, if their conscience so demanded – obliquely referring to the protests from Hindu fundamentalist groups against conversions to Christianity

The Pope held a Private Holy Mass in the chapel of the Vatican Embassy on the morning of November 8 He left for Georgia later ■

requests from some quarters of the BJP.

tions). It pointed out that Christian missionaries run nearly 15,000 educational institutions in the country, besides more than 7,000 social welfare institutions. The CBCI claimed that these funds helped raise only a [illegible] expenses required to run these institutions.

sought to ensure foolproof security arrangements by making preventive arrests, including that of the Shiv Sena's local office-bearers. Despite this, three Shiv Sainiks attempted to stage a protest at Rajghat's main gate even as the Pope was paying homage to Mahatma Gandhi. They were rounded up by the police.

There were no other untoward incidents. The All India Christian Council said that despite the protests that preceded it, the Pope's visit went off well. It stated that the Pope had received a positive response from the people and the government. A spokesperson for the Council said that following the visit, dialogue and understanding at a new level had been put in place. ■

An activist Pope

JOHN CHERIAN

POPE JOHN PAUL II is an inveterate traveller. Although in frail health for the past several years, the pontiff has been keen to visit as many countries as possible. And he is not a man to shirk controversy, as his second visit to India showed. His visit to Cuba had come under strong criticism from influential sections of the Clinton administration and conservative groups in the United States.

Pope John Paul II has also been one of the most activist Popes of the millennium. His conservative agenda on social issues was evident from the very outset of his papacy. The accommodative worldview of his two immediate predecessors was noticeably absent in his initial statements and actions.

The campaign launched by John Paul II against the socialist countries of Eastern Europe contributed a great deal to the demise of the Eastern bloc. He was the inspiration for the Solidarity trade union movement, which eventually came to power in Poland. His overt and covert role in bringing about the downfall of the socialist government in Poland, his home country, is acknowledged today by the West.

The same Pope said in the late 1990s that the collapse of socialism was not entirely a good development and that unfettered capitalism had led to further deprivation for the poor of the world. In his encyclical, "Advent of the Third Millennium", the Pope made an impassioned plea to the international community to raise its voice for a substantial, if not an outright, cancellation of the international debt owed by poor nations to the developed world.

The Pope also took a tough stance against the proponents of Liberation Theology within the Catholic Church, who had sided with the peasants and the working class in Latin American and other Third World countries in their struggle against exploitation and authoritarian rule. The Pope's undisguised hostility towards the Sandinistas, who came to power in Nicaragua with considerable help from the radical sections of the Catholic Church, is an illustration.

[illegible] casting a shadow of [illegible] [illegible]

Radical priests and theologians have, on many occasions, been defrocked or sidelined because of their solidarity with the oppressed. This happened mostly in the 1970s and the 1980s when Latin America was in ferment.

After the end of the Cold War, the Pope mellowed considerably. In recent times the Vatican has been very critical of the U.S.-sponsored sanctions against countries such as Iraq and Cuba. The Pope, in fact, will be visiting Iraq before the year-end, much to the consternation of the Clinton administration.

UNLIKE the Pope's earlier visit to India in 1986, the shorter visit this time was clouded by controversy orchestrated by a tiny minority. In the last year and a half, Christian-bashing has become popular in many parts of India. Sections of the Sangh Parivar have been trying to equate Christianity with conversion. The campaign against churches and foreign missionaries in the tribal areas of Gujarat, Madhya Pradesh and Orissa seems to have brought the Bharatiya Janata Party temporary political dividends in the form of parliamentary seats.

Fundamentalist Christian groupings, mainly the U.S.-based ones, added fuel to the fire by issuing incendiary statements on the issue of conversions in India. The killing of Christian missionaries only fuelled their messianic zeal.

Hindu fundamentalist groups [illegible] joined in the Pope's visit and [illegible] threatened to disrupt the Pope's schedule in New Delhi. But a more [illegible] sense prevailed, with the Government taking a tough stance against them.

However, the best-handled way in which the Government initially [illegible] has left a bad taste. The Government saw it fit to convey to the Vatican only a week before the Pope's arrival that Vice-President Krishan Kant would not attend the inter-religious meeting that was to be held in Delhi on the last day of the visit. The reason given officially was that it was not in the fitness of things that the Vice-President of a secular republic participate in what was essentially a religious meet. Precedents and the fact that the Pope has the diplomatic status of a head of state were conveniently forgotten. Another reason being trotted out by officials is that the Dalai Lama could have attended the all-religion meet and this would have been embarrassing for the Indian Government.

Otherwise, the Pope was accorded all diplomatic courtesies. He met President K.R. Narayanan, Krishan Kant and Prime Minister Atal Behari Vajpayee. According to a press release issued by the Information Bureau of the Catholic Archdiocese of Delhi, the "climate of the meetings was cordial and the three Indian leaders showed great respect for the Pope".

The President recalled the Pope's first visit to India in 1986. Both the President and the Pope remembered Mother Teresa. Narayanan nostalgically recalled

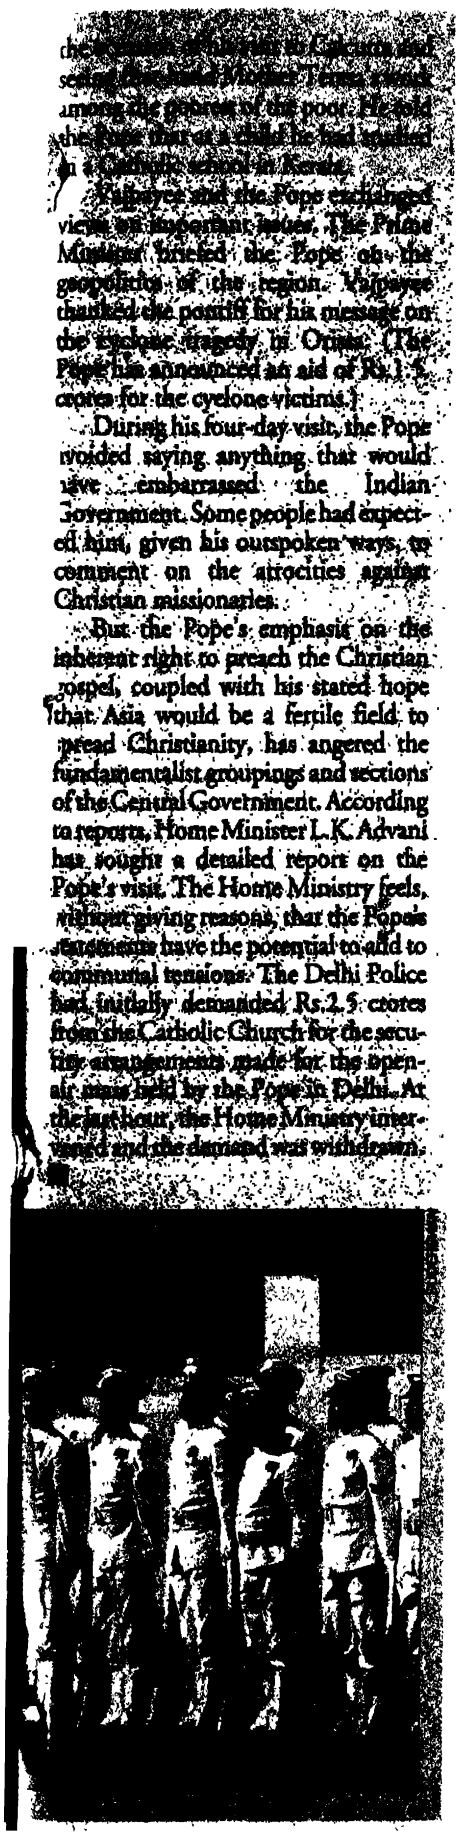
A manifestation of social reaction

The Vishwa Hindu Parishad's challenge to Pope John Paul II's visit is a case of social reaction rising up in opposition to conservatism.

SUKUMAR MURALIDHARAN
in New Delhi

THE visit of the Roman Catholic pontiff to India was an occasion for the saffron brotherhood to assert its claim to prominence as the principal vehicle for the articulation of an entire religious community's aspirations. But the propagandist effort to drum up a modicum of popular endorsement simply failed to get off the ground. As the extremist fringe rapidly faded away from public attention, a new strain of moderate mendicancy in the service of Hindutva came to the fore.

The run-up to the papal visit saw a proliferation of bodies constituted with the specific charter of defending the Hindu faith. Among them was the Dharma Rakshana Sammelan, which managed to recruit a number of individuals of middling eminence to its cause, to endorse a statement decrying the "evangelisation of Asia". That this body managed to put out a number of advertisements in prime spots in the national print media pointed to a high level of motivation and financial sustenance from quarters yet unknown.



The Dharma Rakshana Sammelan may not have matched the crudity of the Vishwa Hindu Parishad's Giriraj Kishore, who denounced the Pope's arrival in India as something akin to a burglar's forced entry. But its hand-wringing expressions of anguish at continuing religious conversions under the aegis of the Church certainly did not seem any better conceived. Religious conversion, it argued, "is violence, pure and simple, particularly against the Hindu faith, which does not believe in conversion".

As a claim, this is quite remote from reality. The VHP, which it may be safely assumed, is the principal sponsor of the media advertisement which greeted the Pope in India, proudly declares its numerical achievements in conversions (or re-conversions as it is called, since every faith practised in India is considered alien to the original Hindu identity) in its annual publications. Further, religion is a personal choice and it is for those levelling the charge of violence to prove the fact of coercion or some form of illicit allurement to make it stick. Rather than the axiomatic violence of conversion, what is today evident is the surpassing brutality of the VHP's campaign to check the activities of Christian missionaries in India.

The right to practise, preach and propagate one's religion is guaranteed by the Constitution. There has been a ruling by the Supreme Court that conversions go beyond any legitimate construal of the term "propagation". But this is an ambiguous ruling. If restraints are to be imposed on these activities – whether of a legal or purely administrative nature – then the principle of symmetric treatment would necessitate similar curbs on the activities of the various godmen, spiritual healers and mystics that the country abounds in. Such powers, if institutionalised, could conceivably lead to a massive assault on fundamental freedoms.

Further, if there are grounds for legitimate grievances at the activities of Christian preachers, redress is available through legal processes. The Indian Penal Code has fairly strong provisions to deal with cases of offence to religious sentiments. Neither the VHP nor any of its affiliates will even consider this recourse for reasons which are fairly transparent – if the provisions of law are invoked against a minority community, there is equal if not greater reason to use them against the majority.

ANOTHER of the Sammelan's claims, about Mahatma Gandhi's opposition to religious conversions, is historically accurate. But what it fails to

take cognizance of is the Mahatma's consistently expressed disdain for the activities that would today go under the name of "reconversion". *The Collected Works of Mahatma Gandhi* abound with deprecatory references to Shuddhi and Sanghatan – which were Hindu communalism's effort to win back Muslims and Christians to what they construed as the true national faith.

Much has been made, again, about the Christian missionaries' supposed tendency to run down the basic tenets of Hinduism as part of their effort to win souls over to their faith. This overlooks the historical fact that the challenge to Hindu beliefs has more often come from within its own ranks. As part of their ideological challenge to the caste system, great social reformers like Jyotiba Phule and B.R. Ambedkar frequently used the most derogatory terms in reference to the Hindu pantheon. But as Gandhi recognised, this was not a challenge that could not be met by responding in kind, but by confronting the iniquities of the system that provided a breeding ground for these resentments.

S ARNEJA

Pope John Paul II paying homage at Rajghat, the samadhi of Mahatma Gandhi.

The VHP campaign finally is a manifestation of social reaction. Its fundamental procedure could be characterised in recently coined political terminology as one of "stigmatisation and emulation". A threat perception from an alien cultural influence is first fostered in the minds of the target population, who are then reclaimed by the supposedly indigenous religion through methods that in others' hands were decried as a mortal danger to the national culture.

Ever since it was founded in 1964, the VHP's strategy has been premised upon the emulation of the methods of medieval religious proselytisation. At its founding conference it was entrusted the tasks of "consolidation and strengthening of Hindu society", the "protection and dissemination of Hindu spiritual and ethical values" and the "establishment of links among Hindus living in different countries". The proposed method was to create an ecclesiastical order, complete with its own liturgy, scripture and institutional hierarchy. Individual priests manning shrines across the country were to be coopted into a network of VHP sponsorship. In another conscious reversion to the medieval model of religious organisations, VHP activists were designed as the lay order which would impart the necessary momentum for social consolidation along religious lines.

SINCE assuming the papacy in 1978, John Paul II has exerted a powerful political influence across the globe. A book which comes to the market on the tenth anniversary of the fall of the Berlin Wall, complete with heavy recommendations from America's arch-conservative Heritage Foundation, names him as one of six "heroes" who changed the course of the world through the years of the Cold War. The book allegedly "shatters the perception that the Soviet Union collapsed either by accident or from its own internal problems". Instead, it documents the exertions of the six heroic individuals – among them Ronald Reagan, Winston Churchill and Harry Truman – that contributed to this very happy denouement.

Yet paradoxically, John Paul II is also credited in some quarters with having depoliticised the Church. His memorable visit to Latin America in 1983, for instance, is best remembered for having turned the clock back on evolving notions of an activist Church. Paul VI's 1967 encyclical "Popularum Progressio" had laid out the circumstances in which the Church could act in support and sustenance of popular rebellions against oppression. Following this, the Latin American Bishops Conference at Medellin, Colombia, in 1968, had imparted a strong momentum to the principles and practice of Liberation Theology.

John Paul II firmly shut the door on Liberation Theology, confining his agenda to raising the profile of the Church within civil society. His notion of evangelisation is conservative and dogmatic. For political structures that are aligned with the forces that today dominate the global economy, it is palpably an unthreatening notion. The VHP's challenge to the Pope's visit, in this sense, is a case of social reaction rising up in opposition to conservatism. Being devoid of a marked ideological polarity, it is a challenge that was always unlikely to gain significant momentum. ■

Agendas and appointments

A clutch of appointments by the Human Resource Development Ministry under Murli Manohar Joshi raises disturbing questions.

T.K. RAJALAKSHMI
in New Delhi

MURLI MANOHAR JOSHI cleared two crucial appointments just two days into his renewed tenure as Union Minister for Human Resource Development. M.L. Sondhi, a former Professor at the School of International Studies in Jawaharlal Nehru University (JNU), was appointed Chairperson of the Indian Council of Social Science Research (ICSSR), and B.R. Grover, who was nominated a member of the Indian Council of Historical Research (ICHR) in 1998, earned a promotion to the Chair.

Sondhi was a young and highly regarded official of the Indian Foreign Service when he dramatically quit for a career in politics. His best-remembered political feat still remains the shock defeat he inflicted on Congress(I) stalwart Mehr Chand Khanna in New Delhi in the 1967 Lok Sabha elections. Having served out a term as a Jan Sangh Member of Parliament, Sondhi sought a career in academia after being defeated in the 1971 elections.

Grover served for long as Director in the ICHR, although he achieved renown after a fashion only in his post-retirement advocacy of the Vishwa Hindu Parishad's (VHP) claim to the site of the Babri Masjid in Ayodhya. He was a leading member of the panel of historians constituted by the VHP at the Chandra Shekhar Government's suggestion, to establish the historical veracity of the case of the Ram Janmabhoomi. Post-Ayodhya demolition, Grover has remained an unrepentant votary of the view that vandalism in the distant past can be justification for acts of retribution today.

Grover and various other historians and archaeologists associated with the Ayodhya campaign of the VHP earned the censure of the World Archaeological Congress (WAC), when it held a session in New Delhi in 1994. His nomination as a member of the ICHR in June 1998 was, for this reason, occasion for a bitter controversy within the profession of historical research. His elevation as Chairman is unlikely to be any less acrimonious.

In contrast, Sondhi has not been conspicuously linked with any overt political campaigns in the domestic arena. He has been a courtly and soft-spoken participant in the seminar circuit in New Delhi, particularly those concerned with less popular causes such as the "liberation" of Tibet and friendship with Israel. His appointment to the apex position in ICSSR represents a quantum shift in the ethos of the institution.

Grover and Sondhi do not collectively match the absurdity of another nomination by the HRD Ministry. K.G. Rastogi, an obscure Professor from Delhi, has been appointed to the search committee for faculty appointments in the National Council for Educational Research and Training (NCERT). Far from his academic credentials, Rastogi is best known for a lurid autobiographical account of Partition, in which he acknowledged that he shot dead a Muslim woman at close quarters to save her from a rampaging mob of Hindus. He subsequently took up a career in academia, though never with great distinction. In his participation in *shakhas* of the Rashtriya Swayamsevak Sangh (RSS), though, he was very consistent.

AKHILESH KUMAR

Human Resource Development Minister Murli Manohar Joshi.

IT is learnt that these appointments had been decided well before their actual announcement – the delay being entirely on account of the intervening inconvenience of the model code of conduct for the electoral season. The HRD Minister, associated with the more extreme ideological fringes of the BJP, has once again been true to form. These apprehensions were reinforced when news emerged of the omission of Marxist theory from the political science syllabus in Central Board of Secondary Education-stream schools. Agitated members of the Left parties raised the matter in Parliament, accusing the Government of seeking to stop "the free flow of ideas" and bringing in a phase of "intellectual fascism".

While other major political theories of Liberalism, Socialism, Fascism and Gandhism were as usual present in the syllabus for "Concepts and Theories in Political Science", Marxism was conspicuously absent. But for an alert teacher from a school in Delhi, the supposed omission would perhaps not have been detected. The CBSE, for its part, held that the Hindi version of the printed syllabus contained Marxist theory, which made the omission in the English version at worst a printer's devil. Yet the faculty of education in the Delhi University is reluctant to accept this as an "inadvertent error'. There seems to be too strong a pattern evident in Joshi's decisions as HRD Minister to permit this kind of a casual reading.

The Minister, however, seems unfazed. Grover, he argues, has served as director of the ICHR for 12 years and has otherwise been associated with the organisation for over a decade. This alone should be adequate to establish his credentials for the Chairman's post.

While none of his critics dispute the fact that Grover's long stint in the ICHR as Director was relatively uncontroversial, they have chosen to question his unrelenting commitment, since 1986, in opposing any resolution relating to the preservation of cultural heritage in the Indian History Congress. His interventions have since shown a persistent bias. In 1992, at the Calcutta session of the IHC, the then Secretary, V. Ramakrishna, took cognizance of communal disturbances in the aftermath of the demolition of the Babri Masjid. Grover objected, stating that it should not be part of the Secretary's speech.

Later, as a member of the Delhi session of the WAC in 1994, Grover opposed a resolution moved by liberal historians condemning the demolition of the Masjid. Further, in a conference of the WAC at Croatia in May 1998, he opposed a resolution condemning the "manipulation of archaeological evidence to justify destruction of historical structures". He led a group, including B.B. Lal and three others, out of the Congress, rather than be party to the adoption of the resolution.

In the IHC, Grover has chosen to oppose various important policy resolutions, including the defence of unbiased textbooks (Hyderabad session, December 30, 1978), the promotion of translations in Indian languages (Bombay session, December 28, 1980). In the Annamalainagar session in December 1984, he opposed a resolution against communal strife. At the Goa session in 1987, he voted against a resolution criticising the biased representation of legend and history on television.

Further, in comparison to previous incumbents in the ICHR, such as R.S. Sharma, Niharranjan Ray, Irfan Habib and Ravinder Kumar, Grover's academic credentials are far from impressive. He has to his credit two articles in the *Indian Economic and Social History Review* – one on the village community published in 1971 and the other on land rights in Mughal India, published in 1976. And while he served for long as Reader in History at Jamia Millia Islamia, Delhi, he has neither a Ph.D nor the title of Professor to his credit.

HISTORIANS of a liberal and secular persuasion are alarmed at the prospect of the nodal agency for sponsorship of historical research passing into the control of a person who has opposed every resolution condemning the demolition of the Babri Masjid. Delhi University historian Sumit Sarkar feels that the current practice of packing institutes with people conforming to the Hindutva ideology is qualitatively different from all that has been seen in the past.

Sarkar points out, for instance, that Irfan Habib was the ICHR Chairperson during the Rajiv Gandhi regime, although he is affiliated to the Communist Party of India (Marxist), a party that consistently opposed the Congress(I) during that period. There was no systematic packing of academic bodies, and people known to be RSS sympathisers too were appointed to positions of responsibility.

Again, there are questions of basic academic stature involved. Irfan Habib and R.S. Sharma were historians of international repute even before the ICHR was set up. If the Hindutva lobby has been unable to appoint persons amenable to it earlier, it has been due to a sheer paucity of serious scholarship within their ranks. Sarkar argues that since the 1992 demolition, a variety of historical thinking has gained ground that reinforces old and discredited stereotypes, reversing the progress achieved over the years in charting new vistas of scholarship. Joshi's appointments in the ICHR clearly are designed to deepen this regressive trend.

Illustrations are not lacking. The ICHR decided in July this year to publish all the titles of the Bharatiya Vidya Bhavan series on History and Culture of the Indian People, the General Editor of which was R.C. Majumdar, who is considered by Left historians to be a Hindu revivalist historian. Although this decision was taken during the tenure of former Chairperson S. Settar, there is little doubt that it may have been influenced by the BJP-led government in power.

The inclination towards fostering a democratic and secular mindset has been set aside in the recent appointments. As an observer put it, the BJP's slogan in education appears to be "forward to the primitive past."

Surpassing all this, however, is the nomination of K.G. Rastogi to the Selection Committee of the NCERT. In his 190-page autobiography published in 1998 and dedicated to the RSS, Rastogi devotes three chapters to his life in the RSS. Called *Aap Beeti* (My Life Experiences), the autobiography carries a foreword by RSS ideologue K.C. Sudarshan. In the section about the author, it is mentioned that Rastogi was an RSS *pracharak* for ten years. In one chapter, where he talks about his days with the RSS, he narrates how he learnt to use rifles, tommy guns, sten guns and hand grenades in the period following Partition. He was in Bharatpur at that time and was anointed the district security chief by the RSS – ostensibly to protect the lives of Hindus. Anti-socials and Kshatriyas were trained to take on the enemy.

Rastogi writes that in one such skirmish in a place called Puran Kaliyar near Hardwar, a beautiful woman was sighted in one particular house where killings were going on. Some of the attackers (read the Hindu mob) began to waver in their resolve and, unmindful of their objective, began to assert their rights over the woman. "Then an idea struck me. I threatened the attackers, even abused them and then shot dead the woman, who was the root cause behind the fight. I thought that I had killed two birds with one stone. Everyone was shocked at this extraordinary spectacle, but got back to their work." (page 46, *Aap Beeti* by K.G. Rastogi). Rastogi goes on to express his regret for having done this inhuman deed, but he does not stop to ponder why he could not have shot the attackers.

In another chapter, where he describes his first visit to the United States, he speaks glowingly of his late wife who "asked him to fulfil his needs in the period that he was away from her." This permission to act freely apparently helped him control his wayward senses. Sudarshan too highlights this particular statement by Rastogi's wife in his foreword to emphasise the sacrificing and noble character of Hindu women.

In another chapter titled "Professor Ho Hi Gaya" (I finally become a Professor), Rastogi records how one of his friends approached an expert in the selection panel to recommend his name for the post of a Hindi Professor. However, it appeared that the expert had already promised the post to another candidate. This was during the years Rastogi was at the NCERT. He served in the Council

between 1964 and 1988, and to that extent, he is no outsider.

After 1988, he went back to the RSS, apparently to serve as a full-time *pracharak*, only to resurface in 1999 as Joshi's nominee to the Selection Committee. Previous nominees include noted sociologist S.C. Dube and historian Bipan Chandra. As the Minister's nominee, he will have the clout to influence key appointments. His hand has apparently been detected in a number of top appointments, notably that of the Director, NCERT, and the Chairman, National Open School. Rastogi is also known to be the convener of the Akhil Bhartiya Vidya Bharati Shiksha Pratisthan, a self-proclaimed affiliate of the RSS in the field of education.

Rastogi's candid confessions have sent an expected tremor not only in the NCERT, but in other teaching and research institutions too. What academics within and outside the institution fear is that the Council's credentials would be used to push forth the very kind of curricula that were rejected by it in some States. It may be recalled that in early 1993, a National Steering Committee on textbook evaluation had, after considering the History, Hindi and Mathematics textbooks of Uttar Pradesh and those of the Saraswati Shishu Mandir Prakashan, found them full of inaccuracies, distortions and communal bias.

Ever since the new Director of the NCERT took over, there has been much talk about changes in the curriculum. A Curriculum Committee which has been set up received feedback from various departments in the Council, but has kept everybody ignorant about the nature of its deliberations. "It is not a confidential thing and does not call for this hush-hush attitude," said a senior faculty member.

Rastogi is reportedly advising the NCERT in designing a new curriculum. Academicians feel that he will, as a member of the vital Programme Advisory Committee, be able to push the Hindutva agenda in the field of education. The HRD Ministry plans to announce several new programmes over the next 100 days, including one on reviewing school curricula and making them "relevant to life".

Evidently, the criteria of competence has been set aside in Joshi's recent appointments, as also the inclination towards fostering a democratic and secular mindset. As a bemused observer puts it, the BJP's slogan in education, as in many other respects, appears to be "forward to the primitive past". ■

PROJECTS

An unfinished story

Started with high expectations by the Anthropological Survey of India in the mid-1980s, the People of India project would seem to be in need of a final push.

T.K. RAJALAKSHMI
in New Delhi

THE first major survey of all the communities in India, The People of India project, conducted under the auspices of the Anthropological Survey of India (ASI), has become the subject of a controversy. The project, launched on October 2, 1985, was to have been completed in 1996 with the production of a corpus of 43 volumes. Under the terms of the agreement between the publishers and the ASI, the volumes should have been published between 1992 and 1996.

Sources in some quarters concerned said that the deadline had not been met owing to the play of various factional interests Work was slowed down deliberately, and the rising price of paper acted as a disincentive. The plan was to bring out first the volumes pertaining to the smaller States followed by the volumes on the larger ones Thirty volumes were published and 13 remained in various stages of completion. The two volumes, on Tamil Nadu and Chandigarh, were printed but were not released for two years because their prices had not been fixed.

However, according to Dr. K.S. Singh, former ASI Director-General and the architect of the POI project, at least five volumes went into multiple editions. He said that the publisher handling the volumes on western India reported that 300 copies of the volume on Rajasthan had been sold in one month. K.S. Singh told *Frontline* that several publishers went slow because of the uncertainty relating to the prices Work on three volumes, those on Jammu and Kashmir, Punjab and Uttar Pradesh, were stopped because

S. MAHINSHA

The People of India project establishes the fact that there are few essential differences between Indian communities although they are divided on caste and religious lines.

there was no agreement with the publishers on prices. The volumes on Karnataka, Gujarat and Assam were in the final proof stage, and those on Andhra Pradesh, Maharashtra, Bihar, West Bengal and Orissa were in the penultimate proof stage, while the volume on Madhya Pradesh was in an early proof stage, he said

K.S. Singh said that he had raised the problem of delays at the Advisory Committee meeting in June last year and moved a resolution stating that the publication process should be expedited. According to informed sources, the advisory committee has not met this year. It is learnt that the ASI headquarters in Calcutta is responsible for fixing prices. R.K. Bhattacharya, its Director, was unavailable for comment, but a source at the ASI headquarters told *Frontline* that the delay had occurred mostly because of an "overambitious editor" who was still looking for ethnographic material. He expressed fears that the data collected so far were becoming outdated because of the delays involved in editing and fieldwork. He said that the volume on Tamil Nadu was delayed because of the pricing policy; he held the particular editor responsible for the delay with regard to the other volumes.

The source said that the ASI was anxious about the delay and that the rising price of paper affected the pricing policy. The matter was being taken up with the Department of Culture, but he would not say how long it would take for a decision to come through. K.S. Singh, however, maintained that the ASI could decide the prices on its own and that the pricing agreement was between the ASI and the four publishers selected for the project. The Government had earned a good amount of money as royalty and there was no question of any resource crunch, he said, and added that the delay was entirely owing to the activities of vested interests.

THE POI was considered the most important of the 14 national projects identified by the ASI in 1985-86 as part of its seventh five-year plan. It identified 4,694 communities in terms of their cultural traits. Endogamy, occupation and perception defined a community. Each community derived its identity from its environment, resources, occupations and territory. K.S. Singh wrote: "This rootedness in the local eco-cultural system is an outstanding characteristic of our communities, no matter what religious label is attached to them."

The delay in publishing all the volumes amounted to a serious loss in sociological terms because of the intrinsic merit of the data which, among other things, show that the similarities among the various Indian communities are more prominent than the differences. The POI project is significant as it demystifies the diversity in the Indian context and establishes the fact that there are few essential differences between Indian communities although they are divided on caste and religious lines. It attempts to highlight the linkages among them and prove that there is a considerable level of homogenisation among communities in terms of morphological and genetic traits at the regional level.

As many as 775 traits concerning ecology, settlement, identity, food habits, social organisation, economy and occupation, linkages and the impact of change and development were studied. The percentage of traits shared by communities within a linguistic or cultural region was found to be high.

Within a region, barring tribal communities and certain localised occupational groups, there is remarkable homogeneity in physical types among other communities.

In Tamil Nadu, for instance, Brahmin and non-Brahmin communities share similar traits. A Tamil Brahmin has fewer traits in common with Brahmins in Western or Northern India. This marked a significant departure from H.H. Risley's classification of the upper castes into the Caucasoid type and the large sections of the population into the Proto-Australoid type.

The POI has estimated that Hindus form 76.4 per cent, Muslims 12.6 per cent, Christians 7.3 per cent, tribal religionists 8.3 per cent, Jains 2.2 per cent, Buddhists 2 per cent, Sikhs 2.8 per cent, Jews 0.2 per cent and Zoroastrians 0.19 per cent of the population.

The survey found that 87 communities followed Hinduism and Sikhism, 116 Hinduism and Christianity, 35 Hinduism and Islam, 21 Hinduism and Jainism, 29 Hinduism and Buddhism, and 94 Christianity and tribal religions. There were 16 communities that follow three religions. Forms of Hinduism include the worship of family and clan deities.

Significantly, the survey found that communities may be differentiated along religious lines but shared a very high percentage of traits. Hindus share 96.77 per cent of their traits with Muslims, 91.19 per cent with Buddhists, 88.99 per cent with Sikhs and 77.46 per cent with Jains. Muslims share 89.95 per cent traits with Sikhs and 91.18 per cent with Buddhists. The extent of Jain-Buddhist sharing of traits is 81.34 per cent.

K.S. Singh said: "When I wrote this seven years ago, no one believed it. The traits we share are far more than the traits we do not share. This large-scale sharing could be that most communities have emerged from the same ecological, ethnic, socio-cultural background, even though they later embraced different religions or other ways of life."

The POI project also found that only about 20 per cent of the communities in India follow a vegetarian diet. In 2,469 communities, men consume alcoholic drinks occasionally, while in 1,106 communities men consume alcohol regularly. In 1,037 communities, women consume alcohol occasionally. Smoking, tobacco-chewing and the use of snuff are widespread. The habit of betel-chewing is common to a large number of communities.

Rice is a more popular cereal than wheat. Except the Todas of the Nilgiris, the consumption of milk in tribal communities is a recent phenomenon. Bilingualism is widely prevalent. The survey revealed the existence of 12 new minor scripts.

The project engaged 470 scholars, of whom 245 were from outside the ASI. Twenty-six other institutions were involved. Investigators spent 24,880 days in the field and interviewed 21,536 people, including 5,353 women.

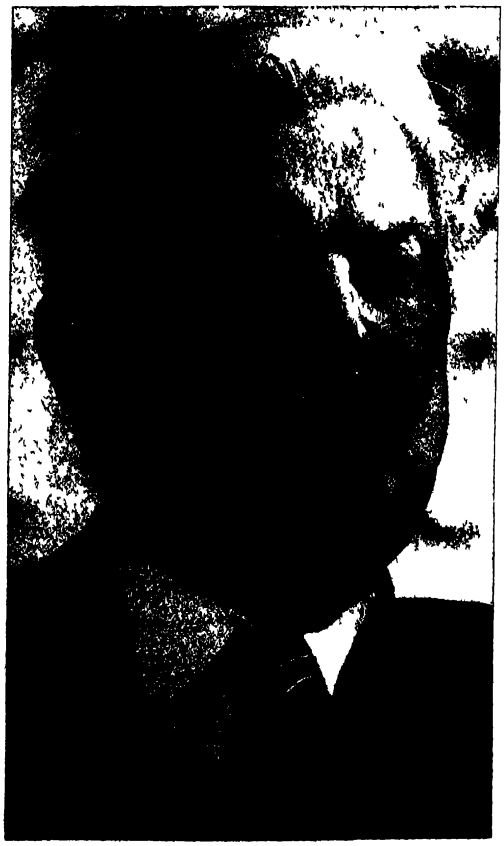
In a mood of optimism, K.S. Singh wrote: "By the end of the century, we should have a large corpus of material running into about 100 volumes covering the biological, linguistic and cultural profiles of the people of India." But today, the fate of the remaining volumes remains unknown.

Besides, "the diversities that have flourished in a state of relative cultural freedom" are threatened by the overemphasis of a homogenised, uniform and monolithic culture by certain obscurantist sections. Sociologist M.N. Srinivas wrote in the Foreword to the introductory volume of the POI project: "People are willing to accept different dance styles in different parts of the country, why cannot they accept different dietary habits?"

The findings of the POI project shatter several notions about differences among communities. It is important that the remaining volumes are published and the findings disseminated. ■

Between monetarism and Keynesianism

Robert Mundell and open economy macroeconomics.



PRABHAT PATNAIK

ROBERT MUNDELL, this year's Nobel laureate in Economics, is best-known for his work on open economy macroeconomics in a world with capital mobility. One of his results, in particular, which was also arrived at by J. Marcus Fleming (hence the appellation "Mundell-Fleming model" under which this result has gained currency), was quite striking. This states that in a world with highly mobile capital flows and flexible exchange rates, fiscal policy becomes completely ineffective in influencing the level of activity in the economy. (Marcus Fleming is on the staff of the International Monetary Fund.)

The reasoning behind this result is simple and straightforward. If capital is highly mobile across countries, then no country can have an interest rate which is different from what prevails elsewhere. (Interest rate differentials were considered by him to be the major determinant of capital flows.) For any country, then, the interest rate is in effect given "from outside". Now the ratio of money income to money supply (or what is called the income velocity of circulation of money) usually varies with the interest rate, so that if the latter is given "from outside", then money income in the country must depend entirely on the level of money supply. At any given level of money wages, this level of money income implies a unique level of employment and output. It follows then that as long as money supply and money wages are given, output and employment get automatically fixed in a world where capital is highly mobile, and no amount of fiscal stimulus can possibly alter it.

Suppose, however, a government insists on expanding its fiscal deficit with the objective of increasing employment. Then, since any employment increase (necessarily associated with a rise in money income) would, with given money supply, create a shortage of money and a rise in interest rate, capital would flow in from outside, leading to an exchange rate appreciation, and a reduction in net exports. The reduction in net exports (that is, exports minus imports) in equilibrium would exactly match the rise in fiscal deficit; the effects of the two would cancel one another and employment would remain exactly where it was despite the rise in the fiscal deficit.

Mundell is located in the grey area between monetarism and Keynesianism... but even this degree of deviation from orthodoxy is anathema to the Nobel Committee.

ALASTAIR GRANT / AP

Robert Mundell.

Putting the result another way, in a world with high capital mobility and flexible exchange rates, there is no scope for an effective fiscal policy. Likewise, Mundell showed that in a world with fixed exchange rates and high capital mobility, there is no scope for an effective monetary policy: the interest rate is given "from outside" and money supply must adjust to the demand for money, for, if it did not, then the pressure on interest rate would bring in capital inflows, which, under a fixed exchange rate, would boost exchange reserves and make the requisite addition to money supply.

Such a high degree of capital mobility (an infinitely elastic supply of capital at the going interest rate) is of course an extreme case. If capital inflows are more sluggish, then there would be scope for using both fiscal and monetary policy, and it becomes possible to use the two in such a way that each tries to meet a particular objective: fiscal policy, for instance, can be used to achieve a particular level of activity and monetary policy to achieve a particular exchange rate.

Mundell wrote many more articles in this broad area, though none as startling as the Mundell-Fleming model. In addition, he wrote on optimum currency areas, that is, on the question: when should a set of currencies be linked to one another as one united currency (such as the "Euro")? One of his conclusions that is of some interest is that the currency area should be one over which there is free labour mobility, for, otherwise, unemployment in a particular region would be impossible to get rid of.

Even though the contemporary world, characterised by capital mobility, does represent the universe that Mundell was approximating, his open economy macroeconomics is too limited to shed much light upon it. It is limited in two ways: first, in all his models, whether capital flows respond sluggishly or with infinite elasticity to interest rate changes, they are a determinate function of the interest rate (and of other additional

variables that one might add). There is no scope, in other words, for the volatility of capital flows. Secondly, the role of expectations, in particular of expectations regarding exchange rate (or asset price) movements, is ignored. Two major features of the contemporary world which give rise to disequilibria do not figure therefore in Mundell's analysis (or indeed in any subsequent "mainstream" work that took off from Mundell). But he was one of the pioneers in this field, and no matter what assessment one makes of the significance of his work, the Mundell-Fleming model would certainly continue to be taught in any course on open economy macroeconomics.

ROBERT MUNDELL, however, was not an unalloyed monetarist, such as is the fashion these days, despite his location in Chicago. His analysis used the IS-LM curves (known to every undergraduate) which were devised by John Hicks as an exposition of Keynesianism in its relationship with the pre-Keynesian "Classics".

More important, Mundell's work, especially in the short-run context, recognised the possibility of involuntary unemployment (even though he put it down to wage-rigidity). In short, he can be intellectually located in the grey area between monetarism and Keynesianism, which is what one would expect a Canadian economist writing in 1963 (the date of the Mundell-Fleming model) to be. However, it is noteworthy that even this degree of deviation from orthodoxy is anathema to the Nobel Committee.

In the Nobel Prize citation for Robert Mundell, the committee refers to his assumption of "price rigidity" (which yields involuntary unemployment) as a "limitation" that was corrected by later writers. It uses his argument to set different objectives for monetary and fiscal policies as a justification to make the central bank free of government control (even though he was not arguing this). And its talk of the difficulties faced by temporarily-fixed, but adjustable, exchange rate regimes in a world with capital mobility, carries the suggestion that flexible rates are the answer, even though restrictions on capital mobility could overcome the problem equally well. Whether it honours an Amartya Sen or a Robert Mundell, the Nobel Committee is not without its own agenda. ■

Prabhat Patnaik is Professor of Economics, Jawaharlal Nehru University, New Delhi.

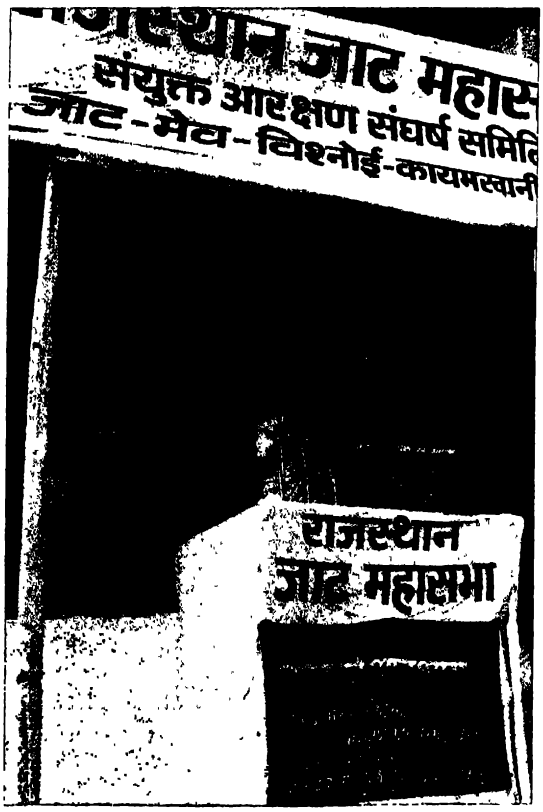
ACROSS BORDERS FOR A CAUSE: Medecins Sans Frontieres (Doctors Without Borders), a Brussels-based humanitarian group, has won this year's Nobel Peace Prize. The organisation, established in 1971, differs from many other organisations of its kind in that it acts independently of governments and often speaks out for the people who suffer. The Nobel Committee said that it selected the group from among 136 nominees. In making the choice, it cited the group's "pioneering work on several continents" and its outspokenness. Over the years, the organisation has assisted, among others, earthquake victims in Nicaragua, refugees in Cambodia and famine-affected people in Somalia. Recently, its volunteers served in Kosovo and East Timor. Medecins Sans Frontieres has [illegible] members working in local networks and 1,500 others, [illegible] factors, working in 80 countries. More than 20 of these countries are in zones of conflict. Here, volunteers of the organisation in Liberia.

The politics of reservations

The BJP-led Government's decision to include the Jats of Rajasthan in the backward classes list has caused the first breach in the covenant that the enumeration arrived at by the Mandal Commission and various States would not be seriously modified.

SUKUMAR MURALIDHARAN
in New Delhi

FROM the moment the Mandal Commission recommendations were implemented it was foretold that an immediate consequence would be an unseemly rush among various communities for the appellation of backwardness. Clearly, all sections that might have feared being left behind in the race for status and power had reason to covet the relative privileges assured to those who met the criteria of social and educational backwardness.



Part of the challenge of running an effective programme of affirmative action lay in resisting sectional pressure for the benefits that are associated with the tag of backwardness. There was, in other words, a tacit premise of restraint underlying the programme – a political compact that the enumeration of backward classes arrived at by the Mandal Commission and the periodically updated lists of the State governments would not be seriously modified.

Shortly after taking office on October 13, the Atal Behari Vajpayee Government committed the first breach in this covenant. Although a formal notification is yet to be issued, it is reliably learnt that the Bharatiya Janata Party-led Government has delivered with extreme alacrity on its campaign pledge to confer the backward class status on the Jats of Rajasthan. It was a demand that had loomed large over the election campaign, though its precise impact is still debatable.

Indications are that the BJP did succeed in winning over a large section of the Jat community from their traditional allegiance to the Congress(I) by assuring them that the demand for backward class status would be met. Yet, despite a substantial desertion of a traditional constituency, the Congress(I) did not really suffer a serious erosion in its share of the popular vote. Evidently, the defection of the Jat vote was made good by an accretion of other social constituencies to the ranks of the Congress(I). The BJP's sweeping triumph in Rajasthan is in this reckoning attributable less to the Jat factor than to the recruitment to its cause of voters who had remained uncommitted in the 1998 Assembly elections.

In the moment of its triumph, though, the BJP did not stop to ponder over these subtleties. It had under consideration a report by the National Commission on Backward Classes (NCBC), dating back to November 1997, which had recommended that the Jats of Rajasthan did merit the benefits of the special protections available under the Mandal Commission recommendations. This was one among the many advisories submitted by the NCBC, recommending the inclusion of 372 distinct communities in the backward classes list. Since the political motivation behind accepting the recommendation on the Rajasthan Jats alone would have been obvious, the Government, it is reliably learnt, has decided to ratify the NCBC findings in respect of 130 communities. As for the rest, they are understood to be still "under consideration".

Section 9(2) of the Act of Parliament setting up the NCBC stipulates that the recommendations of the Commission shall "ordinarily" be binding on the Central Government. This effectively removes the scope for selective implementation of the NCBC's recommendations, though it does still allow for delays. The pace of the Government's deliberations could in each case be carefully calibrated to a calculation of the political dividend that could be earned from cultivating a particular community.

G. L. SUNGER

At a rally of the Jat Mahasabha in Jaipur in August.

Obviously unnerved by the election outcome and the Central Government's alacrity, the Rajasthan State Government led by Chief Minister Ashok Gehlot lost little time in announcing its intention to bring Jats into the State list of backward classes. This really is the more substantive achievement for the sustained campaign that the community has run for the last one year. The Mandal Commission recommendations only pertain to the stagnant pool of employment opportunities in the Central Government sector. But the State Government list has a bearing on the crucial area of reservations in local bodies.

Panchayat institutions were once an important locus for the projection of Jat power. But once reservations for the backward classes became an

element of official policy, Jats found themselves isolated from the positions of dominance in local bodies. More than access to public employment, this was the crucial factor impelling the Rajasthan Jats towards the path of militancy in their quest for the backward status.

In quickly giving in to the demand after an adverse electoral outcome, the Congress(I) may have undermined its own longer-term strategy of cultivating other social constituencies to substitute for the Jat desertions. The capitulation also serves notice that the policy of affirmative action is susceptible to lobbying pressures and power politics. The Central Government had the shroud of legitimacy for its decision in the recommendation of the NCBC, while the State Government had none. In fact, the growing politicisation of a judicial function recently had a casualty in the resignation of the Chairman of the Rajasthan State Backward Classes Commission, Justice R.S. Verma. His grievance was simple: when he was engaged in the elaborate process of adjudication over the Jats' claim for inclusion in the backward classes list, Prime Minister Vajpayee had during election campaign in Sikar, Rajasthan, seemingly already settled the question in favour of the petitioners.

R V MOORTHY

Justice P.K. Shyam Sundar, Chairman of the National Commission on Backward Classes.

The situation in Rajasthan today is replete with anomalies. The State Backward Classes Commission is considering applications from a diversity of communities, including Bishnois, Meos, Kayamkanis and Sindhi Muslims. In their agitational phase, Jats had sought to make common cause with these other communities that seemed to have a somewhat better case for inclusion in the list of backward classes. But political volubility ensured that the Jat case gained acceptance, while all the others languish in neglect. When asked about this situation, Gehlot reaffirmed his resolve to have a speedy consideration of these cases by the Backward Classes Commission. Of course, this required at the minimum that the Chairman of the Commission would withdraw his resignation. Failing that, a new chairman would have to be minated and the work of the commissio begun all over again.

ustice P.K. Shyam Sundar, Ch man of the NCBC, insists on retaining he confidentiality of his advisory opinions until they are actually implemented. This, he says, is a minimum requirement of administrative propriety. And since his advice on the Jats has not yet been formally implemented, the premises and assumptions on which it has been based are yet unknown. Shyam Sundar did reveal, though, that the relative social inequities that the Jats of Rajasthan confronted were a decisive factor in moulding his opinion. It is not so much the actual condition of the community that was critical, but its relative social position in relation to dominant communities such as Brahmins and Rajputs.

This is one among many criteria that have been used in the past to determine the degree of social debility that a community faces. The reality of affirmative action in India today is of a multiplicity of concepts contending for influence in the categorisation of social classes. The four southern States and Maharashtra have adopted a taxonomic pattern that is rather expansive in its coverage. Further, since backward class movements and compensatory reservations have a relatively long genealogy in these States, they all have fairly stable and well-accepted enumerations of the beneficiary groups.

GOPAL SUNGER

Chief Minister Ashok Gehlot.

In stark contrast are the Hindi-speaking States in the west, Madhya Pradesh and Rajasthan, and the eastern States of West Bengal and Orissa – where the term "backward classes" has had no significant role in state policy. The Mandal Commission brought this category to the forefront, but its taxonomy of classes was unfortunately based on the economic conditions of households as reported in the 1931 Census. This was a rather dubious recourse that the Commission had to take, because the Central Government effectively outlawed caste as a census category in 1951. Though the census enumeration in 1951 did collect data on caste and its social and economic correlates, it was not analysed in terms of these parameters on account of an aversion to caste in the early Nehruvian years.

The first Backward Classes Commission headed by Kaka Kalelkar confronted this rather ambivalent situation with an excess of bravery: "In the absence of reliable facts and figures, the only course open to us was to rely on the statistics available from the various Governments and the previous census reports, and to go by the general impressions of Government officers, leaders of public opinion and social workers." In certain cases, the Commission had no data at all and was compelled to take a decision on "the strength of the name of the community only, on the principle of giving the benefit of the doubt". And though the Kalelkar Commission shared prevalent reservations about utilising caste and community as markers of social distinctions, it was absolutely clear that it would be "difficult to avoid caste in the present prevailing conditions".

The Kalelkar report was tabled in Parliament in 1956 and it was accompanied by a scathing official note from the

Government deprecating the use of caste as a category. The Government noted that caste was "the greatest hindrance in the way of our progress toward an egalitarian society" and warned that the recognition of specified castes as backward may serve to maintain and perpetuate the existing distinctions on the basis of caste". The Government said that the criteria evolved by the Commission, when they were not exclusively dependent on caste, were "obviously vague".

The Kalelkar report was summarily thrown out of court with the observation that "further investigations will have to be undertaken so that the deficiencies that have been noticed in the findings of the Commission are made good and the problem is solved..." There was, in other words, a tacit recognition that a problem existed which called for solution.

The Mandal Commission, which submitted its report in 1980, was the next attempt at the Central level to address this problem. But the data base that it used was as infirm and uncertain as ever. In clearing the way for the implementation of the Mandal recommendations in 1992, the Supreme Court ruled in the historic case of *Indira Sawhney versus the Union of India*, that the Central government and all State governments should set up permanent commissions to review the list of beneficiaries continually. As Justice T.K. Thommen put it: "Identification of backwardness is an ever-continuing process of inclusion and exclusion. Classes of citizens entitled to the constitutional protection of reservations must be constantly and periodically identified for their inclusion and for the exclusion of those who do not qualify. To allow the undeserved to benefit by reservation is to deny protection to those who are meant to be protected."

The proposed commissions were envisaged as quasi-judicial bodies which would conduct their deliberations in an environment free of political influence – a condition unlikely to be met in the best of circumstances. Further, the Supreme Court did not seem to give much attention to the possibility of a conflict between Central- and State-level assessments. This is an infirmity which has been reinforced by the default of successive Ministries at the Centre on the fundamental obligation to define norms for identifying backward classes. The recent decisions of the BJP-led Government show how in the growing crisis of ambiguity that shrouds reservations policy, expediency is likely to triumph finally. ■

■ RESERVATIONS

A denial of rights

A committee set up by the Tamil Nadu government to study the working of the reservation system for the Scheduled Castes and the Scheduled Tribes finds that these oppressed people have by and large been denied the benefits of the statutory provision.

S. VISWANATHAN

EVEN 50 years after its introduction, the statutory reservation for the Scheduled Castes (S.Cs) and the Scheduled Tribes (S.Ts) in government service has not improved to any significant extent the status of these oppressed sections of Indian society. The experience of Tamil Nadu, which has a history of struggles since pre-Independence days against caste-based discrimination, is a case in point. Dalit organisations in the State often complain that the provision is implemented in a half-hearted manner and that the representation of the S.Cs and the S.Ts in government service falls short of the levels (18 per cent and 1 per cent respectively) fixed on the basis of their share in the State's population.

For the first time, a committee appointed by the State government has gone into various aspects of reservation for the S.Cs and the S.Ts. After a detailed study of the data it collected, the committee concluded that the S.Cs and the S.Ts did not have due representation in government services. The committee has identified the reasons for this and recommended measures for the effective implementation of the reservation provision.

Dalit organisations complain that the representation of the S.Cs and the S.Ts in government service falls short of the levels fixed on the basis of their share in the population.

THE study has brought into focus the indifference of successive administrations to the task of ensuring that the benefits of the statutory provision reached the underprivileged. For instance, although the Constitution provides for "due" representation for the S.Cs and the S.Ts in government services, it took years to determine the quotas for the two sections. In the bureaucracy's reckoning, the interests of the existing administrative pattern and the existing staff take precedence over the constitutional right of the S.Cs and the S.Ts. No department has evolved a foolproof system for the proper implementation of reservation. No study has been made on whether, in a multi-stage administrative system, reservation at the entry point alone can ensure due representation for these sections in subsequent stages as well.

According to the study, the 1989 and 1993 Government Orders for special appointments in an attempt to clear the backlog of vacancies reserved for the S.Cs and the S.Ts have not been enforced in a fair manner. At least three State G.Os and two Central Government directives on the subject have been ignored by the majority of departments. Of these, State G.O. 1352, dated July 27, 1989, prohibited the administration from shifting unfilled vacancies that were allotted to the S.Cs and the S.Ts to the "open competition" pool; it ordered a special recruitment drive to fill these vacancies. While G.O. 167, dated July 20, 1993, called for a special recruitment drive a second time around in order to clear the backlog, the G.O. dated November 3, 1993 directed heads of departments, chief executive officers of public undertakings and heads of universities to send annual reports to the Department of Adi Dravida and Tribal People's Welfare on the implementation of the S.C.-S.T. reservation system. The administration also ignored two Central G.Os, one of which dates back to 1952 and relates to vacancies that come under the

Relive the sensation

"single posts" category and vacancies that are small in number. The order suggested that in such cases, vacancies of similar grades be grouped together for the purpose of reservation. A 1984 G.O. directed that if qualified hands were not available among the S.C. and S.T. candidates, some of the prescribed qualifications may be relaxed if the candidates were otherwise found suitable. This too was ignored.

The study has found no justification for the general impression that the posts reserved for the S.Cs and the S.Ts remain unfilled for want of qualified candidates.

The study has identified more than 15 departments and posts reserved for the S.Cs and the S.Ts that remain unfilled. The departments include Collegiate Education (posts of principal, professor and lecturer), Technical Education (principal, heads of departments and lecturers), Social Welfare (civil assistant surgeons, Siddha practitioners), the State Secretariat (secretaries of different categories, personal assistants, private secretaries), Revenue (deputy collectors) and universities (professors and readers).

Even the G.O. that requires each department to furnish to the Director of Adi Dravida and Tribal People's Welfare particulars pertaining to S.C. and S.T. employees every year has often been flouted. A reminder from the Chief Secretary and the appointment of a monitoring committee by the government, however, improved the situation.

The level of representation of the S.Cs falls much short of their quota in Category A, the highest in terms of salary and perks, and is, unsurprisingly, slightly above the 18 per cent mark in Category D, the lowest. In the case of the S.Ts, the situation is still worse – their representation is less than the stipulated 1 per cent.

THE study has been hampered by the failure of certain departments, such as the Department of Education and institutions such as aided schools and colleges and local bodies, which together account for over seven lakh posts representing about 50 per cent of the total number of jobs in public services, to send in particulars. Of the 141 government departments, 36 did not provide particulars.

The study reveals how the provision that reservation is applicable only to direct appointment could rob Dalits of their legitimate share in government services. The administration either finds ingenious ways to circumvent existing rules or frames new rules to manipulate direct appointments by limiting them to "substantive vacancies". Even in the case of posts meant for direct appointment, vacancies are sometimes filled through promotion. The appointment of temporary or daily-wage employees and the regularisation of their services later has been a way to by-pass reservation. Filling vacancies with personnel on deputation is yet another means. All this shows how constitutional rights and Directive Principles are sabotaged by using flimsy service rules and regulations.

The study has found no justification for the general impression that the posts reserved for the S.Cs and the S.Ts remain unfilled for want of qualified candidates, except perhaps in the case of some high-level posts. For instance, there are 2,459 engineering graduates belonging to the S.Cs on the live registers of the State's employment exchanges. Nothing could be farther from the truth than the claim that there were no S.C. applicants for the posts of police constables, for which the minimum qualification is a pass in the 10th standard. No proper study has been made of the availability or otherwise of suitable candidates.

Special recruitment drives, detailed advertisements for jobs, reservation in the matter of promotions, direct appointment to additional posts, and an amendment to the provision that reservation is applicable only to groups of 10 vacancies are some of the suggestions that have emerged from the study to clear the backlog of unfilled vacancies. Other suggestions are direct appointment for a minimum of 50 per cent of the posts and continued monitoring of the reservation system.

What the exhaustive exercise undertaken by the government-appointed committee has sought to drive home is the fact that no amount of legislative measures and executive orders can put an end to discrimination against the weaker sections and correct centuries-old distortions and imbalances unless they are backed by the political will to beat back resistance from vested interests in an upper-caste dominated bureaucracy. ■

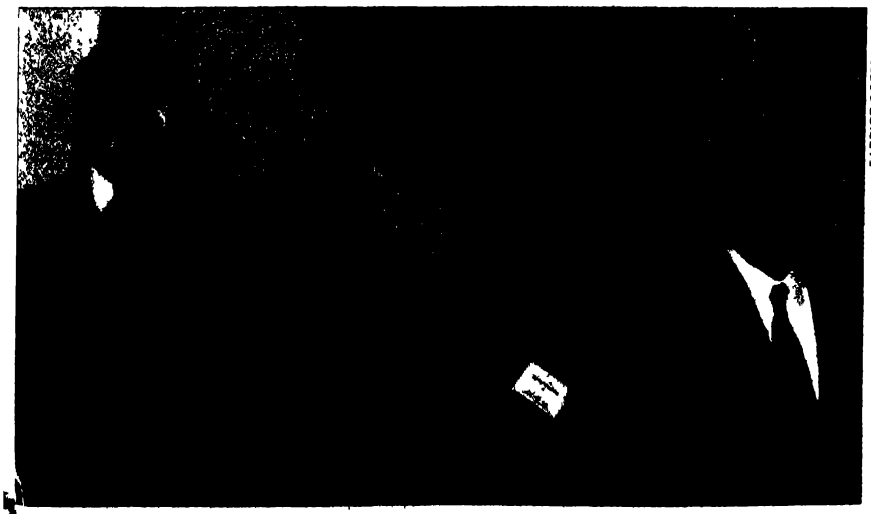
The terms of trade

The battle lines over the agenda in Seattle become clearer, but India's position on many specific issues is

THOMAS ABRAHAM
recently in Lausanne

A TWO-DAY meeting of Trade Ministers from 25 countries including India in the last week of October in Lausanne, Switzerland, failed to agree on an agenda for the Ministerial Conference of the World Trade Organisation (WTO) in Seattle. From the outset it was clear that the arguments on the scope of the negotiations would not be resolved at short order, and the Ministers themselves did little to disguise the fact that they had not succeeded in narrowing their differences.

As WTO members prepare for Seattle, there are numerous differences within the developing countries as well as between the developed and developing countries. The immediately evident disagreement is between the United States, backed by the Cairns group of agricultural produce-exporting countries on the one hand, and Europe and Japan on the other, over the extent to which trade in agriculture should be liberalised.



Earlier this year the U.S. made it clear that it regarded the removal of barriers to its agricultural exports a major goal. Agriculture is one of the most export-dependent sectors of the U.S. economy, and according to one U.S. government estimate, the produce from one out of every three acres is exported. The U.S. is keen to see tariffs on agricultural imports reduced, or even eliminated, worldwide, and wants to negotiate an end to export subsidies and agricultural support programmes in other countries, particularly in the countries of the European Union (E.U.). As U.S. Trade Representative Charlene Barshefsky told a press conference in Washington, during the new round of negotiations the U.S. will seek "very aggressive reform".

TOWARDS SEATTLE

The U.S. argues that subsidised exports from the countries of the E.U. make it difficult for U.S. farm produce to find markets overseas, and that the subsidies and financial support that E.U. farmers enjoy make it difficult for U.S. agricultural produce to compete in Europe. The E.U., on the other hand, is reluctant to negotiate on the kind of radical changes that the U.S. demands. Agriculture is a sensitive subject in the E.U. countries, where farmers are heavily subsidised. They have been strident in their protest whenever subsidies have been under threat. Although the E.U. is committed to the long-term reform of its agricultural price support and subsidy regime, it feels that it cannot make any radical changes within the time-frame that the U.S. expects.

Japan, which also has a protected agricultural system, is unhappy about opening itself up to imports, and is with the E.U. in opposing the U.S. on the issue. The U.S. would like commitments for radical reform to be written into the agenda of Seattle, while the E.U. has said that the extent of liberalisation in agriculture is something to be negotiated there.

Another point of disagreement between the U.S. and the E.U. is over the inclusion of issues such as foreign investment in the agenda. While the E.U. and Japan are keen on having the WTO formulate minimum rules for investment, the U.S. has refused to agree to this. With attempts to negotiate a Multilateral Agreement on Investment (MAI) in the Organisation for Economic Cooperation and Development (OECD) having failed, the E.U. and Japan are keen to use the WTO as a forum to negotiate rules to govern investment.

FABRICE COFFRINI / AP

European Union Commissioner for Trade Pascal Lamy, Swiss Federal Council and Minister for Economic Affairs Pascal Couchepin, U.S. Trade Representative Charlene Barshefsky and Japan's Minister for International Trade and Industry Takeshi Fukaya in Lausanne, Switzerland, on October 25.

BUT there are two crucial non-trade areas on which the U.S. and the E.U. agree, which the developing countries have unitedly opposed: labour standards and the environment. The U.S. and the E.U. are keen to make labour and the environment an integral part of the WTO agenda. They wish to see that countries respect "minimum labour standards" for the goods they export. The U.S. has presented this concern for labour standards as part of its desire to see that the benefits of trade are shared by all, and to ensure that free trade does not lead to the exploitation of labour.

The developing countries, on the other hand, see this concern for the poor as nothing more than an attempt to deprive them of the one area in which they enjoy an advantage over the developed

world – cheap labour. They fear that the West will use this issue as an excuse to erect barriers to their exports. The developing countries have said that labour standards were a matter for the International Labour Organisation (ILO), and that the WTO should have nothing to do with it.

Similarly, on the matter of the environment, the U.S. and the E.U. have said that they wish to bring in rules to ensure that the expansion of trade does not lead to environmental degradation. But the developing countries see this as yet another attempt to bring in protectionism through the back door. Both the U.S. and the E.U. are desperate to include these two non-trade issues on the agenda in some form or another, and it is clear that Seattle will see a major clash on this issue.

RAMESH SHARMA

Commerce and Industry Minister Murasoli Maran.

THE Lausanne meeting enabled India to spell out its own position. Commerce Minister Murasoli Maran, making a foray into the world of multilateral trade, made it clear that India's main objective in Seattle would be to set right the inequities that had become apparent in the implementation of the Uruguay Round.

Maran said: "Some of the Uruguay Round agreements carry built-in imbalances that have come to light even more dramatically during their implementation. Far from favouring the developing countries, they have imposed even more onerous obligations on them." He pointed out that exports from developing countries faced barriers in the form of anti-dumping and subsidy investigations. "Whenever we show competitiveness in some products, trade defence measures, including anti-dumping and subsidy investigations are initiated, effectively crippling our export effort." Maran also spoke of the limited success textile exporting countries had received in their efforts to get the developed countries to lower import restrictions.

India has suggested a number of amendments and changes to the rules with regard to anti-dumping and subsidies as well as an immediate end to barriers to textile exports. The U.S., which has been less than favourable to these proposals, has said that some of them amount to a renegotiation of the Uruguay Round agreements, which it was opposed to. But the E.U. and Japan, whose Trade Ministers Maran met in Lausanne, were more positive with regard to India's concerns. Maran referred to this difference in attitude when he said that India had been "encouraged by the positive response of some countries", but "extremely concerned by the apparently negative attitude taken by others".

The other issue that Maran repeatedly stressed was that India was not going to be "bulldozed" into accepting discussions on labour standards and the environment, or on any issue not directly linked to trade. "We are strongly opposed to non-trade issues which only have tenuous links with trade being brought into the agenda of the WTO."

While the broad thrust of India's position has been set out, it is clear that there are many areas that the government has yet to make up its mind on. For example, the U.S. is keen to put e-commerce on the agenda of the new round in order to ensure that the current practice of having no tariff or other barriers on transactions through the Internet, continues. The U.S. is also keen to extend the existing Information Technology Agreement (ITA).

India has not expressed any strong opposition with regard to these issues, and will in all likelihood use them as bargaining chips in the run-up to Seattle. It is possible to foresee a situation where India agrees to support these issues in the negotiations, in return for U.S. support on matters of implementation. Similarly, India has hinted that it is willing to negotiate reductions on industrial tariffs in return for favourable changes with regard to anti-dumping measures and so on.

Unlike in the case of previous trade negotiations, New Delhi seems determined to seek a political consensus on the issues and also go in for consultations with industry representatives and others concerned before reaching a final decision on its approach to issues in Seattle. As Maran told Indian journalists after the conference, the Government did not want a repeat of what happened during the Uruguay round, when there was little consultation within the country on the issues at stake, and Parliament was presented the final package as a *fait accompli*. ■

■ TRADE ISSUES

BIPLAB DASGUPTA

SOME time in the early 1980s President Ronald Reagan, the champion of a "world without trade barriers", faced a serious dilemma. The U.S. automobile industry, facing severe competition from Japanese car manufacturers and making huge losses, urged the President to impose controls on the import of Japanese cars. If Reagan acceded to the demand it would have meant going against his avowed stand, while a rejection of the demand was certain to ruin the U.S. car manufacturers who were his staunchest political allies and biggest source of funding.

He conferred with his Cabinet colleagues and sought a formula that would help avoid imposing import barriers and at the same time save the domestic car industry from losses. Vice-President George Bush told the President: "We're all for free enterprise, but would any of us find fault if Japan announced, without any request from us, that they were going to *voluntarily* reduce their export of autos to America?" "What a great idea!" everyone in the room chorused. The President was impressed.

Reagan shot off a letter to the Japanese Foreign Minister: "Our Republican administration firmly opposed import quotas but strong sentiment was building in Congress among Democrats to impose them. I don't know whether I would be able to stop them," he said, reflecting the mood of despondency of U.S. car manufacturers. Then followed the great idea: "But I think if you *voluntarily* set a limit on your automobile exports to this country, it would probably head off the bills pending in Congress and there wouldn't be any mandatory quotas."

This was followed by intense diplomatic pressure, at the end of which was born a new type of non-tariff barrier (NTB) which eventually came to be known as the Voluntary Export Restraint (VER) agreement. Japan "voluntarily" agreed not to sell more than a certain number of cars in the U.S. market. On its part, the U.S. refrained from imposing import controls on Japanese cars as the threat of competition and extinction disappeared and controls were no longer felt necessary.[1]

Apparently, the U.S. administration found no conflict between preaching free

1. Ronald Reagan, *An American Life*, Simon & Schuster, New York, 1990, pp. 253-55.

Control through coercion

The rich Western countries may propose non-tariff barriers and other protectionist measures in various guises at the Seattle meeting in order to save their domestic industry from competition.

market competition and practising protectionism, and audaciously describing as voluntary the action taken by its competitors in order to protect its own domestic producers.[2]

BY 1989, 236 VERs had been identified by the General Agreement on Tariffs and Trade (GATT), of which 134 were directed against East Asian countries which were busy "creating comparative advantage" for themselves in sunrise industries – electronics and consumer durables. Sixty of these VERs were in food and agricultural products, 27 in electronic goods and components and 50 in steel produced by competitors.[3] Although the Marrakesh agreement of 1994 is formally opposed to VER, this is a grey area. Fear has been expressed, even by international organisations such as the United Nations Conference on Trade and Development (UNCTAD), that such formal de-recognition would drive VERs underground and informal market-sharing arrangements, which are part of the culture of multinational companies (MNCs), would take their place.[4]

Voluntary Export Restraint is but one example of the kind of trade restriction rich Western countries practise against their competitors. As this brief account shows, trade restrictions aimed at keeping the exports of Japan and Third World countries away from European and U.S. markets took various forms. While GATT argued for a reduction in tariffs, one NTB after another came to be erected in the West, along with heavy doses of subsidies where necessary, which allowed their non-competitive agriculture and textile and other industries to survive.

One such much-talked-about NTB is the multi-fibre arrangement (MFA), which imposes country-wise quota restrictions on Japanese and Third World textile and garment exports. Its origins, as in the case of VER, lie in the fear of Japanese competition: Japan's admission to GATT in 1960 led to a serious threat to the West's out-of-date and inefficient garment and textiles industry. The formal justification for such trade barriers was the fear of disruption of the well-ordered global market (presumably under the hegemony of Westerns MNCs) by cheap sources of supply. The MFA was renewed every three or four years. Beginning with textiles, the MFA extended in due course

TOWARDS SEATTLE

to synthetics, silk blends, vegetable fibres and to almost all kinds of fibre. [5]

While the Marrakesh agreement provides for the winding up of the MFA, such withdrawal, to use GATT/World Trade Organisation (WTO) jargon, has been "back-loaded". That is, unlike the phasing out of withdrawal of restrictions in the case of other commodities, for textiles the pace set would be rather slow as the interests of the rich Western nations are at stake. While 51 per cent of textile imports would be liberalised in three phases in a period of seven years, the liberalisation of the remaining 49 per cent would be postponed until the very last phase, between 2002 and 2005.[6] Further, although five years have passed since the Marrakesh agreement, there has been little visible liberalisation in this area; in fact, in the name of "transitional safeguards" more obstacles have been put in the way of Third World exports. There is widespread fear that at the end of the 10-year period in 2005, the MFA might be extended, given the intensity of lobbying in the U.S. and Europe by their own textile interests.[7]

Even if this fear turns out to be unnecessary and a large slice of the Western textile market does indeed become open to Third World exports, it is not clear how such gain from trade would be distributed among them. It is not known whether India would gain or lose from the disbanding of the MFA. While some people, particularly political figures who represented India at the Uruguay Round of GATT negotiations, are prone to suggest astronomical figures for potential textile exports after 2005, no one has done any respectable econometric study of the possible distribution of gains, particularly the proportion that would accrue to India. Some people even fear that in a no-quota regime India would be worse off as its exports will have to compete with cheaper exports from sources such as Bangladesh and with high-quality products from East Asia and South-East Asia.

While the VER agreement and the MFA were prompted by the desire to protect old and decrepit Western industries that would not survive free global competition, measures such as Voluntary Import Enhancement (VIE) coerced the countries concerned to agree "voluntarily" to provide U.S. and European multinationals access to their markets in diverse fields such as electronics, pharmaceuticals and telecommunications. The country concerned pledged to leave a share of the domestic market in those fields to Western MNCs. In the case of Japan, such market reservations were agreed upon following what came to be known as Structural Impediments Initiative (SII) talks with the U.S.[8] For instance, one-fifth of the Japanese market for semi-conductors was assured for U.S. MNCs. [9]

The U.S. found yet another way of gaining access to the Japanese market, which it could never have achieved by following the logic of free competition. In a desperate bid to reduce its trade deficit with Japan of around $50 billion, the U.S. forced Japan to sign the Plaza Accord in 1985 and the Louvre Accord the following year. These required Japan to overvalue the yen and hence the prices of its

exports. [10]

OTHER trade control measures were taken either to restrain imports or to gain access to the markets of other countries. For instance, Japan was threatened with an anti-dumping suit in 1985; the move was, however, withdrawn when Japan agreed to give 20 per cent of the semi-conductor market to U.S. MNCs.[11] In several cases Super 301 – Section 301 of the U S. Trade Act – was used to pressure the trading partner to agree to a VER. 'Safeguards' against alleged damage to the country's economy caused by imports, which form part of the GATT framework, have been used to evade from GATT obligations.[12] Up to 1993, 151 such safeguard actions were taken, of which 136 were taken by the rich countries [13] Anti-dumping measures have been repeatedly used as protectionist action against cheaper and more efficiently produced foreign articles in the case of steel, automobiles and semi-conductors, or to coerce them to enter into VERs.[14]

One major unintended consequence of VIE and the Plaza Accord was the economic transformation of South-East Asia, particularly Thailand and Malaysia, to which a large amount of Japanese capital moved now. To avoid the quota under the MFA, South Korean capital moved into Bangladesh and established a modern garment industry, which in a short time became the highest foreign exchange earner for that country after direct remittances. In all these cases, control remained firmly in the hands of the East-Asian MNCs; machinery, raw material, technology and management were supplied by them, while the host country contributed its name and supplied unskilled labour.[15]

Super 301 gives the U.S. President the authority to retaliate against a country that harms U.S. commercial interests through "unreasonable" and "unjustifiable" trade practices. What exactly is "unreasonable" or "unjustifiable" is determined by the U.S. The procedure followed resembles the functioning of a criminal court where the government acts as the prosecutor, the judge and the jury, while the 'guilty' party is summoned by declaring their names in a "hit list" prepared under this section. Once the name of a country appears on the "hit list", the former is expected to rectify the offences that form the basis of such summons within a stipulated period of time.[16] Although one major justification for the establishment of the WTO was that such unilateral actions would be forgone and disputes settled multilaterally through the new body, this has not happened. The unilateral Super 301 continues along with the multilateral Dispute Settlement Board of the WTO, the former overriding the latter. The U.S. has passed a law that states explicitly that in case of a conflict between the WTO and U.S. laws, the latter would prevail.[17]

The rich countries of the West are for free trade and competition as long as the outcome is in their favour, but in case of a conflict between the ideals of free trade and their domestic interests they will resort to protectionist measures. Further, they manipulate several GATT and WTO provisions that are ostensibly intended to protect the weak countries, in order to make these provisions work in their favour.

WHAT this shows is that the rich countries of the West are for free trade and competition as long as the outcome is in their favour, but in case of a conflict between the ideals of free trade and their domestic interests they will resort to protectionist measures. Further, they skilfully manipulate several GATT and WTO provisions that are there ostensibly to protect the weak countries, in order to make these provisions work in their favour and against Third World exports. The anti-dumping measures & safeguards constitute an example. In recent years, marine exports from India have been banned in Europe on the grounds of hygiene while the *ghagras* (skirts) of Jaipur have been banned in the U.S. as the fabric is considered inflammable. Rules to decide what is not environment-friendly, what is justified trade restriction, what is fair trade, which subsidies are production- and trade-distorting and so on, are framed with the interests of Western producers in mind. While developed countries are keen to reduce tariff levels for understandable reasons, a similar interest is missing in the case of non-trade barriers that they themselves operate. Even taking tariff alone into account, one finds that while the average level of tariff has been brought down in developed countries, the "peak" tariff rates have remained, particularly in areas in which poor countries are likely to benefit, such as textiles, leather and agro-industrial products.

The rich countries are now asking for a new, millennium round of trade negotiations, in which they are keen to introduce several new topics, such as those relating to the universalisation of investment and competition policies in electronic commerce and government procurement, and of labour and environment standards. Some of these are likely to be discussed at the four-day WTO ministerial-level meeting beginning on November 30 in Seattle. The rich countries are likely to propose NTBs and other protectionist measures in various guises, keeping in view the lack of cohesion and political will among Third World nations. ■

Winding down to Seattle

Although no agreement on an agenda incorporating a new round of negotiations could be arrived at in Lausanne, the idea of such an agenda is winning support even among some developing countries. Will the transition from opposition to acquiescence which led up to the inequities in the Uruguay Round be repeated in Seattle?

C.P. CHANDRASEKHAR

AS the debate on the agenda of the Ministerial Conference of the World Trade Organisation (WTO) in Seattle nears resolution, the discussions appear to be following a course similar to the negotiations which led up to the Uruguay Round agreement. The debate began with most developing countries opposed to an agenda proposing a new round of multilateral trade negotiations. But it is likely to end with a consensus which incorporates such a proposal.

The grounds for developing country opposition to a new round were clear. Agreeing to such a round amounts to transforming the mandated review and renegotiation of the agreements in the contentious areas of agriculture and services into a set of wholly new negotiations with a wholly new agenda.

The developing countries did want the review to be expanded to include an appraisal of the impact of the Uruguay Round on their trade performance and prospects, in order to assess whether the benefits promised from agreements in that round were being realised.

But going beyond this proposal for an extended review to a full-fledged new round does have important implications. To start with, it implies that the fundamental thrust of the next set of negotiations should be further liberalisation in chosen areas, with no review and roll-back of past agreements. Secondly, it signals to the world that what is at stake are not marginal adjustments around Uruguay Round benchmarks, but significant advances in the direction of further liberalisation. Third, it opens the door to the introduction of new areas of negotiation involving linkages between trade and environment issues, trade and labour questions and finally a multilateral agreement on investment.

For the developed countries as a group this offers substantial gains. Principally, it would shift the focus away from the need to redress the obvious imbalances in the Uruguay Round agreement with regard to market access. The evidence is clear (see charts) that the concessions received by

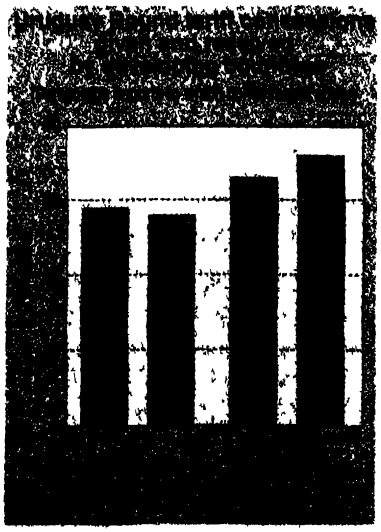
TOWARDS SEATTLE

developing countries in terms of the share of imports over which tariff concessions apply and the depth of the tariff cut they benefited from was lower than that which applied to the developed countries. That is, starting from a position of subordination, developing countries appeared to have offered more in the nature of concessions with regard to market access than the developed countries did.

But even this picture is partial, inasmuch as it does not capture the actual extent of trade liberalisation and the commodity composition of the areas in which the concessions were offered by the two sides. In fact, as a result of the enforced or voluntary pursuit of liberalisation strategies, developing countries have proceeded much further in doing away with non-tariff barriers and reducing tariffs than warranted by the commitments in the Uruguay Round. In the event, the evidence is now overwhelming that both across and within product groups, the developing countries began to *give* virtually immediately after the Uruguay round negotiations were complete, but they are yet to begin to *receive* much by way of benefits in areas that matter to them from an export point of view.

Nothing epitomises this more than the agreement relating to textiles. From the point of view of the developing countries, the most visible and "multilaterally" accepted non-tariff barrier regime prior to the Uruguay Round was the Multi-Fibre Arrangement (MFA). That arrangement was the end-result of a series of negotiated agreements starting in the 1960s, all of which sought to provide the developed countries with the time needed to restructure their industries so that competitive textile exports from lower-cost developing countries do not "disrupt" their markets. Despite three decades of agreement on that principle and periodic revisions of the deadline to end import restrictions, textiles still were by the late-1980s not permitted free entry into developed-country markets. The case for an immediate end to such restrictions, under a new multilateral trade regime, was therefore strong. However,

Chart 1



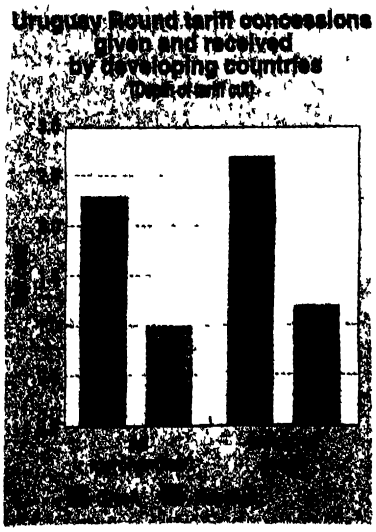


Chart 2

though the Uruguay Round agreement on textiles and clothing provided for the phasing out of restraints stemming from the MFA, it once again diluted and delayed the process of liberalisation. To start with, the agreement was made applicable to all textile imports into developed countries rather than those on which quotas applied at that time. Further, the process which was designed to occur in four stages over a ten-year period was heavily "back-loaded", in the sense that most of the liberalisation was to occur during the final stages. Thus, more than five years after the agreement has been in place, only 33 per cent of imports of four categories of textiles and clothing in 1990 (tops and yarns, fabrics, made-up textile products and clothing) have been rendered quota-free. Quotas on another 18 per cent are to be removed after another two years and on the remaining 49 per cent in 2004.

This prolonged and back-loaded agreement in a labour-intensive area in which the developed countries had agreed to open up markets more than three decades back, points both to the relative positions of power of developed and developing countries in the Uruguay Round negotiations as well as to the extent of commitment of the latter to offer greater market access as a *quid pro quo* for the rapid liberalisation of trade and investment rules in the developing countries.

What is more revealing is the evidence on the progress on this front. With two stages of the phase-out process being complete out of the quotas under MFA that had been notified by the United States, the European Union (E.U.) and Canada, only 1, 7 and 14 per cent respectively have been withdrawn. Much of the phase-out thus far has covered commodities which were not even in consideration. Further, most of these are textile products which do not dominate the developing countries' export basket. Above all, the extent of tariff concessions, both in terms of tariff reduction and the share of the relevant imports subject to cuts, provided by the developing countries have been higher than that provided by the developed countries in industrial products in general and in the textile area in particular. That is, years after the completion of the Round and at a time when talk is already on with regard to initiating a new round, developing-country, market-access "gains" in an area most crucial to them have been minimal.

THE implication of this is obvious enough. Even in an area as basic as market access, what is called for now is a review of the Uruguay Round aimed at redressing the inequalities it carried through in its fine print, rather than an extension of the Round either in the form of more intensive liberalisation or in the form of extending the multilateral framework into new areas. This view would be strengthened if an appraisal is made of the differential impact of agreements on trade-related investment measures and trade-related aspects of intellectual property rights. Evidence of this kind has been marshalled by the developing countries in their submissions to the WTO. By demanding that the next phase of multilateral engagement should not be restricted to a review but extended into a wholly new round, the developed countries are seeking to shift the focus away from these glaring inequalities that have surfaced since the Marrakesh agreement of 1994, and wrest new concessions in wholly new areas.

But that is not all. If the next stage of multilateral engagement is restricted to a review, the focus would be on agriculture, wherein the U.S. and the E.U., particularly the latter, have in practice made minor concessions in the Uruguay Round. By providing their farmers concessions through alternative routes, they have been able to keep the actual average measure of support (AMS) to agriculture above what would be normally permissible under the Uruguay Round. This is the reason why unlike many of the agricultural exporters who are members of the Cairns group, who want more far-reaching liberalisation in agricultural trade, the U.S. and E.U. want non-agricultural commodities brought into the discussion in order to make it more diffused.

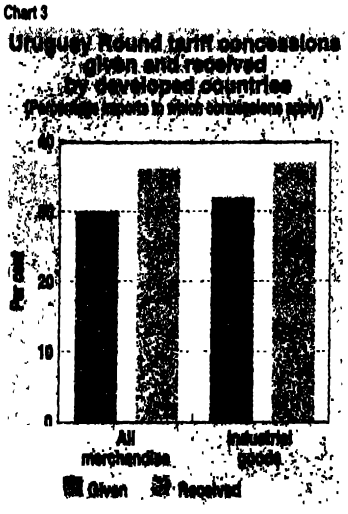
What is more, by bringing in environmental issues, labour standards and social clauses into the negotiations on trade, these developed countries are seeking to win for themselves new protectionist devices which, like the anti-dumping clause under the Uruguay Round, can be used as protectionist devices when and wherever required. Since the standards, if any, set under these heads can never improve upon the current standards in the developed industrial countries, the possibility that such agreements could be used by the developing countries as well does not arise.

Thus, for the developing countries, giving up on the slogan of "standstill, review and, if necessary, roll-back" would be extremely damaging. What is surprising, therefore, is the fact that, though no agreement on an agenda incorporating a new round could be arrived at the pre-Seattle, Lausanne meet, the idea of such an agenda is winning support even among some vocal developing countries. India, for example, has not merely toned down its language and spoken of the need to discuss "implementation issues", but has reportedly turned around to the view that it should not resort to "opposition for opposition's sake". If things take such a turn, the transition from opposition to acquiescence which led up to the inequities in the Uruguay Round would be repeated this time around as well.

On the surface there appears to be no need for the developing countries to succumb to developed country pressures since constitutionally the WTO is an organisation where each member has a vote. The power that the threat of exercising that vote carries was seen in the recent split between the developed and the developing countries over the Director-Generalship of the organisation. The final compromise involves a term of three years each for the two candidates backed by the developed and the developing countries.

Despite this power, the developing countries have gone along with the principle that the contracting parties should

Chart 3



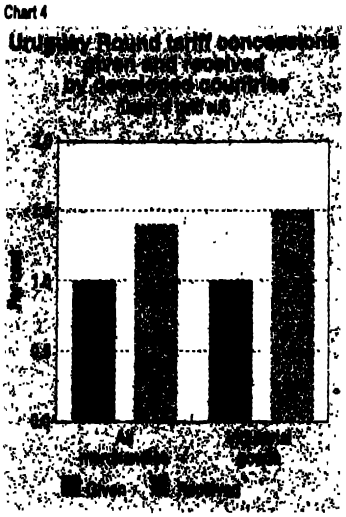


Chart 4

idopt a consensus procedure.

This is partly because decisions rrived at any other way could encourage ndividual developed nations to opt out of the GATT or WTO, and such a devel- pment result in a virtual dismember- ent of that body. Given the dominance of the developed countries over the world trading system and the dependence of the developing countries on the markets of the developed, having the developed countries in was, and remains, crucial for the developing countries. This in itself puts pressure on the developing nations to accept much of what the developed countries propose, in return for small concessions in other areas.

But what matters more is the fact that in the wake of liberalisation in the developing world, most developing countries are keen to attract larger capital flows from the developed countries in the form of aid, debt and foreign investment. This has substantially increased the implicit and explicit cross-conditionality enforced by the developed countries.

Cooperation and support with regard to capital flows requires acceptance of a specific form of trading arrangement. Such cross-conditionality has helped ensure that the developed countries would have their way that much more often. Even when disputes arise, inequality implies that settlement would follow what has been identified as a "power-oriented approach," in which the relative strengths of the parties rather than a set of predefined rules determine the nature of the settlement.

This has one important implication. If developing countries are to prevent the almost continuous erosion of their economic space through formal institutional arrangements at the global level, without receiving much in return by way of trade concessions, they need to rethink their development strategies as well. Only then would they have the manoeuvrability to exercise a right that the voting principle enshrined in the WTO's constitution guarantees. Unfortunately, a change in the trajectory of development is not a possibility by the time of the Seattle Summit. This could influence the outcome of that summit. But a change in strategy is definitely a prospect that could be explored soon during the prolonged negotiations that the Millennium Round would entail, if it is initiated. A change that is significant enough to ensure an outcome from that round which is better than the failed promises of the agreement signed in Marrakesh. ■

India and the world

India's declining influence as a leader of developing countries may reflect not only national and international political economy forces, but also the

THERE was a time – not all that long ago – when India's standing in the international community of nations was very high. This stemmed not only from the obvious reasons such as the size of the population and of the economy and the country's geopolitical significance in Asia. It also reflected the respect India commanded among other developing countries, by virtue of strong and principled stands on a number of international issues as well as what was widely perceived as a genuine desire to forge unity among developing nations as a group. India thus became an important voice for the aspirations of developing countries in general, and a major spokesman in international forums.

This perception was probably strongest during the early and heady days of the Non-Aligned Movement, which reflected the dreams of some remarkable men and women (such as Jawaharlal Nehru, Gamal Abdel Nasser, Josip Tito) as much as those of the governments they led. But even in the 1970s and much of the 1980s, when the political leadership did not display much in terms of an inspiring vision domestically, the foreign policy remained a source of some pride to many Indians and a source of much hope to many in the developing world.

This attribute was perhaps already beginning to unravel by the late 1980s, but in the 1990s it seems to have disappeared altogether. The collapse of the Eastern bloc may have rendered non-alignment meaningless, but it is still difficult to understand why it should also have put paid to attempts by India to forge a common position with other developing countries to protect at least some of their own interests, and made it so completely determined to curry favour with the Western powers.

Since 1998, after the first Bharatiya Janata Party-led government came to power, matters have worsened considerably in this regard, and the combination of going nuclear with the slavish subjugation to the West in matters economic, has meant that India has lost all of that earlier luminosity. Many developing countries are saddened and repelled by what now appears to be a wholly cynical attitude towards nuclear weapons and their control, and the earlier principled positions on the Comprehensive Test Ban Treaty (CTBT) and other issues now sound very hollow. Similarly, the eagerness with which the government has rushed to satisfy the economic interests of the United States in particular, even when they work against the needs of Indian citizens, has reduced any credibility with other developing country governments searching for an alternative path.

Even so, there is still a sense of surprise at the Indian government's reluctance to raise issues at international forums and multilateral negotiations, and also its inability to lobby and gain international support for itself on the rare occasions when it does choose to raise any such issues. Those of us who are outside officialdom and the actual negotiating process have tended to see this as a reflection of either the specific positions held or the result of international political economy forces. But there may be a case for supposing that there is also a negative role played by the way in which our government's representatives conduct themselves at such negotiations.

PREOCCUPATIONS

JAYATI GHOSH

Such reflections emerge from only one particular instance, and may not be generalisable. But if it is part of a more widespread pattern of behaviour, then it may not be surprising that India finds itself so unpopular at international gatherings of nations.

The occasion in question was a meeting in Bangkok called by some United Nations agencies, to review the progress (if any) in the condition of women

across Asia and the Pacific after the Beijing Platform for Action in 1995 Governments of the region were represented (often as in India's case quite heavily) as were other independent academics and activists and members of what are now loosely called civil society organisations The meeting was concerned with various macro issues which have affected the condition of women, as well as the effectiveness of specific measures directed at improving these conditions

As in many such meetings, a statement was proposed to be brought out at the end of the deliberations summarising the discussions and setting forth the main agenda for the future in terms of the measures required of governments and other agents And again as in many other meetings, the statement itself tended to absorb a huge amount of time and effort on the part of a drafting committee" which contained members of all the official delegations This group took the better part of two days and a night to reach a consensus draft report on the proceedings

When the draft – a lengthy 35 page document – was finally presented, at a late hour to a tired plenary group, it was found to cover much ground, ranging from issues of women's employment poverty and illiteracy to violence and political participation There was the recognition that attempts to improve the condition of women through specific legislation and schemes could be and were being undermined by macroeconomic processes (essentially capital mobility which reduces the bargaining power of all workers and creates unstable economic conditions in individual countries) which work in the opposite direction

By then it would seem as if differences would have been ironed out in the long process of discussion in the drafting committee But at the final plenary session the Indian delegation decided to start raising objections These objections did not relate to some of the more pressing concerns of the Indian people – or Indian women which various non-governmental organisations (NGOs) and individuals had specifically requested the delegation to take up Thus, the issue that was raised did not relate to the more problematic implications of the Trade Related Aspects of Intellectual Property Rights (TRIPS) document for the Indian people, or the food security issues which impact directly on women, or any such vital matter.

Instead, the Indian delegation chose to hold up proceedings for a considerable length of time – and in the process alienate almost everyone else present – on the following sentence: "The right of self-determination of all peoples as enunciated in the Vienna Declaration and Programme of Action should be considered, and where appropriate, accelerated" The Indian delegation demanded that the last phrase be removed, others pointed out that they had already agreed to it in the drafting committee, they then responded by suggesting that the proceedings of the drafting committee had not been conducted properly and they were not aware of this sentence Despite the evident resentment their statements caused, there was no attempt at gracefully withdrawing at any point, nor did they seem to recognise that any potential problem with the formulation (as in the possible implications for Kashmir) was taken care of by the safety clause where appropriate"

For someone new to such proceedings, what was especially disturbing was not just the ham-handed manner in which the official Indian responses were expressed, but also the reactions of other country delegations and independent observers These ranged from irritation and resentment over the fact that the proceedings were held up on such a matter to amusement Apparently, according to the representatives of several other countries, such behaviour on the part of Indian delegations is nothing new and in fact they are well-known for their ability to filibuster and fuss over what are relatively minor issues in the broader context of such meetings

What was the message that got sent out to all the delegations representing 43 countries in Asia and the Pacific, including the many small countries and island-states for whom the issue of self-determination has been and continues to be a major element in their current struggle against imperialism? The message that certainly came across to them – and was discussed all over in the hall – is that the only thing which seems to get the Indian official delegation excited is the need to prevent the right to self-determination of peoples

In conferences like this one, the emphasis should surely be on the important issues at hand, and the interventions should reflect a certain expertise and concern, rather than focus entirely on knee-jerk reactions on matters which are at best marginal to the substantive matter under discussion All this may not be so important given the host of other issues which plague our government and people today But this insignificant episode does point to an official failure to do the proper homework, define priorities according to the state of the national debate, and conduct oneself in a manner which evokes respect and sympathy rather than unnecessary hostility and ridicule. ■

BEYOND THE OBVIOUS

PRAFUL BIDWAI

As more details come in of the terrible human tragedy and extensive devastation wreaked by the "super cyclone" on coastal Orissa, it becomes apparent that what we have on our hands is not just a natural calamity, but a *social catastrophe* compounded by administrative failure and political ineptitude coupled with callousness The catastrophe has reduced human existence to hellish conditions, sending man and beast alike foraging for food, and often to the same funeral pyre Thousands of people perished not just because nature vented its fury in an exceptionally savage way, but because society failed to heed the warnings, and then to prepare itself through preventive, remedial and ameliorative action There are many lessons for public policy in the cyclone and its aftermath But just consider this

★ Meteorologists had warned four days earlier of the build-up of cyclonic circulation east of the Andamans, which was gathering monstrous energy But the authorities just sat and watched rather than prepare and implement preventive and evacuation plans Meanwhile, with each day, the cyclone system picked up lethal momentum before hitting the coast.

★ All India Radio and Doordarshan did broadcast cyclone warnings, but these were delivered in such technology-overdosed, obscure, and Sanskrit-laden language that they were not understood by the most vulnerable people and those at greatest risk. fisherfolk and port workers, and those living in shantytowns and flimsy houses.

★ The first casualty of the cyclone was the official disaster management and relief system itself. The telephone lines of all the high officials went dead. Orissa's capital

Not by high-tech alone

An obsession with high technology gadgets and failure to ensure popular involvement in disaster management prevented the officialdom from really helping the cyclone victims.

was cut off Even 48 hours later, only two telephone lines were working – in the Chief Minister's house, and hence of little use to the outside world

★ The authorities' first response was to procure and rely on high-technology gadgets, such as satellite phones, helicopters and remote-sensing imagery Most of these entirely failed – for instance, due to inclement" weather (what else did they expect?) – or caused long delays, without yielding good results What worked was good-old Hams or amateur radio communicators, robust Second World War vintage walkie-talkies and old-style high clearance trucks and heavy vehicles

★ The Army's eastern infantry units were in a state of readiness since October 25 to provide alternative communication (especially road) links and relief But they got their movement orders only after disaster struck on October 29 Their mobility was cramped

★ One of the biggest failures was that of the very agency that is meant to manage catastrophes and coordinate relief operations, namely, the National Disaster Management Division, a full-fledged cell of the Ministry of Agriculture. It first proved totally clueless, then panicked, and later became totally incommunicado Its control room complained all lines are down, there are no satellite pictures owing to heavy cloud cover, there is no power, we are helpless This compounds an already tainted record A recent report from the Comptroller and Auditor-General documents that as much as Rs 670 crores of the Calamity Relief Fund was misused during 1995-98

AS the officialdom bungled, and Ministers and politicians whirred around (seemingly importantly but really without any purpose) in helicopters, people drowned and choked to death, cattle were swept away by 260-kmph winds, boats capsized, the port of Paradeep – one of India s five busiest ports, which handles 25 million tonnes a year – went under, over 15 million people became homeless and many more had to go without drinking water, even food Chaos and mayhem raged in the ghost towns of Orissa Order collapsed amidst widespread looting of food by the starving people The official relief operation was shamefully meagre in scale, painfully slow in starting, callous and inconsiderate in its planning, and badly targeted, and blind to the needs of the poor Four days into the disaster, nothing betrayed official ineptitude more than the fact that the first relief train was dispatched not from Orissa, or any of the States bordering it, but from Delhi!

IT would not do to plead that the catastrophe in Orissa was unavoidable because it was caused by a natural calamity beyond control, or that the eastern coast is especially vulnerable to cyclones about which nothing can be done This argument misses two points India, or South Asia, is not uniquely susceptible to natural calamities Nor are natural disasters socially neutral in their effects They pick on the poor and the weak To take the first point, the United States and Europe are also prone to disasters such as earthquakes And yet, according to the environmental research group Earthscan earthquakes killing more than 10,000 people have only occurred in the Third World Similar hurricanes regularly hit the east coast of the U S , but their toll is infinitesimally smaller than in India, Bangladesh or the Philippines

For instance, the average Japanese disaster kills 63 people But in Peru the average toll is 2,900 At the same time as the Latur earthquake in Maharashtra, California experienced a quake of magnitude 7 4 (Richter scale), which was 100 times more powerful than the Indian event While entire families were wiped out in Maharashtra, only one person died in California When Hurricane Elena hit the U S in 1985, only five people died But when a cyclone slammed Bangladesh in 1991, half a million people were killed

The U.S. is as susceptible to severe cyclones as India's eastern coast. Each year, 10 major tropical storms (of which six become hurricanes) develop over the Atlantic, the Caribbean, and the Gulf of Mexico An average of five strike the U S coastline

SUSI ANTA PATRONOB SH

Victims of the cyclone trudging their way to safety.

every three years. Of these five, two hurricanes are major ones. But government agencies, rescue and relief organisations, and the news media launch a huge warning and preparedness effort. The airwaves are flooded with detailed advice on how to face impending emergencies.

Information is frequently updated and people are asked to stock provisions and medicines, and given emergency service numbers. In the global South, information about emergency plans is withheld from the public.

The vast majority who die in "natural" disasters are the Third World's poor. They perish not because of the intrinsically deadlier nature of the calamity, but because they are socially and physically vulnerable.

The vast majority who die in "natural" disasters are the Third World's poor. They perish not because of the intrinsically deadlier nature of the calamity itself, but because they are socially and physically vulnerable – being forced to live in congested, overcrowded and unsafe conditions in dangerous areas. Their suffering is avoidably greater because the medical and relief infrastructure is hopelessly inadequate and usually the first to crumble under the impact of a calamity. Above all, the authorities' planning of emergency relief provision – especially of absolute necessities such as shelter, food and water – is appallingly bad. It is this, rather than the absolute, intrinsic, severity of a cyclone or earthquake or a tidal wave that explains why human life is wantonly lost, why the poor suffer the most. The scale of damage, whether social, physical or environmental, is *socially* determined.

IN the case of India, the magnitude of such devastation has increased roughly three- to eight-fold over the past three decades. This increase has little to do with growing population or congestion. Rather, it is explained by other *social* phenomena, especially three factors: the tampering with and erosion of natural or physical protective "barriers"; the growing search for, and obsession with, high-technology quick-fixes to social problems; and the increasing inefficiency of relief provision amidst social callousness and apathy.

First, excessive human activity right along the coastline has led to the destruction of mangroves and hardy natural vegetation, including shrubs, that could slow down hurricane-speed winds and bind the soil. This is especially true where predatory activity is promoted, often in breach of the Coastal Zone Regulations – for example, commercial-scale prawn cultivation. At another level, there is the growing phenomenon of dam-induced seismicity, which too makes us more earthquake-prone.

Second, rather than rely on simple, easy-to-use, commonsense-oriented and accessible methods and devices, our administrators have developed a peculiar fascination for sophisticated, electronics-dependent, complicated systems that need expertise and special attention.

Thus, the India Meteorological Department got everything right with sophisticated weather satellites and computer weather modelling. But its much-neglected land communication lines simply did not work. These are vital to its ability to transmit data to the regional units where the action is. Our scientocrats have evidently paid little attention to the simple, the terrestrial, the down-to-earth, the familiar, the easy – as distinct from the sophisticated, the ethereal, the celestial, the exotic. After the Kandla cyclone last year, the government commissioned a report for disaster preparedness, which emphasised satellite phones, high-resolution satellite imagery, expensive big cranes. (Many of our highways and culverts are not wide or strong enough to transport heavy equipment.) These would be welcome if they can be relied upon. That rarely happens. In any case, they cannot be a *substitute* for something far simpler.

An example is cyclone shelters: rugged, simple, two- or three-storeyed structures that can withstand 300 kmph winds and tidal waves, where people can take refuge, and where emergency food and water rations can be stored. These inexpensive shelters have saved tens of thousands of lives in Tamil Nadu and Andhra Pradesh since the 1980s, and many more even in Bangladesh in the last few years. Orissa has hardly any of these. Nor has the government invested in simple, cheap AM or FM radio sets – to be provided at a nominal cost to fisherfolk. Providing each sub-divisional tehsil/taluk town with decent fire-engines and rugged all-weather high-clearance vehicles will probably be far more cost-effective, and in absolute terms much cheaper, than buying a $5-million helicopter.

People are the most crucial input in relief provision and in disaster planning and management. If the local population is allowed and encouraged to participate in such programmes, their success rate would rise dramatically. Indeed, their inputs in planning and in actual implementation are ultimately vital. But that is where the third factor comes in: the officialdom would much rather bypass the people in whose name and for whose benefit it is supposed to work. Having inherited and fully internalised hierarchical and casteist attitudes, it is fundamentally hostile to popular involvement, participation and ownership of disaster management programmes.

Nor are our political leaders and bureaucrats, especially the latter, answerable to the public in a transparent way which really pins responsibility on them and punishes them for non-performance, while rewarding helpful conduct. This, coupled with our generally poor culture of safety, which too absolves the guilty of responsibility, makes for high levels of inefficiency and poor performance.

If there is one undeniable fact about our officialdom, it is that it has got corrupted to a point where its sense of obligation and duty to the public stands seriously compromised. Such people cannot be asked or expected to be sensitive, genuinely empathetic and compassionate to ordinary, poor, citizens, especially those in acute distress. It would be far-fetched to imagine their being sensitive to such things as the need for psychological counselling and kind behaviour – something that is now part of what is considered normal relief provision even in a relatively callous Western society like the U.S.

The forms of behaviour involved here too are socially determined. They directly affect the extent of damage and distress that people suffer. It is futile to indulge in breast-beating about whether the Orissa cyclone was grade seven or eight in intensity. Rather, we must treat it as a national emergency at least on a par with, if not greater than, the Kargil War, and mobilise an all-out effort to help the cyclone-affected. The primary focus must be on *public action*, on getting the government to deliver relief, to learn, to reform its conduct, to involve people, and to perform a socially useful function which is basically irreplaceable. If we succeed even to a small extent in this, the suffering of the people of Orissa will not have been in vain. ■

Silent on initiatives

The President's address on behalf of the National Democratic Alliance Government largely reiterates the economic policy positions common to the governments of the 1990s.

VENKATESH ATHREYA

PRESIDENT K.R. Narayanan's address to the joint session of Parliament on October 25 on behalf of the National Democratic Alliance (NDA) Government, while running along predictable lines, fails to address crucial economic issues confronting the nation. It smacks of complacency in relation to several elements of the economic crisis facing the country, and where it announces policy initiatives, it appears to be extremely anxious to please global financial interests and their domestic counterparts.

Consider, for example, the references to the rate of inflation and the level of foreign exchange reserves. The President's address states, with an obvious air of satisfaction: "Inflation, as measured by the wholesale price index, is around two per cent, which is the lowest in the last two decades." This is a misleading statement. First, a point-to-point measure of inflation is amenable to of easy manipulation through appropriate choice of points in time. Secondly, for the financial year 1998-99, while the wholesale price index (WPI) rose by 6.8 per cent (and *not* 2 per cent), the consumer price index (CPI) rose by 13.2 per cent in the case of industrial workers and by 11 per cent in the case of agricultural workers. If one takes the 1990s as a whole, the annual rate of inflation as measured by the WPI itself is around 9 per cent, and with increasing dissonance between the WPI and the CPI, the annual rate of increase of the CPI has been in double digits. Further, as a result of the recent price increases, the rate of inflation is bound to increase sharply in the coming months. The President's address glosses over the looming threat of rapid inflation with a complacent reference to a point-to-point figure of increase in the WPI.

With reference to foreign exchange reserves, the President's address states how, despite "...an adverse global economic environment last year, our balance of payments position has remained comfortable and our foreign exchange reserves are at a record level of nearly $33 billion." This "achievement", as the address refers to it, needs to be seen in the proper perspective. A substantial proportion of this consists of portfolio investments, which can be withdrawn at short notice in response to changes in the stock markets and prospects of financial gain elsewhere in the world.

Another portion consists of external debt, including money held in foreign currency accounts in India by non-resident Indians. In fact, as Arun Ghosh pointed out, as of March 1999, India's total "vulnerable external liabilities" (as per the classification of the Centre for Monitoring Indian Economy) amounted to a total of $35.8 billion as against the reserves then of $30 billion ("The Macroeconomic Scenario" in *The Indian Economy 1998-99: An Alternative Survey*, Delhi Science Forum, New Delhi, 1999).

Given the fragile and footloose nature of both foreign portfolio investment flows and NRI deposits, as also the uncertainties of private transfers from expatriate Indian workers abroad, the underlying fundamentals of our balance of payments situation hardly provide room for self-congratulation or complacency. On the contrary, given that for all but two years in the 1990s, imports have grown faster than exports, our trade deficit has been steadily widening. In such a scenario, the policy implication is the opposite of trade liberalisation and financial integration into the global economy.

What is really at issue is the presumed "consensus" on economic issues – essentially a consensus manufactured with considerable and generous assistance from the print and electronic media. This "consensus" argues that India's economy will thrive only through rapid implementation of a so-called second generation of reforms beginning with a further opening up and privatisation of the financial sector, including the insurance industry, and across-the-board disinvestment and privatisation of public sector undertakings (PSUs). It is predicated upon the "mantra" of a target inflow of $10 billion of foreign investment every year. It envisages a major presence of foreign capital in key sectors of the Indian economy, such as oil, power, telecommunications, banking and insurance. It takes as incontestable

V SUDERSHAN

President K.R. Narayanan, along with Vice-President Krishan Kant, Prime Minister A.B. Vajpayee, Lok Sabha Speaker G.M.C. Balayogi and Parliamentary Affairs Minister Pramod Mahajan, on his way to the Central Hall of Parliament where he addressed the joint session on October 25.

a considerably diminished role for the government in the economy and implies (although this would be explicitly denied for obvious political reasons) further decline in public provisioning, whether in health and education or through the public distribution system

The President's address states "Generation transmission and distribution of electricity will be unbundled as separate activities, tariff reform, privatisation of transmission and distribution of power, and setting up of state electricity regulatory commissions will be accelerated"

The experience with independent power producers in the private sector throughout the 1990s, starting with Enron, demonstrates what a disastrous course this is As Probir Purkayastha, an expert on the power industry, had pointed out, this route will lead not only to inordinately high costs of power, but also to industry opting for captive power generation, making power even more expensive for those using state-supplied power – mainly domestic and agricultural consumers

The President's address talks of "speedier restructuring and disinvestment of public sector undertakings, including strategic sales" The logic of PSU disinvestment is nowhere spelt out In fact, the economic agents most likely to pick up PSU shares will be cash-rich multinational corporations Thus, apart from the fact that in the current state the stock market is in, PSU disinvestment would imply sales of equity at unconscionably low prices, the process will also lead to strategic sectors of our economy being controlled by large foreign capital

Further, the sale of public sector equity has been used mainly to show a lower figure for that IMF-World Bank sacred cow, the fiscal deficit A policy framework characterised by a refusal to tax the well-to-do, and by the financing of government expenditures increasingly through market borrowings, naturally leads to a steady increase in committed expenditure by way of interest payments on past debt Selling public sector equity is hardly the solution to this problem. By seeking speedier disinvestment of PSUs, the government is surely barking up the wrong tree.

At a broader level of argument, as C.P Chandrasekhar has pointed out, the policy framework of "liberalisation, privatisation and globalisation", or LPG for short, assumes that LPG automatically improves growth performance, an assumption decisively disproved by the experience of the Indian economy during the 1990s, as well as by the experience of several Latin American countries during the period since the 1980s Such a view is not only a throwback to pre-Keynesian ideology which ignores the role of demand, but "completely forgets the importance of state investment and production, especially in the infrastructure industries in affecting the conditions of supply (C P Chandrasekhar, "Industry", in *The Indian Economy 1998-99 An Alternative Survey*)

A PARTICULARLY disastrous policy initiative of the NDA Government is the decision to push through the opening up of the insurance industry in the name of competition This approach ignores the important role the nationalised insurance industry has played in building a self-reliant economy and bringing together for purposeful public deployment vast sums of widely scattered small savings, while providing small savers an important service Interestingly, in 1995, the Rajya Sabha Petitions Committee, chaired by the then Bharatiya Janata Party Member of Parliament Sushma Swaraj, recommended that the General Insurance Corporation be not privatised The committees made this recommendation after examining the experiences with private insurance business and the performance of the public sector insurance industry The move to privatise the insurance industry, which is not warranted even in terms of World Trade Organisation obligations, is being pushed mainly by foreign capital and domestic policymakers who argue falsely that such an opening up will bring in considerable amounts of capital which can be utilised for infrastructure investment

The orchestrated demand for the privatisation of nationalised banks – indirectly alluded to in the President's address in terms of "Reform of banks and financial institutions" – is similarly misplaced The factors leading to the present crisis in terms of non-performing assets of the banking system are not discussed in a transparent manner at all. Several years ago, under pressure from the Left parties, the then Finance Minister, Manmohan Singh, promised in Parliament to make public a comprehensive list of defaulters responsible for the burden of bad debt. The list – which is rumoured to include several luminaries of the corporate world – has not been made public. Pursuance of the Narasimham Committee recommendations – mercifully thwarted partially by the might of the bank officers' and employees' unions – has meant a decline in priority lending and creeping de nationalisation (in the twin sense of both *private* and *foreign*) Thus, not many people are aware that India's largest bank, State Bank of India, has 45 per cent of its shares owned privately, of which a quarter is with foreign owners

The President's address states that "the new Telecom Policy – 1999 shall be expeditiously implemented to achieve the objective of providing universal access to world-class telecom services at the lowest possible price to the public" But this is hardly likely to be achieved, given the nature of the policy which aims at providing a much larger space for private players, and given the role of the Telecom Regulatory Authority of India (TRAI), which seems hell-bent on stifling government and public sector telecom entities such as the Department of Telecommunications (DoT) and Mahanagar Telephone Nigam Limited (MTNL) Ironically, the address talks of strengthening TRAI to "create a level-playing field between public and private operators by suitably amending the TRAI Act' This sounds truly ominous, given the TRAI's tender concern for private telecom operators to the point where lower charges proposed by telecom PSUs for cellular telephony are seen as attempts to eliminate competition through cross-subsidisation

FINALLY, there is the obsession with foreign direct investment (FDI) The President's address repeats the P Chidambaram-Murasoli Maran-Yashwant Sinha mantra of creating "an enabling policy to ensure FDI inflow of at least $10 billion annually" What has been the record since 1991? Between 1991-92 and 1997-98, the total inflow of FDI was just $9 8 billion, as against inflow of portfolio investment of $15 3 billion. According to the 1999 World Investment Report (WIR), FDI inflows to India declined in 1998 to $2 26 billion. During the current year, the figure is expected to touch $3 5 billion. Thus, talk of $10 billion FDI per annum sounds like a lot of hot air More important, we need to have clear priorities on where and why we need FDI. Globally, the dominant mode of capital flows today is that of footloose finance capital constantly in search of high short-term returns. If India really needs to attract FDI on a large scale, we need national policies to increase social sector investments and ensure basic health,

nutrition and education through public provisioning.

When the decision to go in for structural adjustment *a la* the World Bank was taken in 1991, the reasons cited were the fiscal crisis and the balance of payments crisis. Nearly a decade later, neither crisis seems to have been fundamentally resolved. Behind the apparently comfortable foreign exchange reserves position lies a widening trade deficit, compensated mostly by capital inflows of a volatile nature. The fiscal crisis shows no signs of abating, with revenue deficits being even higher than at the start of the reforms – an unsurprising outcome, given the huge tax concessions given to the rich, and the mounting interest burden caused by government borrowing in lieu of taxation. On this count alone the "reforms" can be called into question. But the President's address complacently assumed the validity of the reforms process. An equally disastrous aspect of performance during the reform period pertains to agriculture. Despite 10 successive good monsoons, agricultural growth has been dismal. The annual compound rate of growth of foodgrains output has fallen behind the rate of growth of population, resulting in a decline in per capita foodgrain output, and portending an emerging crisis of food security. But this issue does not even find a serious mention in the President's address.

While the President's address has thus largely reiterated the economic policy positions that are unfortunately common to the Congress(I), BJP and United Front governments of the 1990s so far, it has been silent on badly needed initiatives. With considerable food stocks – itself a reflection, in part, of widespread rural impoverishment – and a large surplus pool of labour in the rural economy, one can make a strong case for public works executed with transparency through elected local bodies. If appropriately designed, such a programme can help build valuable productive assets for the rural economy. Together with genuine land reforms, it can help expand the home market and stimulate growth. Strengthening infrastructure – industrial and social – through public investment financed by taxing the well-to-do, is a far more important priority than is currently perceived by policymakers. Finally, policymakers must re-strategise India's response to the pressures and processes of the international economy, and develop an agenda for the WTO meet in Seattle, around which the broadest coalition of developing countries can be united. ■

Tariff trouble

The Delhi High Court stays TRAI's 'calling party pays' regime as petitioners object to its revenue-sharing arrangement.

SUDHA MAHALINGAM

THE 'calling party pays' (CPP) regime, which seeks to make the fixed-line subscriber cross-subsidise the mobile phone system every time he or she calls a cellular number, failed to take off on November 1, as the Delhi High Court stayed its implementation. In a desperate, last-minute attempt to enforce the regime, the Telecom Regulatory Authority of India (TRAI) petitioned Chief Justice A.S. Anand of the Supreme Court to vacate the stay. The court refused to entertain the prayer. Further hearings by the Delhi High Court on two petitions, one by the public sector Mahanagar Telephone Nigam Limited (MTNL) and the other, a public interest petition moved by Telecom Watchdog, a consumer organisation, will take place on November 16.

The stay, granted on the plea of Telecom Watchdog, appears to have created some confusion as to whether another order of TRAI, on the downward revision of rental and call charges from November 1 for cellular phone subscribers consequent on the migration to the revenue-sharing regime, was also put on hold.

S. Rajagopalan, Chairman and Managing Director of MTNL, told *Frontline* that only the operation of the Telecommunications Interconnection (charges and revenue-sharing – First Amendment) Regulation, 1999, dealing with the CPP regime and the interconnection arrangements of such a regime, had been stayed. The Telecommunications Tariff (Fifth Amendment) Order of 1999, which dealt with the revision of rentals and call charges for cellular phone subscribers, however, took effect on November 1. Telecom industry sources say that the confusion may not be all that innocuous. Clubbing the two issues was likely to turn the anger of cellular subscribers against MTNL.

The CPP regime was patently iniquitous. It not only sought to provide free incoming calls to cellular subscribers, but went on to propose that the resultant loss of revenue to the cellular operator be compensated by the fixed-line users calling cellular numbers. Had the CPP regime come into force, fixed line subscribers calling cellular numbers would have paid tariffs ranging from 200 to 400 per cent of ordinary call charges, depending on the duration of the call. This is iniquitous in itself since cellular phone subscribers are generally affluent and in many cases their bills are picked up by their businesses. Worse still, the CPP made it incumbent upon the fixed-line operator to collect the tariffs from its subscribers calling cellular phones and pass on as much as 72.7 per cent of them to the cellular operator in whose network the call terminated. Compare this with the maximum of 23 per cent of revenues passed on to the fixed-line operator by a cellular phone operator when a cellular call terminates in a fixed line. In fact, this share is further reduced to 9 per cent in the case of calls lasting more than 120 seconds, but up to 180 seconds.

The foremost casualty of such asymmetry would have been the Department of Telecom Services (DoTS) which provides basic telephony throughout the country and MTNL, which provides basic telephony in Delhi and Mumbai. It is estimated that DoTS and MTNL will together lose around Rs.320 crores annually. A substantial chunk of the loss would have gone to private cellular phone operators.

Even so, MTNL would not have taken the extreme step of approaching the courts, Rajagopalan said. "In principle, we are not against the CPP regime. What we object to is the skewed revenue-sharing arrangement," he said. In its petition, MTNL alleges that the telecom regulator exhibited extraordinary haste in announcing the scheme, even without considering the objections raised by it. Pointing out the asymmetry in the revenue-sharing arrangement, it has stated that under the TRAI Act it is illegal to impose on MTNL the obligation to collect revenues from its subscribers who make calls to cellular phones and share them with cellular operators. The petition says: "The respondent is seeking to bind the Petitioner with legal

obligations, *inter alia*, of collecting the revenues from their consumers and passing the same to the said Cellular Service Providers. It is further submitted that such legal obligations could not have been imposed by the Respondent in exercise of its powers under Sections 11(2) of the Act. Assuming it could be done, the same should have been done only after considering the objections/comments of the Petitioner and also after complying with the principle of natural justice by hearing the Petitioner."

The CPP regime was patently iniquitous, and the foremost casualty of the asymmetry it would have entailed would have been the Department of Telecom Services and MTNL.

Rajagopalan further said that under the CPP regime, when MTNL subscribers who made calls to cellular numbers defaulted on their payments, the company would have to pay the cellular operators' share.

The MTNL petition has drawn the High Court's attention to the fact that it has enormous social and universal service obligations and therefore cannot be compelled function as collectors of revenue on behalf of cellular service providers at the cost of basic service consumers and of the tax-paying public. If the CPP regime comes into being, MTNL will have to invest in revamping its metering and billing infrastructure and additionally provide barring facility to those subscribers who do not wish to avail themselves of the facility to call a cellular phone. It will have to invest in area such as upgradation of exchanges, installation of new switches in exchanges that cannot be upgraded, and upgradation of systems software.

Rajagopalan said that many of MTNL's subscribers, who limited their calls to the minimum free calls available to them, also called cellular numbers. "The current rental does not even meet our fixed costs but still we provide them a certain minimum number of free calls. The CPP will force us to pay cellular operators for calls made by this category of subscribers. This is not such a small number," he said. In such cases, although MTNL collected no tariff, it would still have to pay the cellular operators' share. This, he said, would result in substantial transfer of MTNL's resources to private cellular operators.

The petition also points out that charging hefty tariffs for calls made from Packet Switched Telephone Network (PSTN) lines to cellular phones will not encourage the use of telephone services. (In its consultation paper on Telecom policy, TRAI had justified the CPP regime on the ground that it would improve cellular phone use.) The MTNL's petition said that while announcing the introduction of the CPP regime, TRAI had failed to take into account the revenue-sharing arrangement for the following types of calls: a) Cellular to cellular local call in the same service area via MTNL; b) Cellular to cellular long-distance call via MTNL; c) PSTN long-distance call to cellular phones; d) Local and long-distance PSTN calls from Private Basic Service Operator to Cellular Network via MTNL; e) Incoming international calls to cellular phones via MTNL; and f) GMPCS calls to the cellular network via MTNL. The petition also points out that these account for substantial segments of the terminating traffic to the cellular network and will affect the revenues of MTNL if they are not worked out properly. It further says callers using coinbox phones will not be able to access cellular phones if the CPP regime comes into being.

Telecom Watchdog had prayed for an *ex-parte* stay on the implementation of the CPP regime on the grounds that the CPP tariffs were arbitrary and that they entailed a loss of Rs.320 crores a year to the exchequer. The petitioner also pointed out that the CPP tariffs differed from those proposed in the consultation paper, to the detriment of the basic phone subscriber and operator. The petitioner also alleged that the open house session held by TRAI on the CPP issue did not offer adequate opportunity for consumers to air their viewpoints and that TRAI had failed to educate consumers about the implications of the CPP regime. It has alleged that TRAI showed undue haste in announcing the CPP regime, which has implications for more than two crore basic telephone subscribers, and that the decision lacked transparency. The petitioner also pointed out that the CPP regime militates against National Telecom Policy (NTP) 1994 and NTP 1999, which promise increased teledensity at affordable rates. ■

Pakistan

This has reference to the Cover Story "Back in business" (November 19). Foreign powers such as the U.S. and Britain and the Commonwealth have brought pressure on the military regime in Pakistan to reintroduce democratic rule. But they forget the fact that such pressure amounts to interference in Pakistan's internal affairs.

After all, democracy is not an end in itself. Democracy could also fail when corrupt, self-serving and incompetent politicians come to wield power and create an urge in the people for a "spell of non-democratic rule" that could correct the evils of misgovernance. The fact that the coup in Pakistan was "bloodless" could be an indication of such a desire. What people want is good governance and to them it does not matter whether power is wielded by politicians or generals.

Diesel price

"The burden of diesel price" (November 19) is certainly going to be felt for a long time. While any increase in oil prices takes effect quickly, the customer hardly hears about prices being reduced.

What is surprising is the lack of interest or initiative to conserve petroleum products, which are scarce. With better coordination between rail and road transport services, the need for trucks can be eliminated except in regions without a rail link. Diesel is also wasted when buses are operated between towns that have a rail link. If the frequency of train services is increased, the number of bus services can be reduced.

Courts and freedoms

Anupam Gupta has objected to the terminology 'courts of inquiry' ("Of courts and freedoms", November 19). When an inquiry is carried out by a single officer, it is called formal investigation under a set procedure. It is documented and is different from an informal investigation. A court of inquiry is a fact-finding mission and does not pronounce a judgment. It is an administrative procedure, not a court of law. There is no relation between a court of inquiry and a court-martial. The word 'court' is a misnomer in 'court of inquiry'.

At the command headquarters, the officer who examines such proceedings from a lower formation fills a vacancy, "judge advocate general"; he is neither a judge nor an advocate nor a general.

A court of inquiry starts its function on the 'terms of reference' as instructed by the convening authority. After examining witnesses it gives its 'findings' and 'recommendations'. The authority may or may not accept these. If the authority is not satisfied it may reject the whole proceedings of the court of inquiry and ask it to investigate further.

A court of inquiry is unique to the Indian armed forces and there is no comparable civilian body under the Code of Criminal Procedure and the Indian Penal Code. Civilian witnesses are summoned very rarely – normally on occasions when a court of inquiry is constituted to go into accidents involving military vehicles and civilians or civilian property. It cannot compel civilians to appear as witnesses. A journalist summoned before it need not disclose the source of information.

An incomplete court of inquiry is a blot on the administrative facet of any commander. To avoid this possibility, the terms of reference are carefully worded. Not every convening authority gets the correct advice.

The Army Act, the Navy Act and the Air Force Act mention court of inquiry only briefly. Rules made under these Acts too do not deal with them at length. Regulations governing the three arms of the Services, which are enacted by Parliament, amplify some aspects.

A look at the powers of a Summary General Court Martial (SGCM) will be relevant to this discussion. A field commander of a relatively junior rank can convene an SGCM. A convicted individual can be awarded a "death sentence". And there is no provision for mercy petition to the Governor or the President. But an SGCM is convened very rarely.

Silent Valley

Any story on the Silent Valley inevitably brings to one's mind the great war waged through the media for its conservation ("The Silent Valley story", November 5). Let us now hope that the plea for the establishment of a gene sanctuary for the wild strains of pepper found in the valley will be heeded. It is a matter of solace to all who love nature that the valley's animal population has thrived in the years since it was notified as a national park. One also remembers the pivotal role played by *The Hindu* in upholding the cause of the Silent Valley.

Indonesia

The November 5 issue carried an article titled "Towards democracy" regarding political and related developments in Indonesia. The article referred to Australia's policy on East Timor, including its involvement in the multinational force to restore security there, and to the so-called "Howard doctrine" under which the Australian Prime Minister supposedly claimed that Australia would act in a deputy peacekeeping capacity to the United States in the Asia-Pacific region.

It is quite wrong to suggest as some have done that Australia has adopted a policy stance which runs counter to Indonesian policy on East Timor. The decision to request the United Nations to organise a referendum in East Timor to choose between autonomy and separation was not part of Australian policy. It was Indonesian policy, and Australia supported it.

Australia's interests are best served by a strong, prosperous and unified Indonesia, and a constructive relationship between the two countries. Australia deeply values its bilateral relationship with Indonesia. There are undeniably some sensitivities in the relationship at present. Australia believes, however, that common interests will reassert over time, and we will work constructively and persistently to achieve this.

Media reports about the so-called "Howard doctrine" have not accurately represented the expressions used or the position taken by the Australian Prime Minister. What John Howard said was: "You have Australia as a medium-sized, economically strong regional power leading a peacekeeping operation which is largely, but not totally, regional with strong... lender of last resort support from the United States... I don't think it is necessary for America to lead every peacekeeping operation."

Howard added: "We've shouldered the burden that we should carry. And we are a relatively wealthy, economically strong country. We have a particular responsibility to do things 'above and beyond' in this part of the world."

This is what Australia has done with its regional colleagues under the umbrella of the United Nations in the case of East Timor. Australia was asked by the United Nations to take a lead in forming a multinational force to restore security in East Timor. The violence and destruction in East Timor required an urgent response. Australia felt the responsibility, and had the capacity, to take on a central role in providing this, with the express agreement of the Indonesian Government.

Monsanto

This refers to the report "Monsanto's retreat" (Update, November 5).

I must, most regrettably, lodge a very strong protest with you – not on the views expressed in the report, but on the baseless and unsubstantiated allegations made by the president of the Karnataka Rajya Raitha Sangha who has publicly taken a political and ideological stand against the company.

Monsanto has been in India for 50 years and never once has it done anything that would blemish its track record in this country. It has always respected and operated within the laws and regulations in force.

It has been a part of India's efforts to boost agricultural productivity, providing farmers with products and technology that have contributed positively to agricultural production and management. It is unfortunate that a magazine of your standing should have published such unsubstantiated remarks against a company which enjoys the trust and confidence of millions of farmers because they know from experience that it will not do anything that goes against their interests.

The suggestion of sterile seeds being smuggled in is preposterous. In the first place, sterile seeds do not exist. The technology is in the conceptual stage. Nothing more.

Further, Monsanto has publicly pledged that it will not carry the technology forward to commercialisation. It is sad that *Frontline* should have provided a platform for innuendo and unsubstantiated and baseless allegations based on myths rather than reality.

I trust you will print this letter in full and guard against *Frontline* being misused in future by anyone to malign Monsanto with preposterous allegations.

Mumbai

Do you have what it takes to be a Jonathan Livingston?

If you are the one who doesn't believe in the word impossible, who dreams and aspires to be a winner, MBT gives you the flight you've always been looking for.

MBT a joint venture between Mahindra & Mahindra Ltd., and British Telecommunications Plc., U.K. is a leading ISO 9001 certified and SEI-CMM Level 3 Software Consulting and Systems Integration Organisation. We have over 1800 professionals engaged in creating software solutions for prestigious clientele like British Telecommunications Plc., MCI, Singapore Telecommunications, Syntegra, etc. We closed 1998-1999 with exports exceeding Rs. 1750 million. We are also the recipients of the STPI award for the best regional software exporter for last three years and have been rated as one of the top 3 Indian software organisations by The Gartner Group.

At MBT you will work on:

- E-Commerce initiative in the areas of Online Retailing, Online Banking, Digital Certification, Web-based Payment Mechanism, XML-based E-commerce transactions and Web-based EDI
- Intranets/ Extranets, Workflow and Web-enabling legacy applications.
- Products like Message Service Engine, Message Transfer Agents & Universal Mailbox Systems
- Projects in Distributed Systems using latest technologies
- Projects in key Telecom Applications like Network Management & Switch Management
- Three-tier models linking Mainframes, Middle Ware Systems and Front End Systems.
- Data Mining and Data Warehousing technologies to design very large databases.

You need to have expertise in any of the following areas.

Operating System: Windows 98/2000/NT, Windows CE • SOLARIS/LINUX • MVS, OS400

Development Environment: HTML/DHTML, XML, Java Script, VB Script • Java, EJB, Weblogic, C++ • VB, VC++, IIS, ASP, MS SITESERVER (Commerce) • CGI, PERL • VISUALAGE for Java, IBM Websphere, Net.Commerce • OAS, ORACLE Internet Commerce Server, Jdeveloper • Open Market, Broadvision • ENCRYPTION, SET/SSL

Databases: ORACLE 8, SQL Server, SYBASE, Access, INFORMIX, DB2,IDMS

Transaction Processors/Middleware: CORBA, COM/DCOM, MTS, MSMQ, MQ Series, CICS

Telecom Protocols: ATM, SDH, ADSL, ISDN, SS#7 (ISUP, TCAP, INAP), CAS, TCP/IP, X.25, H323, SIP • Wireless Protocols - GSM, CDMA, IS54, DECT, MAP

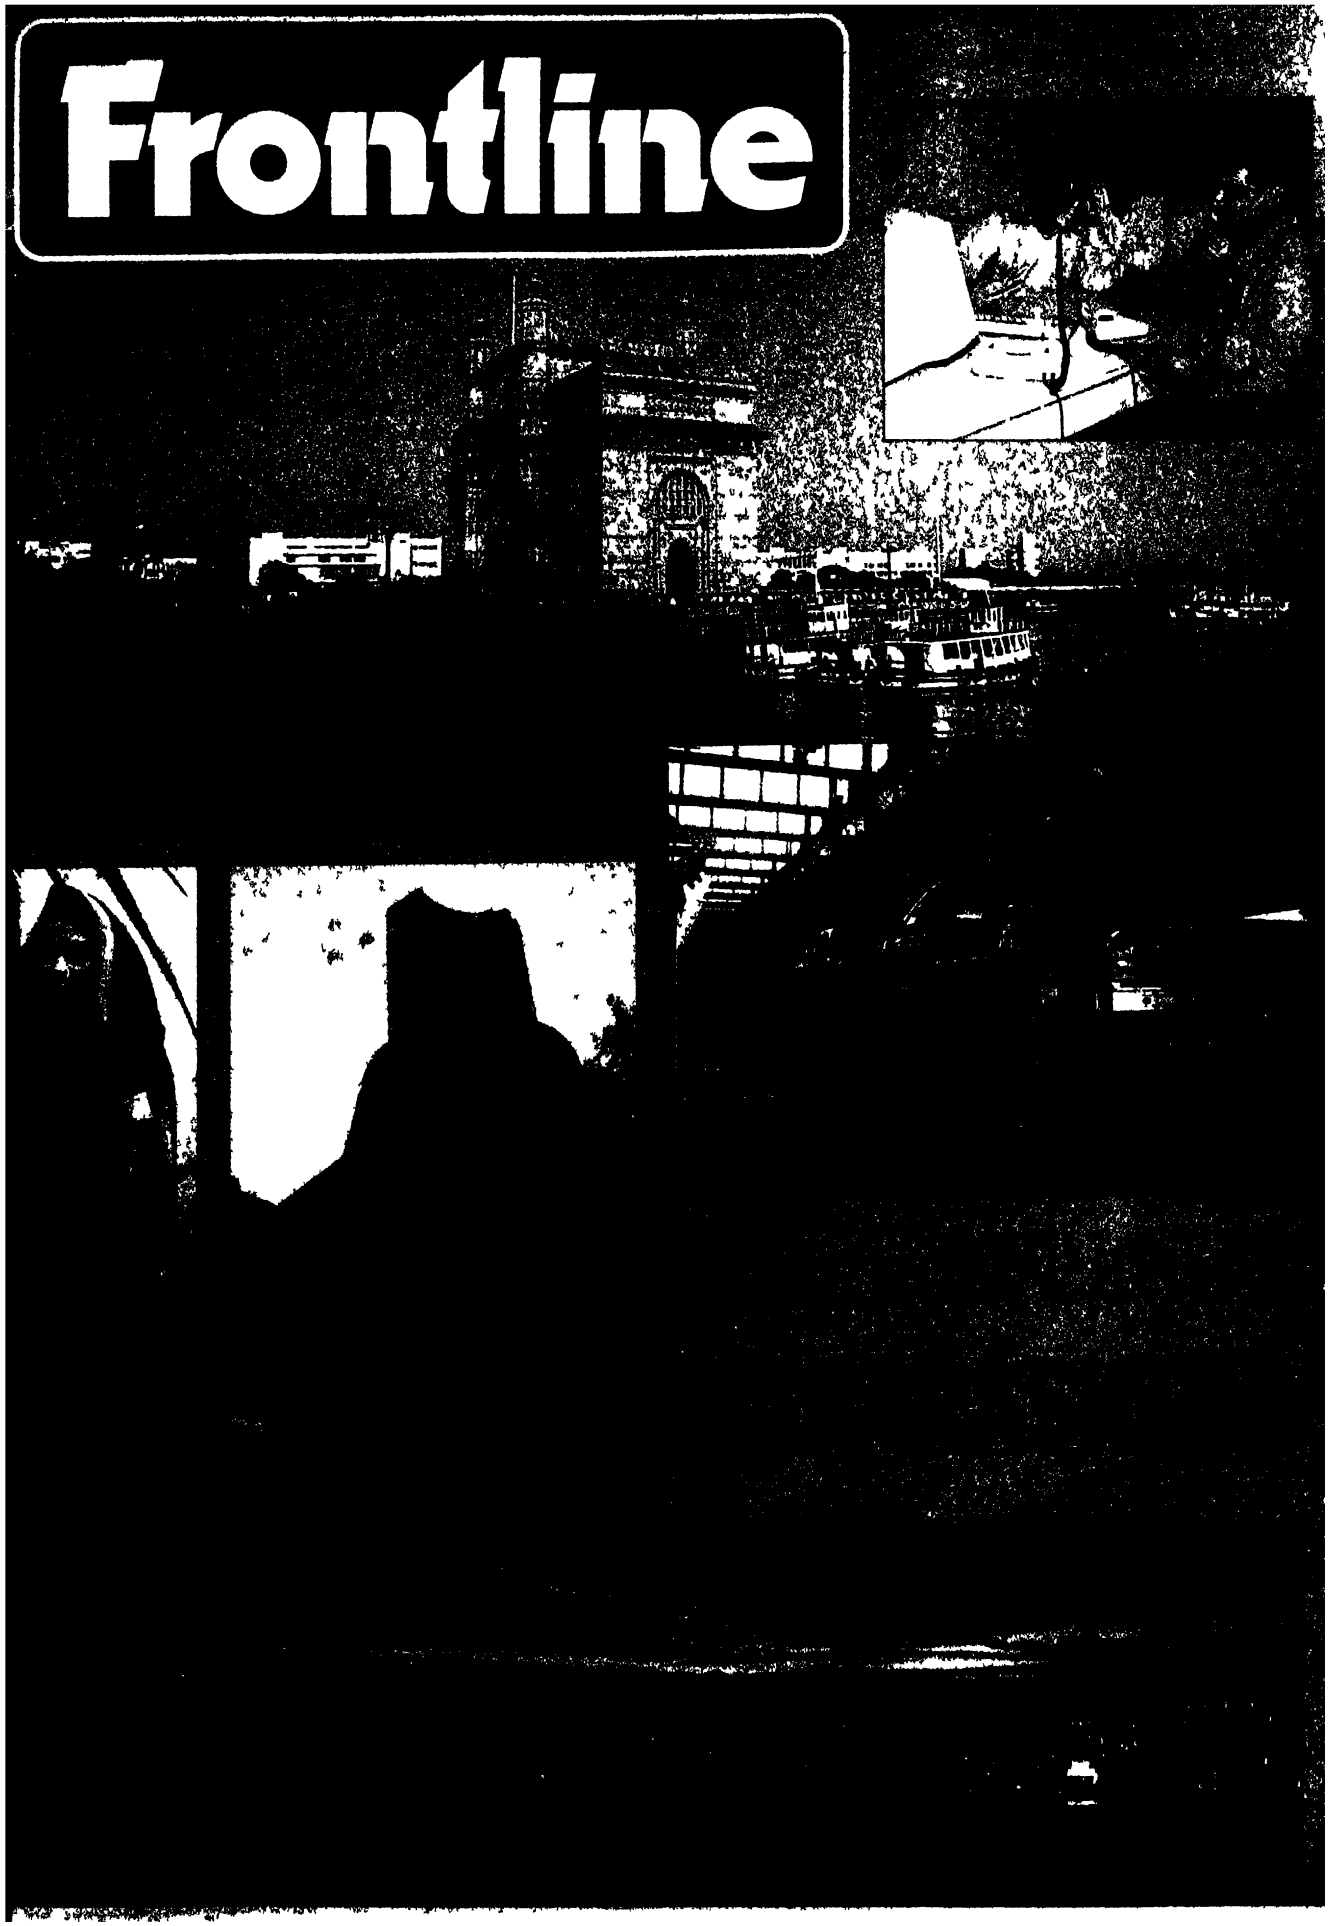
Network Management: SNMP, CMIP, TMN, HP – Open View, TIVOLI, Unicentre TNG, IPC, X-Motif etc.

Embedded Systems: Windows CE, pSOS, VxWorks, QNX

Openings exist in the following positions across all our offices: Pune, Mumbai, USA and UK.

❖ **Project Managers** ❖ **Product Managers**
❖ **Solution Architects** ❖ **Analysts**
❖ **Database Administrators** ❖ **Designers**

You need to have a minimum 4 years' experience in Software Development with a B.E., B.Tech, ME, M.Tech, MCA, or M.Sc.(Comp.Sc).Your communication and presentation skills need to be as brilliant as your ideas.



Our performance linked compensation package which includes housing and sabbaticals is one of the best in the industry and shall not be a constraint for the right candidate.

Email your resume with ***Best Minds*** as your subject, to the address given below. Or courier your resume to The Recruitment Manager within the next 10 days.

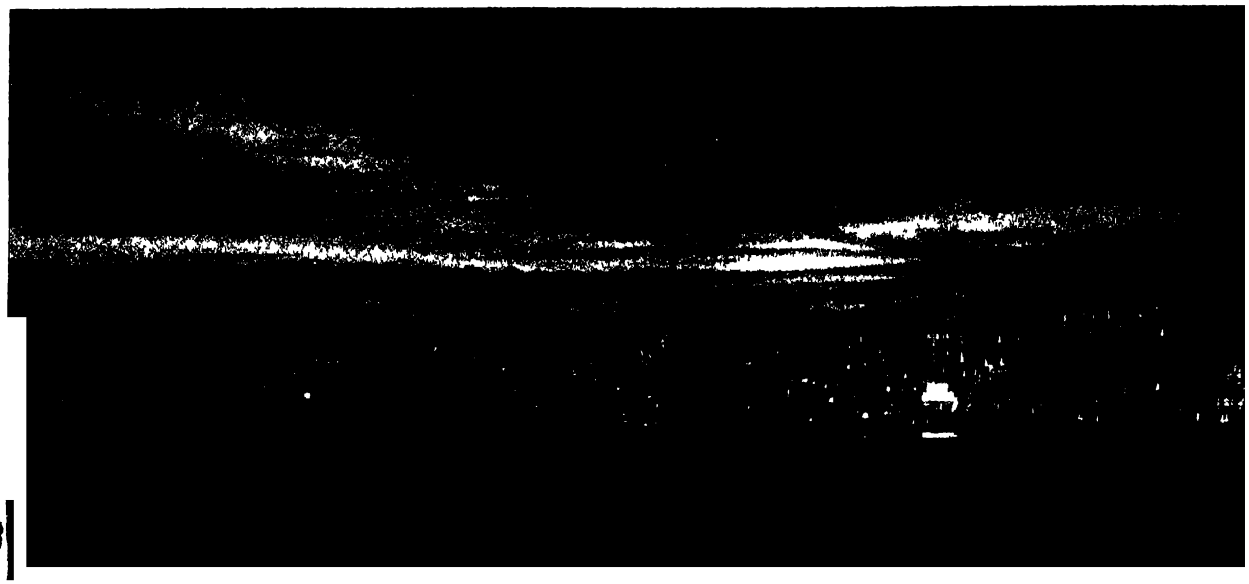
Engines of growth

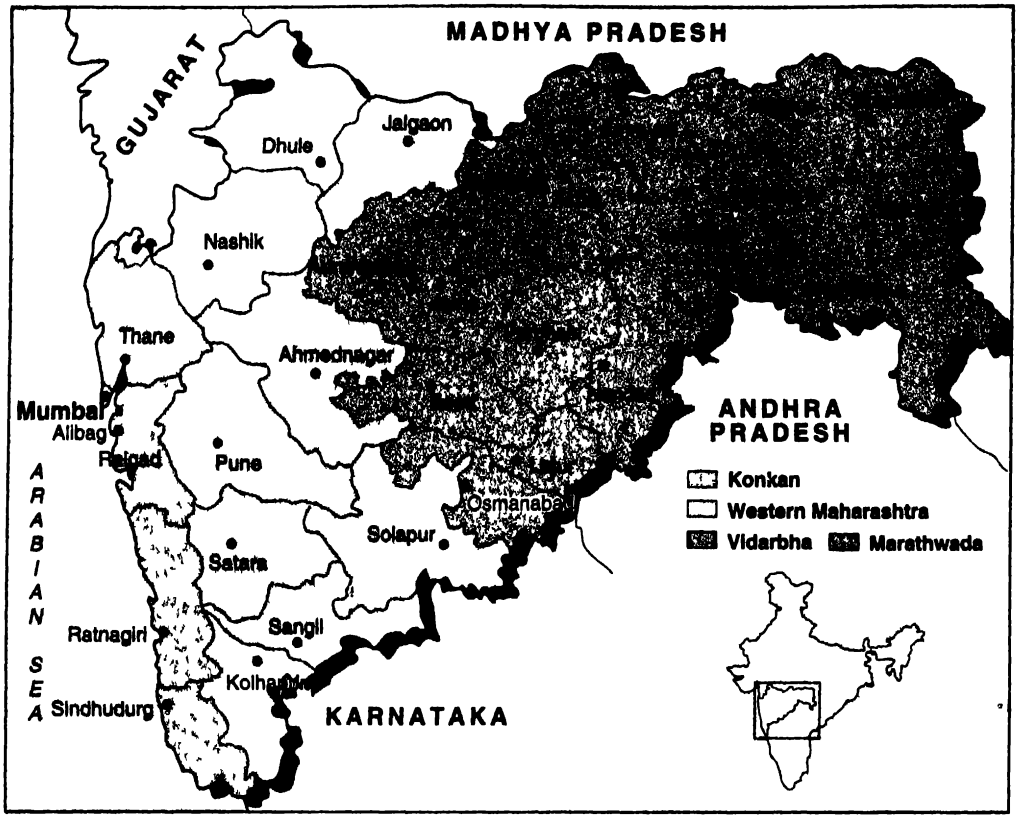
Maharashtra's emergence as India's principal industrial State is organically linked with the fortunes of its capital, Mumbai.

PRAVEEN SWAMI
in Mumbai



A 17TH CENTURY visitor to what is now Mumbai would have seen little more than small fishing villages and farming hamlets spread across an 18-square-mile island. Coconut trees, date palms and palmyra trees grew along the rice fields in the northern and central parts of the island, and interspersed between these were a few salt pans. The roads that now lead to the hinterland did not exist, and what communications there were collapsed during the monsoon. When the East India Company bought the island from the British Crown in 1668, Surat was the main trading base on India's western seaboard.

How did this nondescript island come to be transformed into a city that would contribute to Maharashtra's emergence as India's principal industrial State? And why is Mumbai, more than any other Indian city, linked to the international economy? The answers lie in its colonial past. The Gateway of India on the city's southern tip is not just a monument but a metaphor, for Mumbai was indeed the door through which imperial domination was secured.



Expansion in the 19th century gave Mumbai a colonial hinterland, the fundamental pre-requisite of an important colonial port city. The annexation of Gujarat between 1800 and 1803, and of the Maratha Empire after the third Anglo-Maratha War of 1819, secured British rule in India, with Mumbai at its centre. But, although Mumbai had by then displaced Surat as the principal western port, it was yet to become a great economic centre. According to economists, the reasons for this lie in the fact that economic conditions in China, the main market for Mumbai's products, were in a depressed state until the 1820s.

Calcutta continued to retain its position as India's main industrial city. In 1820, Mumbai's exports were just a quarter of that generated by its eastern counterpart, and imports just half as much in value. But Mumbai was nonetheless growing. By then, artisans and workers from the Deccan and Konkan regions had, along with financiers and merchants from Gujarat, settled down in the city. However, its importance in the imperial scheme of things was still limited: the inhabitants of its European quarter numbered no more than 1 per cent of its population. (Today, the European quarter or the Fort area is at the centre of corporate Mumbai.)

The revival of trade with China in the 1830s gave Mumbai its first real economic opportunity. The demand for opium was growing in the East, and poppy grew in Malwa. For several reasons, traders preferred Mumbai to the Portuguese-controlled ports along the western coast. When the East India Company lost its trade monopoly to China in 1883, further opportunities opened up for Mumbai's traders. (In 1842, Britain brutally took control of the opium trade in China.) Claude Markovits has recorded that the share of opium in the export trade rose from 25 per cent in 1830-1831 to an incredible 42 per cent in 1860-1861. For Mumbai's merchants, the China war opened the doors to unimagined wealth. Claude Markovits has pointed out that before coming to be known as the Manchester of India, Bombay became India's Medellin: Mumbai drug lords, if they can be called that, were responsible

The Mumbai skyline. The city's growth, from a nondescript island in the 17th century to the financial, commercial and corporate capital of the country, has been monumental.

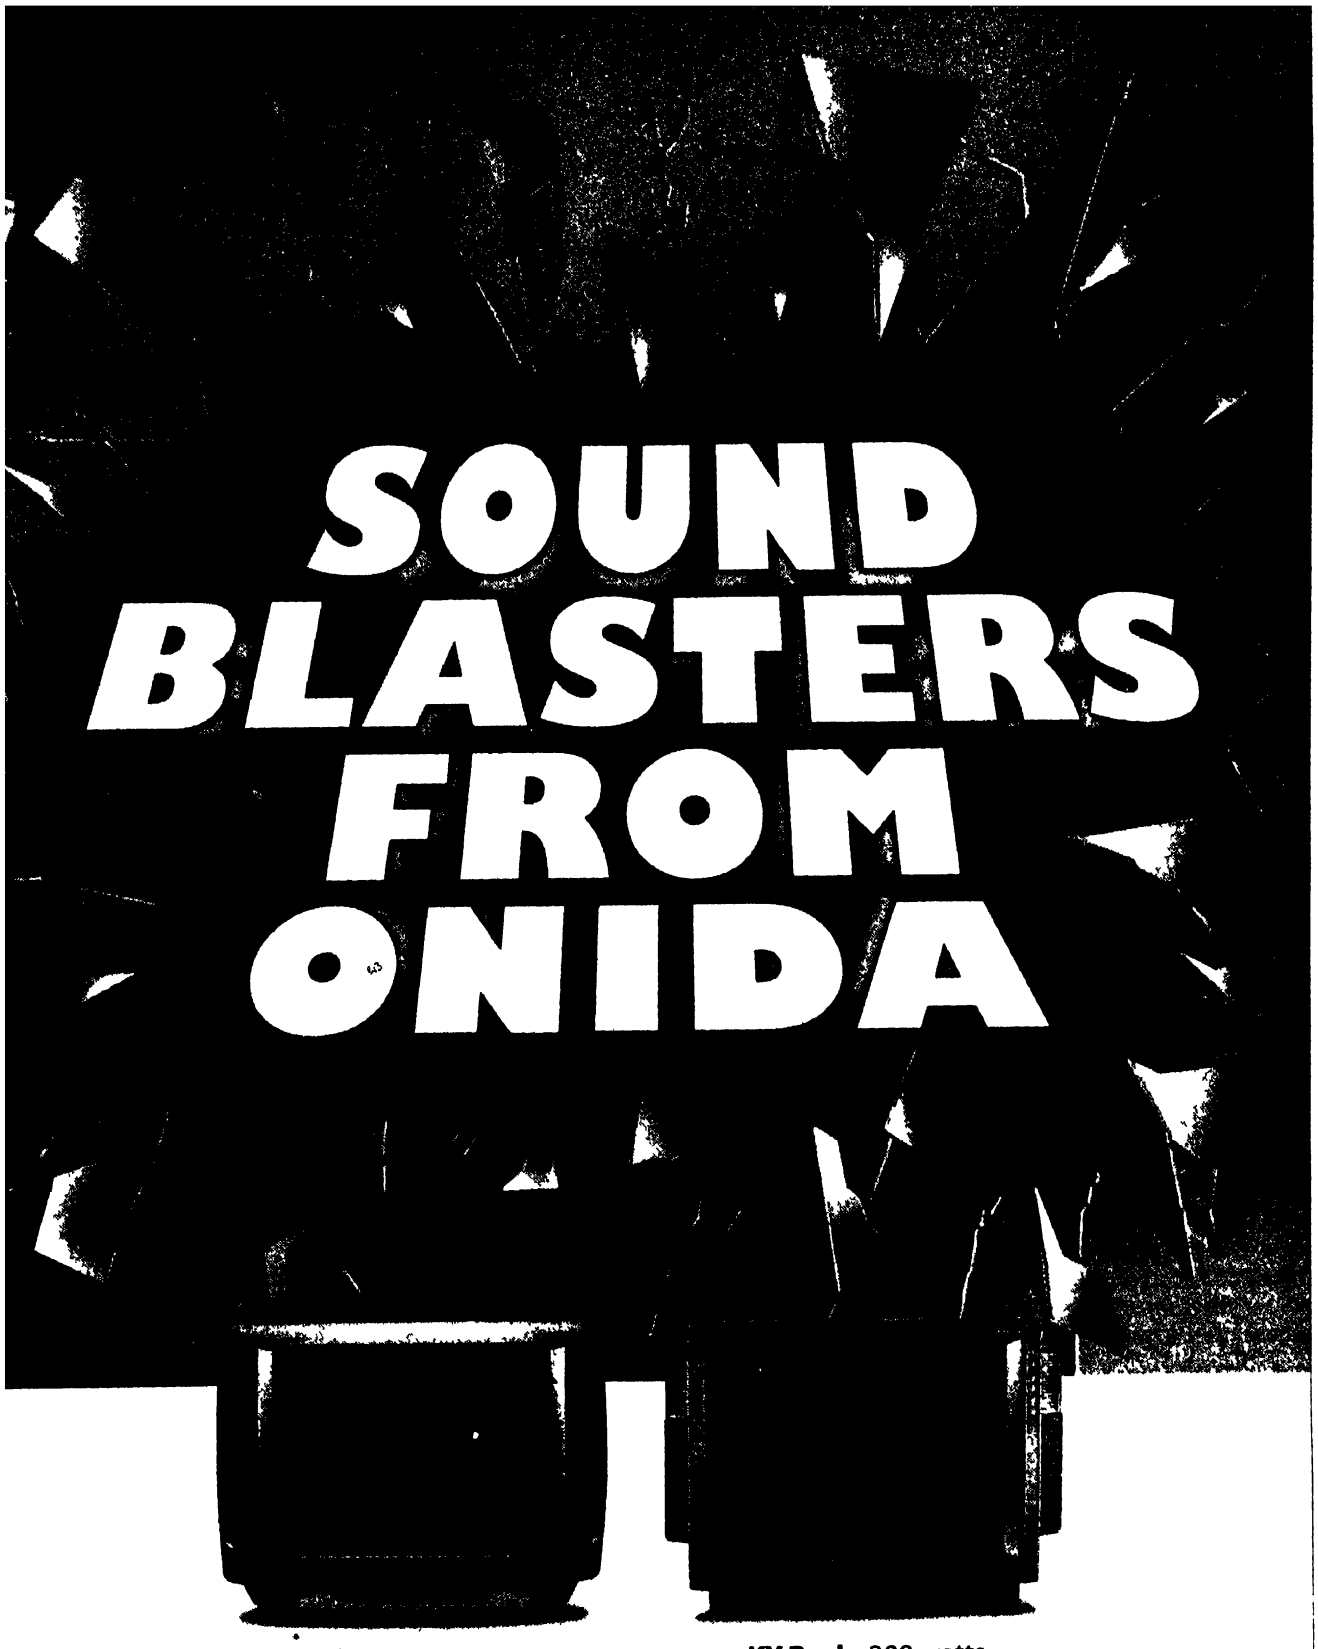
for the city's 19th century boom

However, this was not the only business that was growing. The newly-opened up agricultural hinterland was also providing cotton. Mumbai's opium boom coincided with a sharp increase in the demand for cotton in Lancashire, which, along with Manchester, was at the centre of the Imperial economy. The owners of Lancashire textile mills found American cotton too expensive and began looking East. By 1861, cotton accounted for 44 per cent of the export trade through Mumbai.

None of these would have been possible if it were not for colonialism at work to the west. In the latter half of the 19th century, a regular sea service to England was established through Alexandria, using the newly built Suez Canal. The service was meant to give Mumbai an advantage over Calcutta – the distance to England from Mumbai was shorter than that from Calcutta. The new route helped offset in part Mumbai's disadvantage as a less-developed rural reservoir of labour and companies by providing it with good links to London finance. A booming export trade brought with it the beginnings of a road network. By the end of the 19th century, the cross-country rail network was in place.

If Mumbai failed to displace Calcutta comprehensively in the colonial period, it was at least for two reasons. The first was the collapse of the cotton trade. Calcutta, which had a more diversified pattern of trade, survived the shock better. Secondly, the eastern port city remained the capital of the Empire in India until 1911.

However, Mumbai had other competitive advantages over Calcutta. Mumbai's cotton textile industries were less labour-intensive than Calcutta's jute factories. The pattern of railway development also helped Mumbai, allowing it to encroach on Calcutta's share of trade with the United Provinces and the Hyderabad state.



The onset of the Great Depression in 1926 decisively altered the balance of industrial power in Mumbai's favour. With the decline of overseas markets and the invention of jute substitutes, Calcutta's premier industry began to decline. By contrast, Mumbai's business proved to be far more responsive to increased competition from Japan and China. Playing on the sentiments awakened by the Swadeshi movement, textile industries oriented their production towards Indian consumers. From the 1930s onwards, Mumbai's industrialists rapidly captured positions of dominance in the emerging growth areas of iron, steel and cement.

In some senses, businessmen of the 1930s were building on a long tradition of innovation. India's first modern textile mill – Cowasjee Davar's Oriental Spinning – came up in Mumbai in 1854. While the Tatas introduced the ring spindle in India at their Empress Mills in Nagpur, cement production was first started by the Khataus, and the high-technology automobile and aviation industries were brought to India by Walchand Hirachand. During the same time, India's first large hydro-electric projects came up in the Western Ghats. By 1875, Mumbai had a rudimentary stock exchange. (Calcutta got its stock exchange only in 1908.)

WHY did such an innovative tradition thrive only in Mumbai and not elsewhere in the country? Some economists suggest that the answers lie in the fact that race relations in the city were sharply different from those elsewhere. The Scottish domination of industry in Calcutta, underpinned by the racial arrogance of the Imperial bureaucracy, ensured that there never was a level playing field in that city. By contrast, British business did not succeed in establishing an oligopoly in Mumbai. During the Second World War, the largest business house in Mumbai was Indian, that of the Tatas. Ten of the city's 16 largest business houses were Indian-owned, while one was owned by an Indian, with a British partner. By contrast, in Calcutta, 20 of the 24 largest firms were British-owned, and only one, that of the Birlas, was owned exclusively by an Indian.

After Independence, Mumbai's emergence as India's premier industrial city was assured: Calcutta's struggle to retain its position was shattered not only by the Bengal famine and the Second World War but also by the trauma of Partition.

The emergence of Maharashtra as

India's principal financial centre and its affluence fuelled development throughout the State. Although manufacturing output in Greater Mumbai declined through the 1980s, that in the hinterland shot up. During this period, the share of Thane and Raigad in employment in the manufacturing sector increased dramatically, and peripheral areas such as the Mira Road-Bhayander stretch and Kalyan also grew rapidly.

However, just how Maharashtra in general and Mumbai in particular will shape up in the years to come is unclear. Increased competition from cities such as New Delhi, Bangalore, Hyderabad and Chennai, as well as the dramatic industrial expansion of Gujarat, have hurt Maharashtra.

At the same time, the State's industrialists are finding new areas of opportunity. Pune is set to emerge as a major centre for high-technology enterprises, including computers. Work is in progress to link Mumbai and Pune with an information superhighway, made up of optic fibre cables running alongside a new express highway. Farmers in several traditional sugarcane-growing areas have sought to diversify and expand into grapes and other crops that have high export value.

However, Mumbai has to galvanise itself into action in order to rid itself of the sleaze that has permeated the city. The securities scandal, the communal pogroms of 1992-1993, and the rise of the Shiv Sena-Bharatiya Janata Party alliance to power affected the liberal social ethos that was at the centre of its economic development a century ago. Besides, it immediately needs to deal with a well-entrenched underworld with its interests ranging from the real estate business to the film industry, if it wants to retain investors.

Just how the newly installed Congress(I)-Nationalist Congress Party coalition government tackles Maharashtra's problems remains to be seen. Mumbai's chronic infrastructure problems and the State's alarming level of debt could bog down its economy unless serious action is taken soon. History illustrates the fact that Maharashtra's economy as a whole is, in important senses, driven by developments in Mumbai. If Mumbai's problems worsen, Maharashtra could find itself reliving Mumbai's historic battle with Calcutta. But this time around, the competition will be from new, innovative industrial centres. ■

Leading the field

Maharashtra regains the position of being the State that attracts the largest amount of industrial investment in the country.

PAL NOPOR

The assembly line at the Mercedes-Benz India plant in Pune. Maharashtra is way ahead of other States in the matter of proven capacity to attract foreign direct investment.

R. PADMANABHAN

THE fiscal year 1998-1999 was a memorable one for Maharashtra, a leading industrialised State. That year, it established a record in terms of the volume of private sector industrial investment approved by the Union Government in a State in a single fiscal year. In the process it recaptured the position of being the country's number one haven of industrial investment, a position it had lost to Gujarat between 1994-95 and 1997-98.

According to data from the Secretariat of Industrial Approvals (SIA), published by the National Informatics Centre (NIC), the Centre approved in 1998-99 proposals involving an estimated investment of Rs.42,468 crores in Maharashtra. The proposals, for investment in large- and medium-sized industries, were in the form of industrial entrepreneurs' memoranda or applications for letters of intent (LoI) or leave to set up wholly owned export-oriented units.

The previous record for the highest volume of industrial investment approved by the Centre in a State in one fiscal year was held by Gujarat, which, in 1994-95, secured approval for proposals involving an investment of Rs.33,639 crores. By the end of that year, Gujarat had overtaken Maharashtra in the cumulative volume of industrial investment approved by the Centre since August 1991 (when the era of liberalisation of the Indian economy may be deemed to have begun), establishing a lead of Rs.2,799 crores over the latter. This lead increased to Rs.19,269 crores by the end of 1997-98. However, Maharashtra staged a comeback in no uncertain manner: by the end of 1998-99 it had established a lead of Rs.14,883 crores over Gujarat.

Between August 1991 and June 1999, the Centre approved 8,199 proposals for industrial investment in Maharashtra, involving a total estimated investment of Rs.1,72,558 crores – Rs.18,890 crores ahead of the figure for Gujarat – and

RADEUS/LHF/1740/98

promising direct employment for 14,69,086 persons, about 8.5 persons per Rs.1 crore of investment.

However, Maharashtra cannot afford to take its dominant position for granted. Of late, besides Gujarat, Tamil Nadu, Orissa, Karnataka and Andhra Pradesh have also been successful in attracting sizable industrial investment.

Source CMIE's Survey of Investment Projects, August 1999

TO what extent do the investment proposals approved by the Centre culminate in projects on the ground? Maharashtra's Directorate of Industries has monitored the progress of 6,332 of the 8,199 proposals that have been approved for the State since August 1991, involving a total estimated investment of Rs.1,72,558 crores. It has found that 3,357 of the proposals have been implemented at a total cost of Rs.51,926 crores. The projects concerned have gone into production, providing employment to 2,95,254 persons. Another 1,022 proposals, involving investment totalling around Rs.23,361 crores and promising employment to an estimated 1,17,481 persons, are in the process of being implemented. While some of the remaining 1,953 proposals on the monitoring list are progressing towards implementation, a substantial number of them have been dropped, deferred or shelved or are being reconsidered by the entrepreneurs concerned.

Like the data published by the NIC, the August 1999 Survey of Investment Projects (SIP) of the Centre for Monitoring Indian Economy (CMIE), Mumbai, provides telling evidence of Maharashtra's return to the top position among the industrialised States. The CMIE surveys at three-month intervals the outstanding investment (investment in projects announced, proposed or under implementation) in large and medium projects in the areas of manufacturing, mining, power generation and distribution, services and irrigation. (Public sector investment is also included.) All the six surveys the CMIE conducted between May 1998 and August 1999 found that Maharashtra was ahead of all the other States in outstanding investment.

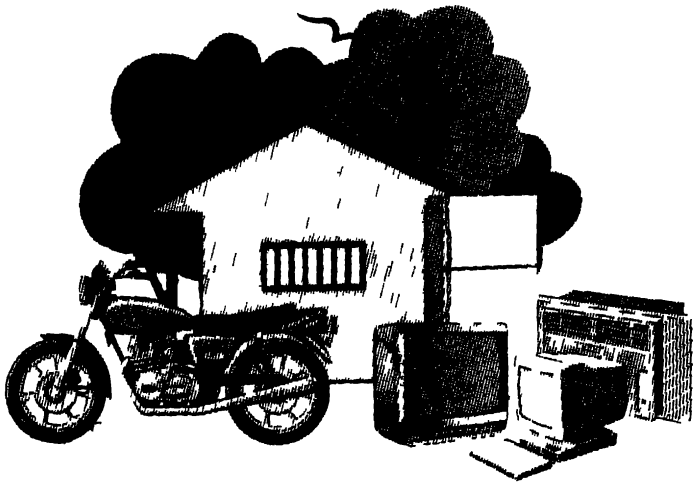
According to the latest survey, the outstanding investment in Maharashtra as of July 1998 stood at an estimated Rs.1,51,739 crores. It is followed by Tamil Nadu, with outstanding investments totalling an estimated Rs.1,41,472 crores, and Gujarat with Rs.1,36,449 crores. Investment in Maharashtra is spread across 618 projects. The corresponding figures for Tamil Nadu and Gujarat are 272 and 274 respectively. But it is Karnataka, with a figure of 299, which is second to Maharashtra in the number of outstanding projects.

According to the CMIE's *Monthly Review of Investment Projects* (January 1999), the major factors that contributed to Maharashtra regaining its top position include the announcement of a couple of large infrastructure projects (one of them being a Rs.5,000-crore cargo complex for Nagpur) and a couple of roadways projects estimated to cost about Rs.5,000 crores; the revival of a Rs.4,500-crore petrochemical project by NOCIL; a proposal by the Nuclear Power Corporation of India to set up a project in the State (substantial expansion of the Tarapur Atomic Power Station, or TAPS, in Thane district at an estimated cost of Rs.6,421 crores); and an escalation in the estimated costs of some of the steel projects in the pipeline.

Out of Maharashtra's outstanding investments totalling Rs.1,51,739 crores as of July 1999, Rs.88,800 crores are in projects under implementation. Thus, the rate of implementation is 58.5 per cent. In this area too, Maharashtra is ahead of other States. Andhra Pradesh is a poor second, with a rate of implementation of 48.4 per cent, and Tamil Nadu is in the third place, with just 27 per cent.

The CMIE review says that the rise in project investment in Maharashtra "could probably mark a reversal of the trend" of investments in the State slowing down during 1994-97 after rising sharply during the earliest years of liberalisation. "This period had also seen many projects being shifted to the neighbouring States," according to the review.

"Inadequate infrastructural facilities in the interior part of the State (Maharashtra), local resistance against new projects in the coastal areas, as also increased competition amongst States, had led to a drop of fresh investment proposals in the State. In an attempt to attract more investments, the State government announced additional tax concessions to large projects," it says.



Given this background, it is noteworthy that as much as 25.5 per cent of the outstanding investment in large and medium projects in the State as of July 1999 was in the electricity sector and that another 32.3 per cent was in the services sector, including physical and social infrastructure. Manufacturing accounts for only 21.9 per cent of the investments; mining and irrigation account for 1.3 per cent and 19 per cent respectively. Power generation, transport services, chemical industries, storage and distribution services and metal and metal product industries account for 25.4 per cent, 16.6 per cent, 7.8 per cent, 7.8 per cent and 7.1 per cent respectively.

The large power projects being implemented in the State include, besides the TAPS project, the Rs.7,450-crore second phase of the Enron-promoted Dabhol project in Ratnagiri district; the Ispat group's Bhadravati thermal power project in Chandrapur district (Rs.4,636 crores); Jindal Power Ltd's Raigad power project (Rs.2,412 crores); the Reliance group's Patalganga project in Raigad district (Rs.2,000 crores); and Ispat Energy Ltd's Dolvi power project in Raigad district (Rs.1,500 crores). They also include projects relating to the expansion of the Koyna hydroelectric project in Satara district (Rs.2,500 crores), and the Maharashtra State Electricity Board's Khaparkheda (thermal) project in Nagpur district (Rs.1,353 crores).

The large manufacturing projects that are being implemented in Maharashtra include Ispat Industries' hot-rolled steel project (Rs.4,845 crores), Ispat Metallics India's hot metals project (Rs.1,840 crores), and HOC Chematur's MDI (methyl di-isocyanade) project (Rs.366.73 crores), all in Raigad district; Usha Ispat's hot-rolled steel coils project (Rs.1,990 crores) in Sindhudurg district; TELCO's small car project (Rs.1,700 crores), which saw the launching in January 1999 of the Indica, the company's first passenger car, in Pune; and a part of Ashok Leyland's multi-State commer-

cial vehicle project in Bhandara district (Rs.1,700 crores).

As these figures indicate, the Ispat group is deeply involved in the industrialisation effort that is under way in Maharashtra.

Raigad district has the largest share (16.7 per cent) of the outstanding investment. It is followed by the districts of Thane (11.1 per cent), Greater Mumbai (10 per cent) and Ratnagiri (7.2 per cent). Since all these districts are in the Konkan, it goes without saying that this coastal region has bagged the lion's share of the investment. Other districts that have a substantial share of the outstanding investment are Pune (6.4 per cent) in western Maharashtra and Nagpur (4.5 per cent) and Chandrapur (3.7 per cent) in Vidarbha. Each of these districts has outstanding investments in excess of Rs.5,500 crores. Northern Maharashtra or Marathwada, the State's most backward region, does not figure in the list of districts having investments of such magnitude.

An analysis of the distribution of outstanding investments by ownership as of July 1999 reveals that the State government has a much larger share of the total investment in Maharashtra than in any of the five other States that have attracted substantial investments. In Maharashtra, 136 State government projects involving investments totalling Rs.58,483 crores account for 38.5 per cent of the total investments in the State. The State that comes closest to Maharashtra in this respect is Andhra Pradesh, where State government investments account for 26.6 per cent of the total investments. Given the financial crunch that the Maharashtra government has been facing, there is scope for an investigation into the question of whether the government was justified in going in for investments on such a large scale.

The Indian private sector accounts for 23.6 per cent of the outstanding investments in the State, while the foreign private sector accounts for 21.1 per cent. This shows that Maharashtra is way ahead of other States in the matter of proven capacity to attract foreign direct investment (FDI). According to SIA data published by the NIC, the Centre has approved a much larger volume of investment for Maharashtra than for any other State every year since 1992-93. A record total FDI of Rs.6,458.78 crores was approved for the State in 1997-98. Between August 1991 and July 1999, Maharashtra bagged 1,428 approved FDI proposals, representing an estimated investment of Rs.24,588.14 crores. Tamil Nadu won the second largest number (925) of such proposals approved during this period, and Karnataka the second largest estimated volume of investment – Rs.14,864 crores.

According to the SIP (August 1999), 75 major projects involving investments totalling Rs.7,464 crores were completed in Maharashtra between August 1998 and July 1999. Eleven such projects, undertaken by foreign private enterprises, accounted for 62.4 per cent of the total investment, and 43 projects undertaken by Indian private enterprise for 23.3 per cent. The State government's share of the investment in the completed projects is 4.3 per cent and the Centre's share 10 per cent.

An analysis of the sectoral pattern of investments in the completed projects reveals that power generation accounted for 43.3 per cent of the total amount

invested, manufacturing 39.3 per cent, mining 2.2 per cent and services the remaining 15.2 per cent.

The largest project completed in Maharashtra between August 1998 and July 1999 is the Rs.3,128-crore first phase of the Dabhol power project. Two automobile projects – the Rs.750-crore passenger car project of Mercedes Benz India Limited and the Rs 200-crore two-wheeler and three-wheeler project (substantial expansion) of Bajaj Auto, both located in Pune, together account for as much as 12.7 per cent of the total investment in the completed projects.

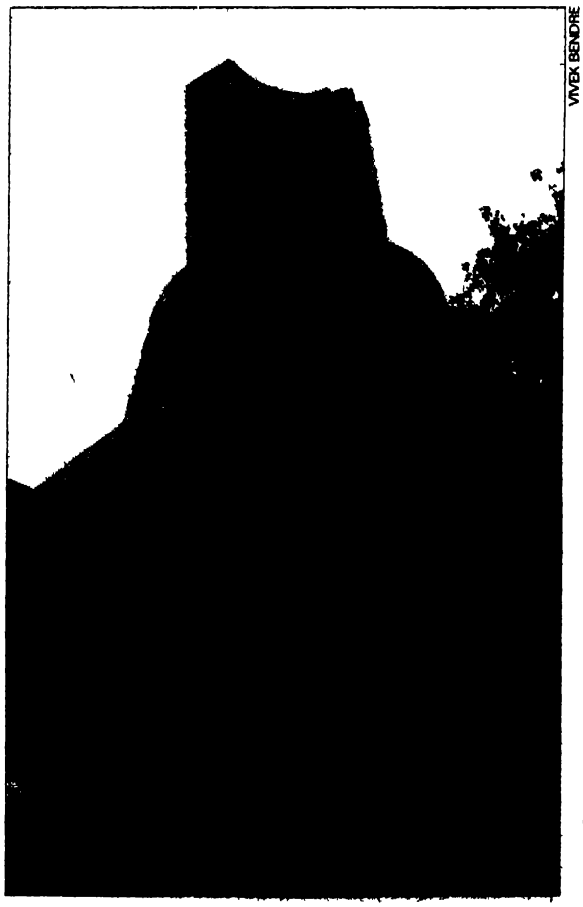
Also completed between August 1998 and July 1999 were the Rs.400-crore glass fibre project of Owens-Corning (India) Limited (yet another manifestation of FDI), a Rs.250-crore nitrogenous fertilizer project of Rashtriya Chemicals and Fertilisers, a Rs. 177.38-crore ethylene project of Indian Petrochemicals Corporation Limited (IPCL) and a Rs.15-crore Portland slag cement project of Indo Rama Cements, all located in Raigad district. The list of completed projects also includes Western Coalfields Ltd's Ukni OC coal project (Rs.100.37 crores) in Chandrapur district.

A WORD or two about certain policy initiatives of the Maharashtra government would be in order. On January 14, 1999 the government approved sales tax incentives for mega projects in the automobile sector located in the Mumbai Metropolitan Region or the Pune Metropolitan Region. By definition, mega projects are projects that envisage an investment of more than Rs.1,500 crores in gross fixed capital. The sales tax incentives would be available for two years, subject to a ceiling of 10 per cent of the gross fixed investment in a given project. This policy initiative was evidently prompted by the slipping away of several passenger car projects from Maharashtra's grasp.

Another thrust area for the State government is information technology (IT). The government has adopted a policy aimed at making the State globally competitive in the IT sector. Among the strategies to be adopted to achieve the goal are measures to "make the people of the State computer-literate and produce top-class IT professionals through strong human resource development initiatives" and to provide the IT industry and IT-facilitated services with a fillip through fiscal and non-fiscal incentives. ■

Growth unlimited

With some streamlining of its physical and administrative features, Mumbai can aspire to achieve a more globally prominent position.



KRIPA RAMAN
in Mumbai

MUMBAI, the financial, commercial and corporate capital of the country, has all the features required of a world-class financial centre. The country's apex bank, the Reserve Bank of India, and the Export Import Bank of India (Exim Bank) have their headquarters in Mumbai. The State Bank of India, the country's largest bank, also has its head office here. Besides, a number of other public sector commercial banks and private banks have their main operations in Mumbai, with the city contributing between 45 per cent and 50 per cent of the deposits mobilised and nearly 70 per cent of the advances made.

Financial institutions such as the Industrial Development Bank of India (IDBI) and the ICICI also have their headquarters in Mumbai; the Infrastructure Development Finance Corporation has its operating office in the city. Naturally, Mumbai gets the bulk of sanctions and disbursals by financial institutions (FIs) – nearly 75 per cent of the total.

Even a largely State government institution such as SICOM Ltd offers foreign exchange loans to industry. (SICOM is the first State industrial development corporation to offer foreign exchange loans.)

Then there is the Bombay Stock Exchange (BSE), established in 1875 as The Native Share and Stockbrokers' Association. It is the oldest stock exchange in Asia (the Tokyo Stock Exchange was founded in 1878). The BSE accounts for close to 90 per cent of the market capitalisation in the country and about 70 per cent of the listed capital.

VIVEK BENDRE

The Bombay Stock Exchange. It accounts for close to 90 per cent of the market capitalisation in India.

Nearly 15 foreign institutional investors (FIIs) have their broking operations in Mumbai. More than 400 FIIs route their investments through Mumbai-based brokerage firms. Some of them, such as Dresdner Kleinworth Benson, S.G. Asia and Jardine Fleming, have their Indian arm in Mumbai.

Mumbai is also home to the largest mutual fund (MF) in the country, the Unit Trust of India, often referred to as the "Big Daddy" of the Indian securities markets.

General Insurance Corporation, the holding company of the four State-owned insurance companies, also operates out of Mumbai. Life Insurance

Are your investments in keeping with your age?

Part II

By a panel of experts

Last time we described life-cycle financial planning and discussed Phases I and II. We now move on to the other two.

Phase III : Age Group 45 to 60 years

Objective: Retirement Planning

If you are a salaried individual, you have to only augment your corporate benefits like Provident Fund, Gratuity, Superannuation, Pension, etc. If you are self-employed or a professional you must make full provision for a secure retirement.

You can look at PPF, Infrastructure Bonds and share dividends for fully tax exempt income under Sec 10. Consider N.S.C., Units, Mutual Funds, etc. for tax-free incomes under Sec.80-L.

Objectiv:Home Ownership Provision

Loans from employer, P.F. and financial institutions. Secure the prepayment of loan (against your untimely demise) with a mortgage redemption policy.

Objective: Preparing your Family for Life without You

Tell your family about your investments and planning and acquaint them with your financial arrangements as well as your financial and legal advisors.

Objective: Opportunity Fund

Set up a fund in bank fixed deposits/bonds to take advantage of opportunities of starting a business or making a good investment.

Phase IV : Age Group above 60 years

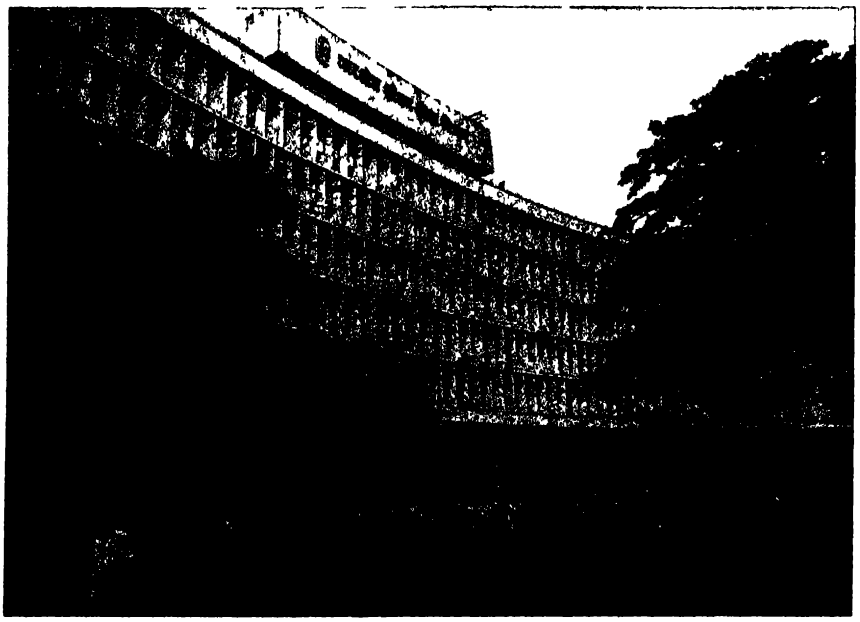
Objective: Regular Income from Investments

If you want money at frequent intervals, the Monthly Income Schemes of UTI are best suited. If you prefer a less frequent inflow, say once every three months, there are other avenues such as bonds that will meet your need. Also, shuffle your portfolio of investments in shares.

Objective: Post Demise Provisions

Set up a fund to defray the costs of disposal of the estate and to settle taxes that might remain unpaid at the time of your demise.

This is the phase when a powerful new concern emerges, overriding financial objectives: the occupation of your time. A neat solution is to work as a consultant (rather than do a part/full-time job). The advantage is that, while it takes care of your time, you can reduce your tax liability by claiming part of your house rent, electricity and telephone charges, car expenses, depreciation on car and office equipment, all as business expenses. Besides, you work at your own pace and place.



Your Mediclaim policy allows you annual health check-ups at designated centres. This will enable you to address another concern typical of this phase: your health.

The four phases are not really watertight compartments. The objectives and strategies can overlap across phases and vary from person to person. You must therefore fix your position in your life-cycle, identify those objectives that you want to make your own, select matching strategies, study and analyse the various saving/investment options available, and then decide your plan of action.

Your Net worth (the difference between what you own and what you owe) is a good indicator of your financial planing. You must calculate it and review it every year.

Planning is useful only when it is followed by action. So ACT TODAY!

O&M Financial/Frontline

VIVEK BENDRE

Life Insurance Corporation of India's headquarters in Mumbai. The city has all the features required of a world-class financial centre.

Corporation of India is also based in Mumbai.

Indications are that Mumbai will evolve into a purely financial and services centre.

However, the housing and commuting problems of the city have led many corporate houses to seek roomier pastures such as New Delhi and Chennai. Manufacturing is clearly headed out. Several of the smaller industries in the Thane-Belapur belt in the Mumbai Metropolitan Region (parts of Thane district and Navi Mumbai form part of the Mumbai Metropolitan Region) have shut down or moved out.

The corporate and financial world saw the writing on the wall some time ago when a group of people from that section got together to form Bombay First (Mumbai was formerly known as Bombay). At a 1994 seminar organised by the Bombay Chamber of Commerce and Industry and the British Council Division, this group discussed the city's future as an emerging global financial centre. The concept of Bombay First was similar to that of London First. (London repackaged and marketed itself as a major financial and commercial centre when employers and labour began to desert the city.) Members of Bombay First felt that Mumbai should do likewise. They felt that since Mumbai has an enviable geographical location, situated as it is between the large cities of South-East Asia and the commercial and financial hubs of Europe – London, Zurich and Frankfurt – it could be a hub between the two regions. Mumbai's large English-speaking skilled workforce would be an added asset.

The Confederation of Indian Industry (Western Chapter) went a step further and requested permission from the RBI to develop the city as an Offshore Financial Centre (OFC). One of the main supporters of this proposal is Nimesh Kampani of JM Financial, who believes that the metropolis could become one of the top OFCs in the world if it is declared a free port and a tax-free zone. Since this requires a host of approvals, the proposal is still in the realm of imagination.

MUMBAI could, meanwhile, improve upon its status as the financial capital of the country and try to achieve a more prominent position globally. At a CII conference on the services sector held in Maharashtra a year ago, Tino Puri of McKinsey & Co. remarked that Mumbai could become a world-class financial centre with some streamlining – for example, reducing stamp duty, ensuring better connectivity and so on.

Mumbai also has the largest air and maritime commercial hubs in the country, besides the largest bullion and forex markets. It will have the most modern diamond bourse in the world if plans for the Bharat Diamond Bourse at the Bandra-Kurla complex take off.

Observers feel that contrary to indications, Mumbai has enough space to accommodate any amount of growth in the financial and commercial sectors. One view, a view which is often contested by pro-working class groups, is that freeing mill lands for development could release considerable space for both office and residential purposes in central Mumbai. Many of the old textile mills in central Mumbai are slowly becoming home to advertising agencies, consultancies, entertainment firms and the like. The India property markets report for 1998-99 of the real estate services company Jones Lang Lasalle noted that in the prime industrial belt of Andheri a number of industrial units were being used for commercial purposes.

The problem of space was solved to a certain extent when the previous Shiv Sena-Bharatiya Janata Party government lifted the 1970s ban on the development of further office space in the city. The floor space index (FSI) has now been increased for several categories of buildings and areas.

The Rent Control Act, however, remains a big problem, especially in South Mumbai, making a lot of space unavailable for use or improvement. However, since South Mumbai is no longer the sole preserve of companies – many of them are looking to the northern suburbs – it is not an insurmountable problem.

The Shiv Sena-BJP government had also planned major entertainment and shopping centres in the city for its working population. It had allocated space under flyovers – 55 of which were to be built in the metropolitan area, involving a cost of roughly Rs.1,500 crores – and built-up space above railway stations for this purpose. (Twenty-five of these flyovers have either been completed or are in various stages of construction.)

The State government also came up with a special Information Technology Policy last year which allowed for residential space to be used as office space for operations relating to information technology. At Navi Mumbai, the Maharashtra Industrial Development Corporation is developing a Millennium Industrial Park, while SICOM is developing the Vashi Infotech Park. (The Vashi Infotech Park claims to offer all facilities IT companies require at a single location.)

Although other Indian cities are competing with Mumbai to attract capital – whether manufacturing or financial – the

When you have over 1,00,000 new customers in a single day, there's only one way to treat them.

As Individuals.

At ABN AMRO, we've always believed in giving our customers personalised attention.

The fact that over 1,00,000 new customers have joined us recently makes us only keener to meet their individual requirements.

That probably explains why we are one of the largest banks in the world today with an asset base of US $504 billion and a global network of over 2000 branches in 76 countries and territories.

WHAT YOU CAN LOOK FORWARD TO

To begin with, you can avail of attractive car loans customised to your particular needs.

Additionally, you can bank with us every day of the year, thanks to our 365-day* banking. (No Sundays, no holidays for us, no headaches for you!)

Then, you have the facility of Express Cash delivery at your home within 2 hours (for a nominal fee).

Our Doorstep Banking facility, on the other hand, will help you bank from the comforts of your living room (Just give us a call and we'll visit you, be it to open an account, pick up your cheques or to deliver your DDs and Pay Orders.)

What's more, we offer Extended Banking Hours and Phone Banking in all our centres.

We shall soon be introducing new value-added products like Loan against Demat Shares, Personal Loans, Mortgages and the Debit Card to help you stretch your money that much further. (Not to mention, more branches and over 20 new ATM sites across the country.)

So step into any of our branches today. We promise you, we'll help you fulfill your individual banking needs.

*Calcutta excepted.

To access Bank by Phone services, dial: New Delhi: 372 2333, Mumbai: 285 4001, Chennai: 821 5151, Calcutta: 210 7070.

State government feels that several factors favour Mumbai, including the availability of ample electricity. Many offices that relocate to cities such as Delhi and Bangalore have had to make alternative arrangements for uninterrupted power supply.

The Shiv Sena-BJP government had also sanctioned the development of five-star industrial estates in the State in Nagpur, Nashik, Sinnar, Amravati, Aurangabad, Kolhapur, Mahad-Ratnagiri, Pune and Nanded. Industries located there would naturally have a liaison office or financial operations office in Mumbai or in the Mumbai metropolitan area.

One view is that Mumbai needs to streamline itself physically since it presents a picture of decay. More than half of its population lives in slums. Although several rehabilitation schemes have been proffered, none of them has been able to solve the problem. It is hoped that the dispersal of the manufacturing industry will lead to a dispersal of some of its population. The Municipal Corporation of Mumbai has come up with a grand plan to clean up and refurbish the city at a cost of more than Rs 3,000 crores, loans for which are proposed to be raised from the Housing and Urban Development Corporation (HUDCO) and FIs. It remains to be seen what plans the Congress(I)-Nationalist Congress Party government has for the development of the State, its capital in particular.

The World Bank-funded Mumbai Urban Transport Plan Phase II will hopefully help speed up commuting within the city. A separate Mumbai Rail Vikas Corporation has been set up in order to streamline the rail system.

In addition to all this are the immeasurables. Many people in the industry feel that Mumbai allows the young executive a good working atmosphere as well as a modern lifestyle. As a young professional working in the city said: "The city never sleeps and young people will not get bored in the hours after work. It is a safe place for women executives who may have to work late. This is also the place where your work speaks for itself."

There is much debate as to whether Maharashtra, and with it Mumbai, is losing its premier status as a business region. Maharashtra, however, claims that it is still number one, and that by revamping itself and repositioning its capital city as a financial and services industry hub, it will continue to remain so ■

Towards better connectivity

Maharashtra gears up to use information technology in building bridges between the government and the people.

SUREKHA SULE

BOLSTERED by its leading position in industrial development, Maharashtra is set to take a big leap forward in information technology. The State is keen to ensure 'anytime, anyhow, anywhere' connectivity to empower people at the grassroots. It hopes to achieve this by replicating extensively the Warananagar Wired Villages project.

On August 15, 1998, the Shiv Sena-Bharatiya Janata Party government launched the State's IT policy and announced 1999 as IT year. It also decided to develop the Mumbai-Pune corridor, where the IT industry is concentrated, as a 'Knowledge Corridor'. The Santacruz Electronics Export Processing Zone (SEEPZ) in Mumbai was started in 1972. It houses several leading IT companies.

India is expected to emerge as a major IT power in the Asia-Pacific region. A survey found that Australia, South Korea, Taiwan and India dominated the two largest segments of the IT industry, namely personal computers (PCs) and services, and by 2003 Australia, China and India together would drive the demand for services across the region. According to a five-year forecast, the IT industry in India, which has a compounded annual growth rate (CAGR) of 28 per cent, would overtake those of Korea and Taiwan. Along with China and Indonesia, India has the highest five-year CAGR in the region. Even as the region reeled under its worst recession, India stood firm and increased its shipment of PCs by 30 per cent. In the PC segment, India is expected to remain the fastest growing market.

According to *Dataquest*, India sold 1.7 lakh PCs in 1996, when the turnover of the IT industry was Rs 6,000 crores. In spite of the subsequent economic slowdown, the industry's turnover increased to Rs 24,000 crores and the sale of PCs touched the million mark. The pace of IT absorption has been breathtaking across

Hiranandani Gardens in the Mumbai suburb Powai. In an effort to provide incentives to IT entrepreneurs, the State government has introduced numerous measures, including permitting the software industry to function in residential areas.

ll industries; this has been true of both systems and applications.

Maharashtra contributed a lion's share to the IT boom, largely through initiatives in the private sector. As Karnataka and Andhra Pradesh became more IT-savvy and Bangalore and Hyderabad became the preferred destinations for domestic as well as international IT players, Maharashtra appeared to be losing the race. But recent measures by the State government, such as providing incentives to IT entrepreneurs, are bound to attract new investments.

Maharashtra contributed a lion's share to the IT boom, largely through initiatives in the private sector... Recent measures by the State government are bound to attract new investments.

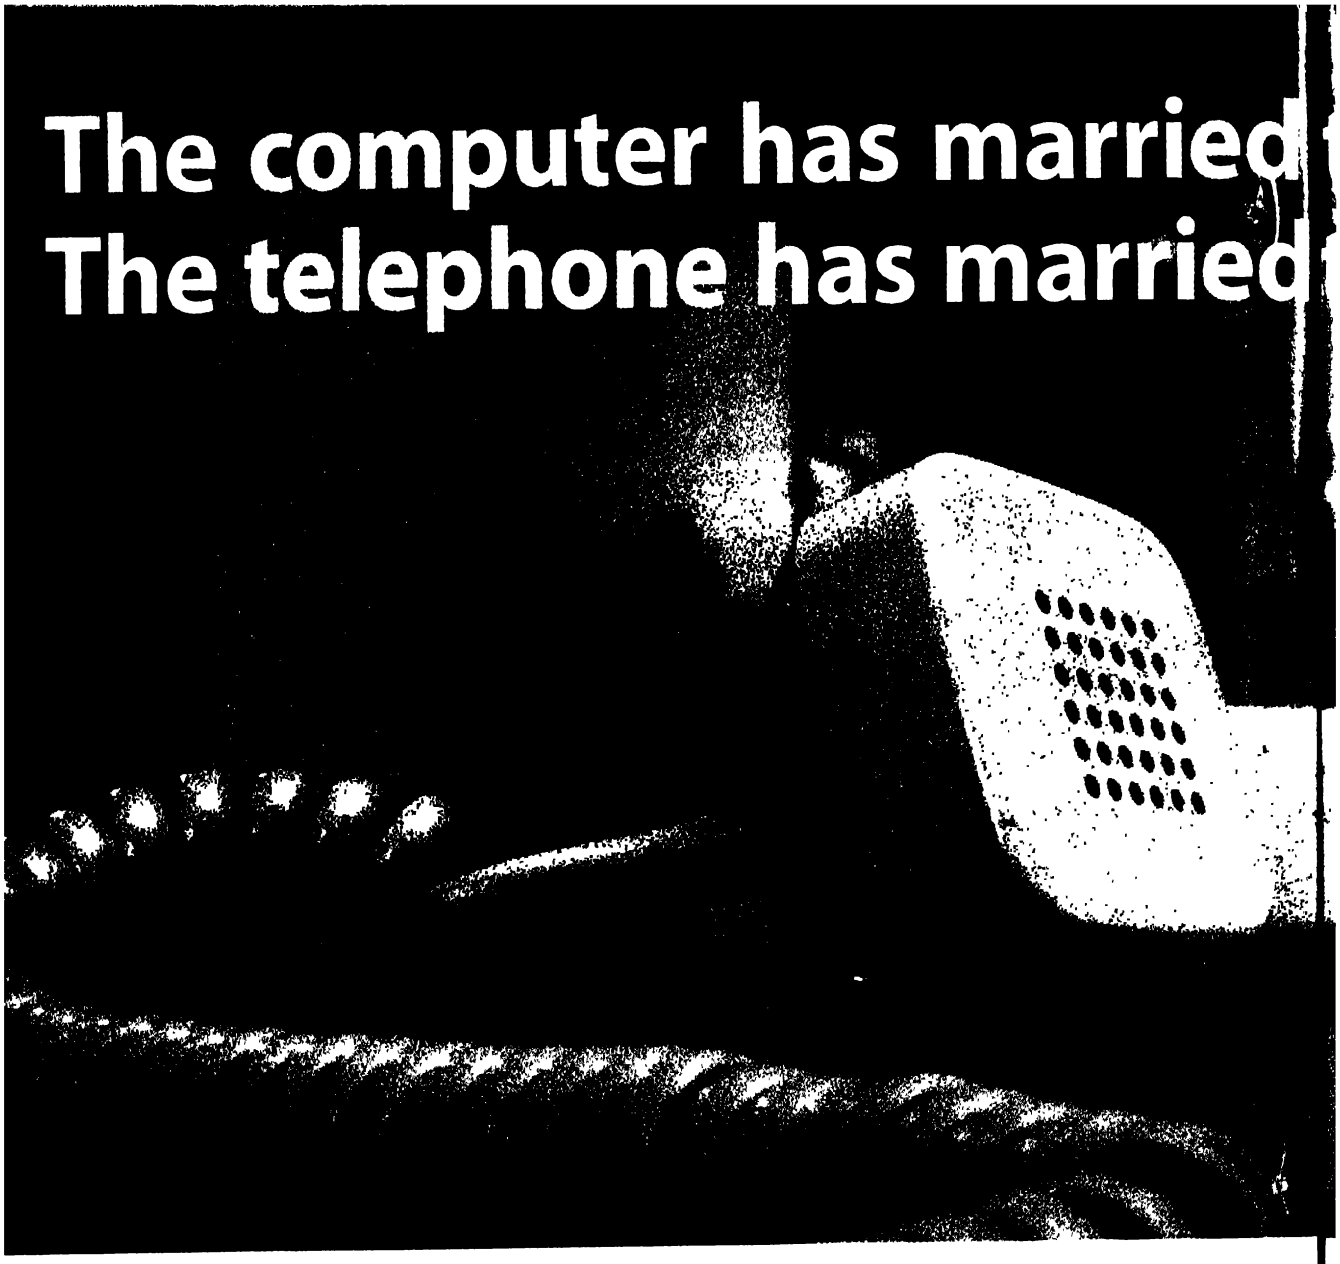
The software industry will be permitted to function in residential areas and included in the users' list for the No Development Zone. IT parks developed by the Maharashtra Industrial Development Corporation and the City Industrial Development Corporation (CIDCO) will be allowed 100 per cent ~ ra Floor Space Index at 25 per cent pre-m ium. The industry will not require permission to use agricultural land in residential areas. Software units will not require clearance from the Maharashtra Pollution Control Board. IT units in zones classified as A, B and C will be entitled to benefits that were reserved for units in the D zone. Sales tax on hardware has been reduced to 2 per cent and that on software to 1 per cent. There will be no sales tax on customised software. There will be no change in these rates for the next five years. The octroi on IT products will be refunded and electricity duty for IT units waived. Property transactions in IT parks will be exempt from stamp duty.

Many IT players have hailed the new policy and are positive about further growth of the industry in Maharashtra. Ashank Desai of Mastek said: "We have the largest presence with 85 per cent of the business in the State. We are undertaking further expansion in the Millennium Park in Navi Mumbai." Mastek is convinced that it needs to invest more in the State because of the excellent infrastructure. Infosys Technologies, India's number one software company, has also increased its presence in the State. It is investing Rs.60 crores in the first phase and Rs.130 crores in the second phase in the Pune Infotech Park.

Devang Mehta of the National Association of Software and Service Companies (NASSCOM) said: "The Knowledge Corridor will attract both local and overseas investment and NASSCOM is opening offices in the State. With leading educational and training institutes such as the Indian Institute of Technology, the National Centre for Software Technology (NCST), and the new institute for software engineering (in Pune), the State is the right choice to set up IT businesses. Onward Novell is setting up an institute for networking technology in the State, thus bringing in the best of networking technology of the world leader, Novell."

The Knowledge Corridor begins in Mumbai, the commercial capital of India, and passes through a number of IT centres up to Pune, a centre of learning. Mumbai is the largest single consumer of IT products and services and boasts of the first-ever IT zone, the SEEPZ. Now the zone is being expanded into SEEPZ++. The other landmarks along the corridor are the International Infotech Park in Vashi; the Airoli Knowledge Park; the Millennium Business Park in Mahape; the Dronagiri IT Hardware Park; the Talawade Software Technology Park, Pune; the Pune Infotech Park; Hinjawadi Phase I and Phase II; the Indian Institute of Software Technology, Pune; and the Centre for Development of Advanced Computing (C-DAC), Pune.

C-DAC has advanced the open-frame architecture for flexible supercomputing through the PARAM series of supercomputers. This allowed India to retain its position in the league of supercomputing nations. C-DAC has created software for personal computers in all Indian languages through its GIST technology. It has evolved a high-quality intellectual resource base in the form of an expert team with specialised knowledge of advanced computing. C-DAC has set up an Advanced Computing Training School to meet the training needs of existing and prospective users and for students of advanced IT.



The Maharashtra State Electricity Board (MSEB) and the State's Public Works Department and Irrigation Department will facilitate the laying of fibre optics cables by private Internet service providers or telecom service providers. While the MSEB has invited tenders, the other agencies will offer right of way to the IT industry at half the normal charges. The municipal corporations and municipal councils will be asked to allow the use of street-light poles to extend the fibre optic cable network or cable network for Internet connectivity.

The government proposes to set up computer laboratories at a cost of Rs.15 lakhs in 637 government and other schools, possibly with Internet connections, over the next five years. Aided schools will be encouraged to set up such laboratories through private participation. Teachers will be provided computer training. Engineering colleges will be encouraged to add on IT courses. A digital library will be set up in the University of Pune where English or Marathi-speaking users can access CD-ROMs and the Internet.

The government itself is emerging as the biggest IT user. It is trying to improve productivity and quality of service, make the administration more transparent and take IT to the common man. It intends to replicate the Warananagar Wired Villages project in other regions of the State. The aim is to computerise quickly those departments that have greater public contact, such as Sales Tax, Revenue, Health, Education, Irrigation and Public Works. Bulletin boards and public tele-info systems will be used to provide people instant information about government programmes, policies and procedures. Efforts will be made to increase computer literacy and accelerate proficiency. IT will be used to monitor government programmes and ensure speedy implementation of projects. The use of e-mail between the State headquarters and district-level and taluk-level offices will be made obligatory as part of a move towards achieving "paperless" offices.

The goals include providing the people of the State world-class IT infrastructure, putting in place the appropriate institutional mechanism, making people computer-literate, producing top-class IT professionals, and computerising citizen-government interface in order to make the government more transparent. ■

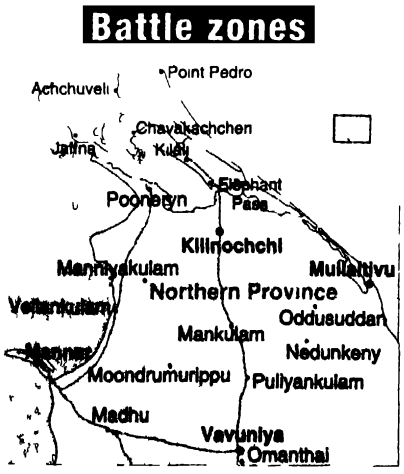
THA WALPOLA

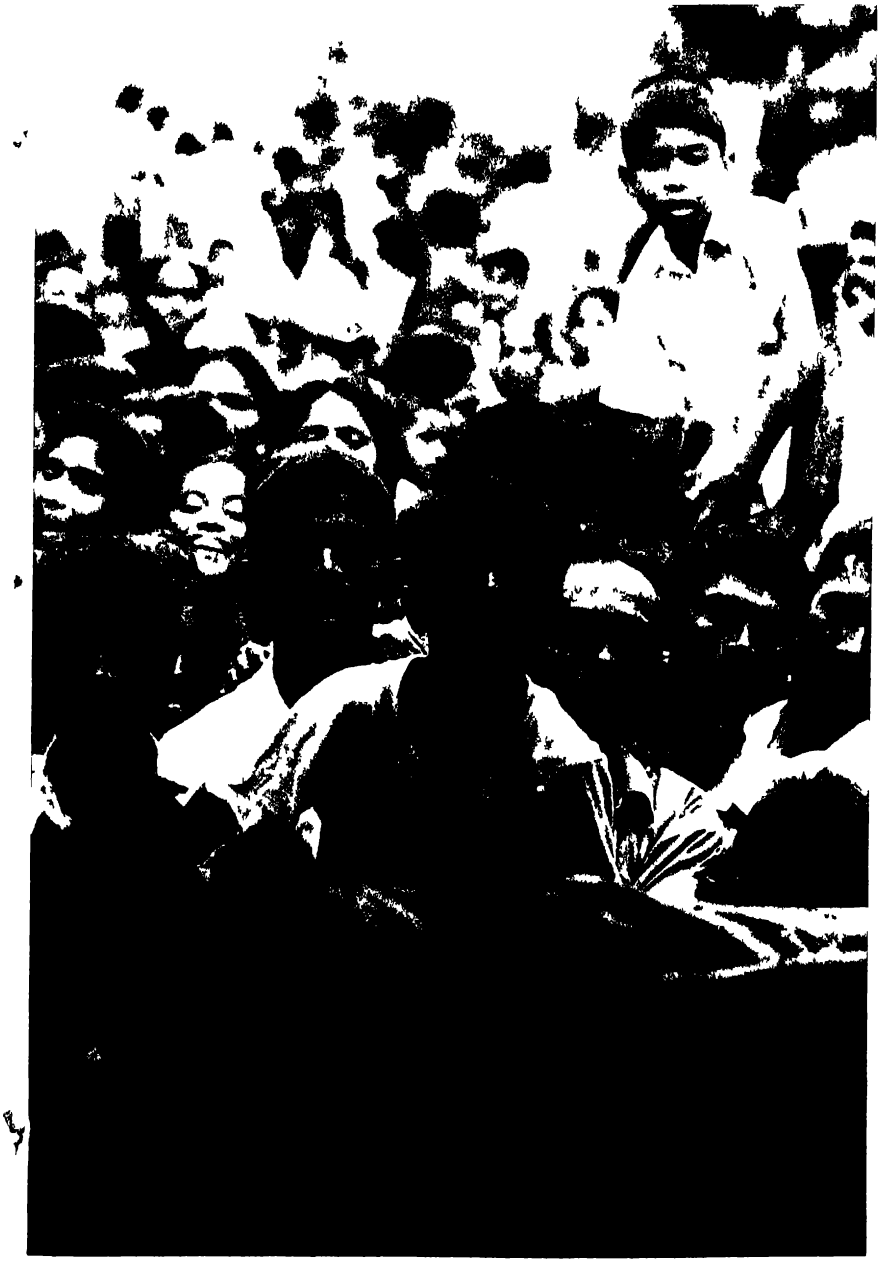


LTTE OFFENSIVE

With the Liberation Tigers of Tamil Eelam demonstrating its military resilience and marking major advances in the Wanni war, the avowed objective of President Chandrika Kumaratunga's war for peace stands exposed as a non-workable exercise.

D B S JEYARAJ

THE Liberation Tigers of Tamil Eelam (LTTE) launched on November 2 the third phase of Operation Oyatha Alaigal (Unceasing Waves) in the northeastern sector of the Wanni region in Sri Lanka's Northern Province. By November 15 the LTTE's positions had advanced in a southwest direction from Oddusuddan on the A 34 highway to the outskirts of Omanthai on the Jaffna Kandy A 9 highway. The Tigers also moved southwards on the eastern flank to the militarised settlements of Manal Aaru or Weli Oya. Vavuniya, the southernmost town of the Northern Province also came under threat.



After a brief respite, the LTTE recommenced its operations on November 18 by conducting assaults simultaneously on military positions in the northwestern sector of the Wanni region which comprises the districts of Mullaitivu, Mannar, Kilinochchi and Vavuniya. The Tigers captured several Army camps in these areas; they also took control of the famous Holy Rosary Church at Maruthamadhu, popularly known as Madhu. However, the Army recaptured it within 48 hours. In the process, 38 civilians who had taken refuge in the Catholic church were killed and 60 injured. The Army and the LTTE have blamed each other for the tragedy. The LTTE has also started attacking military positions on the island off Mannar on the northwestern coast. As of November 22, the fighting continued without any signs of abating.

(Top) An armoured personnel carrier of the Army proceeding to the battlefront in Vavuniya in November.

The first phase of Operation Oyatha Alaigal was conducted in July 1996 in

Mullaitivu. The Army camp there was demolished and the town fell to the LTTE. During the second phase of the operation in September 1998 the Kilinochchi military complex was overrun. More than 2,000 soldiers were killed in these operations. The armed forces have not been able to wrest control of these areas.

The third phase of the campaign has proved to be the most successful military offensive recorded by the LTTE in the entire history of the armed conflict. If one were to adapt Winston Churchill's famous line after the aerial battle of Britain in 1940 to the LTTE attack it could be said that never in the history of the Eelam conflict has so much territory been regained in so few days with so little losses by such small groups of Tigers.

After dislodging the Tigers from the Jaffna peninsula in 1995-96, the Sri Lankan forces had made several attempts to undermine their presence in the Wanni. The idea was to establish a land-linked route between Vavuniya, the southern point of the Northern Province, and the Jaffna peninsula through the conquest of the 77-km stretch of road between Vavuniya and Kilinochchi on the Jaffna-Kandy road known as the A-9 highway. After various operations which saw mixed results, the Army succeeded in taking a 44-km stretch of road between Vavuniya and Mankulam. Some of the key areas along this road that were under Army control were Omanthai, Puliyankulam and Kanakarayankulam. The Army had also made deep inroads into the northeastern sector of the Wanni, lying to the east of A-9 highway. Government troops had consolidated their positions in areas extending to the northeastern village of Oddusuddan along the A-34 highway linking Mankulam and Mullaitivu on the eastern coast.

Another series of operations saw the Army establish control over substantial areas in the northwestern sector of the Wanni, too. The place it took control included the Our Lady of Madhu church. One puzzling aspect of these operations was the lack of resistance by the LTTE in the early stages. But when the Army tried to take over the coastal Mannar-Pooneryn

Deputy Minister for Defence Anuruddha Ratwatte. He wanted a military drive although the rain had made the terrain difficult to wage a war. (Left) At Weli Oya, curious Sinhalese refugees look on as bodies of Tamil Tigers are removed from the war front.

road and establish another land route the Tigers offered resistance

SIGNIFICANTLY, the LTTE's record in the past year was marked by the conspicuous absence of military operations from November 1998. Its spokespersons abroad would maintain that the militants refrained from putting up any resistance for fear of endangering the peace initiatives. But the reality was that the LTTE, in typical guerilla fashion, was trading space to buy time. Ceding land made the Army overextend itself, by spreading thin over too much land, thereby increasing its vulnerability. On the other hand, the LTTE was quietly recruiting and training cadres, assembling weapons and arsenals and drawing up plans for a counter attack. The fact that the LTTE had allowed the Army to seize much territory without resistance had demoralised its supporters. In order to regain public support, the Tigers had to complete a military mission successfully.

The onset of the monsoon made the forest terrain sodden. The climate was not conducive to major military activity. Nevertheless, the Tigers had to launch a counter offensive, for politico-military reasons. The LTTE had originally planned its operation for November 11. Apart from being War Remembrance day, November 11 also marked the sixth anniversary of Operation Frogleap, the amphibian attack that demolished the Pooneryn-Nagathevanthurai military complex in 1993. By conducting a successful operation, the LTTE could create the ambience of victory that was necessary for Maaveerar Thinam, its annual Great Heroes' Day. After a military success, LTTE supremo Velupillai Prabakaran could deliver his traditional address from a position of perceived strength. The LTTE, however, advanced its operations in order to pre-empt any moves by the Army.

THE LTTE's military operation was preceded by an unusual manoeuvre by the Army. Starting in mid-October, the Sri Lankan security forces advanced along the old Kandy road from Karipputta-imurippu on the Mankulam-Mullaitivu road and established a permanent presence at Ambakamam. Subsequently, troops advanced from Oddusuddan on the east of Karippattaimurippu on the Mankulam-Mullaitivu road, known also as the A-34 highway. These troops established forward defence lines that were linked to positions at Ambakamam in a somewhat rectangular shape. On October 30 and 31, troops used this rectangular formation to push upwards in the direction of Muthaiyankaddu. After meeting stiff resistance from the militants, they returned to Ambakamam and Oddusuddan on November 1.

The Army operations in the Oddusuddan-Ambakamam sector were described as 'Operation Watershed'. The nomenclature itself was a give-away of the underlying compulsions for the operation. A presidential election was in the offing. The Chandrika Kumaratunga government was constrained to demonstrate through contemporary military successes on the ground that the Tigers were being defeated. Projecting such an image would have contributed immensely to an electoral success for Kumaratunga, it was felt. The People's Alliance (PA) government has on several occasions been criticised for setting up military deadlines to suit political timetables. Now the government needed a war victory during the election campaign. So, in spite of the adverse weather conditions, the Army was politically pressured to deliver militarily. Calling the operation a "watershed" suggested that the ultimate objective of the manoeuvres may be overrunning LTTE strongholds, including Prabakaran's "One Four Base". What was hopefully a politico-military watershed paved the way for the Waterloo that followed.

Once the LTTE anticipated Army expeditions, pre-emptive strikes became

SPYANTHA WALPOLA

Major-General Niel Dias, the new Army Commander for the Wanni region.

imperative So the D Day of Unceasing Waves-III had to be advanced On November 1 the LTTE held a top-level conference in the historically significant Katsilaimadhu located north of Oddusuddan and south of Puthukkudiyiruppu Pandara Vanniyan, the legendary Vanni chieftain of Adankapattu who ruled in Panankamam, was defeated by British troops led by Major Dieberg at Katsilaimadhu A stone inscription as well as a statue erected about 20 years ago bear testimony to the heroic image of the last feudal ruler, who defied the imperialist aggressor Katsilaimadhu witnessed another historic occasion on November 1 Prabakaran, along with his senior deputies, was there to finalise plans to launch Oyatha Alaigal Several Tiger commanders, such as Balraj, Karuna, Sornam, Jeyam, Bhanu, Theepan, Rabat, Nagesh, Anton, Selvarajah, Asha, Durga and Malathie, were present at the conclave Even as the meeting was on, thousands of male and female cadres secretly converged on Muthaiyankaddu, Sammalankulam, Mulliyawalai, Thanneerootru, Katpoorappulveli, Kodalikkal, Indimadhu and Thanduvan They were drawn from different fighting formations, such as the Charles Anthony and Jeyanthan infantry divisions, the Sothiya Women Corps, the Kittu artillery brigade, the Victor armoured corps, the Leopards Commando unit, the Black Tiger suicide squads and the anti-aircraft unit There were also members from auxiliary civilian units

Prabakaran was both the architect and the chief executive of the operation Tiger literature claims that the entire operation was guided, inspired and masterminded by the leader who is also the supreme commander of LTTE forces The LTTE's deputy military commander-in-chief, Balraj, a son of the Wanni soil, was in charge of coordinating the operational headquarters Karuna, a senior commander from Batti-caloa was the overall field commander Once Prabakaran gave the go ahead, the Tigers started their operations

The first target was Oddusuddan, which was seized by the Army 1st December in Operation Revibalaya (Solar Power) Oddusuddan was guarded by the Second Gajaba Regiment on the west and the Walagambaya division of the Navy on the east Incidentally, three naval divisions were deployed on land duty in the eastern sector of the Wanni Likewise, Air Force divisions were on duty in the western sector Both services were being used as supplementary ground troops, to assist the Army The western and eastern Wanni sectors were demarcated by the A 9 highway, which bisects Wanni

An LTTE commando unit infiltrated the Army lines on Manavalanpattaimurippu on the Mullaitivu road, west of Oddusuddan Around midnight, the unit attacked the Gajaba troopers from behind A little later, three formations of LTTE fighters attacked the camp from all three sides After nine hours of fighting, the LTTE overran the Oddusuddan camp The Gajaba soldiers and the Walagampaya naval personnel were virtually annihilated A fresh column of LTTE cadres, along with the civilian militia, came in a motorcade from Mullivawalai and hoisted the Tiger flag It is said that Karuna performed the honours Thereafter, the Tigers and their civilian militia began transporting by road to Mullaitivu the vehicles, arms, ammunition and equipment seized

The Tigers then proceeded in three directions to the northwest towards Ambakamam westwards to Karippattaimurippu and Olumadhu, and to the southwest to Nedunkeny Nedunkeny was taken in the preliminary stages of Operation Jeyasikurui in May 1997 It is situated on the Puliyankulam Mullaitivu road and is the interface of Vavuniya and Mullaitivu districts It is very much the gateway to Mullaitivu or the Tiger heartland The access route between Oddusuddan and Nedunkeny had the 3rd battalion of the Sinha Regiment at Samanankulam and the 8th battalion of the Vijaybahu Regiment at Pandarikulam After some fierce fighting,

LTTE supremo V. Prabakaran, the chief executive of Operation Oyatha Alaigal III.

Caught in the crossfire in Vavuniya

V S SAMBANDAN
recently in Vavuniya

CAUGHT between despair and hope that sums up the state of the residents of Vavuniya. The sound of heavy artillery sends them helter-skelter, whether it is day or night.

Vavuniya's woes started in early November when the Liberation Tigers of Tamil Eelam embarked on its offensive in the Wanni region. When Operation Oyatha Alaigal began along the eastern flank of the Kandy-Jaffna road (A-9 highway) the residents were cautiously optimistic that their town would not be affected. However, in just over a week they found themselves packing their belongings and proceeding to areas specified by the LTTE. The LTTE, in broadcasts on the Voice of Tigers (VoT), asked them to shift from Vavuniya town, Pandarikkulam, Katkuli, Thonikkal, Vairavapuliyankulam, Pattanippuram, Veppankulam, Nelukkulam, Thandikkulam and Pathinarmagilamkulam, as the Army camps there could be shelled. The safer places it suggested included Aasikkulam and Rajendrakulam.

A few days after most of the town's residents, estimated at around 80,000, had evacuated, another LTTE broadcast asked them to shift back to their homes but warned them to keep off the Army camps. (No correct estimate of the population figures of Vavuniya is available, and this confirms the distancing of the northern districts from the rest of the island. As no census was taken in the northern and eastern areas since 1981, actual population estimates vary from the figure provided by the Government, which is 50,000, to that mentioned by relief agencies, 1,00,000.) The confusion over numbers notwithstanding, it was a matter of grave humanitarian concern.

The residents of Vavuniya did as they were told. The Tigers ensured that their word was taken as a command by the civilians in the government-held areas. The military aggression of the days preceding the announcement only reemphasised this. I did not personally hear the LTTE announcements, but I was told that the leader wanted us to move. So I obeyed. Then, he wanted us to return. We did so," said a resident of Vavuniya. Some Tamil leaders were of the opinion that the LTTE carried out the entire Vavuniya exercise just to prove a point. "It caused so much of misery to the people to prove the point that its word carried weight."

THE majority of people who fled Vavuniya during the current offensive were those who had sought refuge in the town after their lives were disrupted in an earlier offensive elsewhere in the north. Thousands of people – students and traders, landlords and the landless, professionals and casual workers, government employees and shopkeepers – who were uprooted from the battle-scarred northern districts had only started life anew in Vavuniya.

On November 11, when the LTTE asked them to move out, they were confused. Did the Tigers mean what they said? Was it a ruse to send the Army into panic? Was it a rumour spread to cause confusion? However, all doubts ended the following morning.

Civilians in makeshift tents outside Vavuniya.

Moving out of the heavily fortified town was the first priority. "Those of us who have passes (issued by the police) can go to Colombo, but others would have to stay behind," was the initial reaction.

"I am going to lock my house and flee. In which direction? The Tigers have specified some locations. We will follow their instructions," a watchman of a lodge in the town said.

IN Rajendrakulam near Vavuniya, a new settlement had come up overnight. Several families were living under extreme odds – under trees or bullock carts, in makeshift huts, in semi-finished houses and in thatched-roof schools.

"I have been on the move since the 1970s," said I. Sabaratnam, a former employee of the Excise Department He has practically lived out of his suitcase, having moved to whichever area the displaced people were sent to. The exodus from Vavuniya brought luck to Sabaratnam, who now owns a soft drink stall. "Look at the wares I sell," he said pointing to the stacked-up bottles of aerated drinks and household goods. "Traders from Vavuniya sold them at rock-bottom prices. They just wanted to sell their stocks and take the money before fleeing." With a shop located in a displaced region, finding buyers could well turn out to be his next problem.

Along the dirt track that runs across Bharatipuram, another location near Vavuniya, families live in tents, children play in makeshift swings and men huddle around a tea-stall.

"Whether we have money or not, what we need is passes," said Thurairaja, a former resident of Jaffna. For people like him who have been constantly uprooted, the main concern is to ensure that all members of their family have passes. "Only that will ensure that we travel together." In the militarised zone, only civilians holding a pass issued by the police can move about freely. People without passes could be taken for militants.

"Imagine carrying passes in one's own land. I was leading a comfortable life in Jaffna. I owned a car, my family was well-settled. The troubles began and we left. Now I work as a mason. But there is not enough work."

For Shah Jahan, who fled Jaffna after the LTTE began its ethnic-cleansing, his family's return to Vavuniya would be determined by the Tigers. "If they remain in the area, I will not come back," he said, as he waited for a bus to take his family to the Muslim-majority Puttalam town.

Voluntary organisations gave priority to providing shelter. But those who wanted tents were required to produce their passes and register themselves with government officials.

Dharmalingam, a leftist now in his sixties, is in a tearing hurry. "I have a list of 70 people. I want to ensure that everybody gets some kind of shelter. Let us go fast, the officials may go away," he says as he gathers a group of people. At the makeshift office, an empty desk awaits him. "They have gone," a 50-year-old widow tells him. "I have to come back. I hope it does not rain (for the people have no roof over their heads)," he says. He added: "Some of the former militant groups have helped us. The houses, which are yet to be completed, were built at the initiative of the members of Parliament belonging to the People's Liberation Organisation for Tamil Eelam (PLOTE)."

At Bharatipuram, cadres of the Tamil Eelam Liberation Organisation (TELO) were overseeing mass cooking for the displaced. "We are trying to do our best. Some rice, some curry, some vegetables," says Ganeshamoorthy, urging the workers to finish the task fast. As the rice boils, there is a cloudburst. A heavy downpour sends the people running for cover. And with that goes the hope of a meal.

SRIYANTHA WALPOLA

The exodus from Vavuniya following an LTTE broadcast asking residents to leave the town.

THE situation in Vavuniya changed rapidly when the Tigers asked the displaced people to return to the town on November 17. The residents returned to their moorings, to begin the process of normalcy. But this was shattered by incessant shelling of Army positions north of Vavuniya. A shell which landed at Thonikkal, on the outskirts of the town, killed a child and injured three persons. Panic set in again with hundreds of civilians taking shelter at a church in the town. "We do not stir out after dark," said Ganesh, a casual worker. After dusk, the roads are largely deserted, with most people choosing to stay indoors.

In the areas near Vavuniya, an uneasy calm prevailed. "We don't know what will happen next," said a shopkeeper at Medawachchiya, south of Vavuniya.

Rather than the threat of a Tiger advance, it is the refugee influx that is a matter of concern for the people living in the vicinity of Vavuniya. In Anuradhapura, further south, Sinhalese residents of Vavuniya had sought refuge with their friends and relatives.

The Army maintains a nervous vigil, checking all those who enter or leave the town. At a checkpoint outside the town, students wait for some mode of transport to take them to safety. Resumption of normal life depends on the course the conflict would take next. ■

Nedunkeny also fell to the LTTE.

In the meantime, the other two Tiger columns were confronting two naval divisions stationed on the western flank of the Mullaitivu-Mankulam road on the one hand, and the 55th division personnel on the Ambakamam rectangle, on the other. After heavy fighting, Karippattaimurippu fell. Then the Tigers proceeded along the old Kandy road towards Ambakamam while other formations kept pounding Olumadhu adjacent to Karippattaimurippu on the road between Mankulam and Mullaitivu. Reinforcements sent from Mankulam were prevented from reaching Olumadhu as Tiger commandos blew up a bridge over a tributary of the Kanagarayankulam.

Soon Ambakamam fell, and it was followed by Olumadhu. Thereafter, advancing LTTE personnel began pounding Kanagarayankulam and Mankulam, both on the A-9 highway. Shortly thereafter, Mankulam fell. The Tigers then started proceeding southwards by vehicles along the Jaffna-Vavuniya road. Government troops had captured the stretch of roadway between Vavuniya and Mankulam in Operation Jeyasikurui after 19 months of fighting. Now the Tigers were merrily cruising along the stretch. Some rearguard action was proffered at Kanakarayankulam, the headquarters of the 56 Division manning the eastern Wanni sector. But the following day, Kanakarayankulam too fell. Then the Tigers went further south to Puliyankulam, which also succumbed the same day.

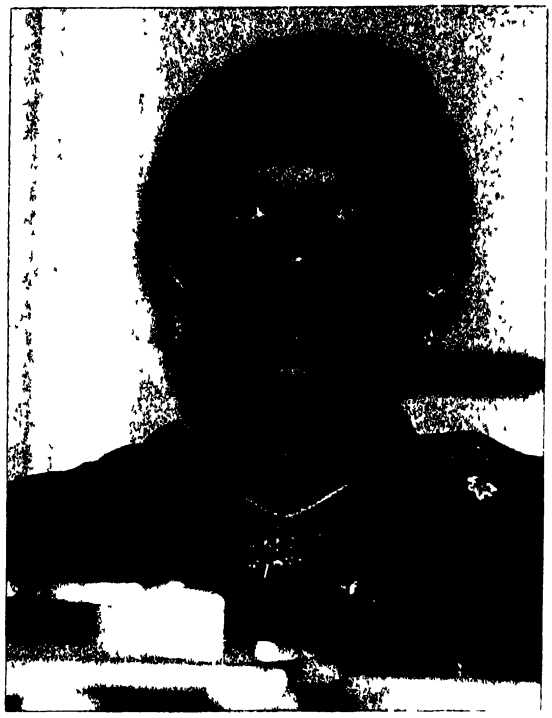
Finally, on November 7, the LTTE reached Panickaneeraavi on the outskirts of Omanthai, 15 km south of Vavuniya. Omanthai too had been captured by the Army in May 1997. The rapidly retreating troops finally dug in at Omanthai. Reinforced by troops from Vavuniya and artillery field guns, the Army began defending Omanthai. Other places where some resistance was displayed were Madhiyamadhu and Nainamadhu on the Puliyankulam-Nedunkeny stretch; Othiyamalai and Pattikkudiyiruppu in the Nedunkeny area; Karappukuthi and Katkidanku near Kanakarayankulam; and Semamadhu near Omanthai.

The LTTE has also seized some points on the western sector or areas to the west of the A-9 highway. Moondrumurippu near Mankulam, Mannakulam near Kanakarayankulam and Puthoor near Puliyankulam have been seized. Some Air Force personnel and soldiers were killed or injured.

The LTTE has also begun artillery attacks on Pallamadhu and Palampitty in Mannar. Both these places are of strategic importance in the context of an attempt to take the Mannar-Pooneryn road. After Operation Jeyasikurui aimed at securing the A-9 highway was aborted, the Army had launched a series of operations, named Ranaghosha, or battlecry, and seized a lot of territory and vast stretches of the Pooneryn road. It was said that the objective was to utilise the Mannar-Pooneryn road as the land route to Jaffna.

The government began its manoeuvres in the Wanni with the launching of Operation Jeyasikurui, but called them off in December 1998. The operation had seen the Army sustain tremendous losses, with the LTTE taking to positional warfare by defending entrenched positions. Now, after the first stage of Oyatha Alaigal-III, the Army has lost 30 km of the 44-km stretch it had seized on the A-9 highway and, according to preliminary estimates, 1,269 sq km of territory on the eastern Wanni front. It has lost in just a week areas annexed over a period of two and a half years: the losses include 10 bases, 24 camps, 116 posts and an unknown number of bunkers. Massive amounts of arms, ammunition, equipment, tanks and armoured cars and other vehicles were seized by the Tigers. So too were large amounts of dry rations. Although the Government puts it at unbelievably low levels, the Army and the Navy have lost more than a thousand men, Opposition parties allege. The LTTE claims that its losses are only in hundreds.

The more significant aspect of the fighting was the fact that the LTTE adopted conventional techniques to chase the Army out. Thousands of troops literally ran away instead of fighting. There have been reports of rebellion, in some places of which officers and military policemen



SRIYANTHA WALPOLA

were shot. Large-scale desertions have occurred. There has been a breakdown in discipline. In short, the Army, despite its numerical and logistical superiority, has been decisively routed. How did this happen?

TWO developments occurred on the first day itself, and these had important consequences in the course of war in the immediate future. First, the LTTE used newly acquired anti-aircraft weapons to bring down two helicopters and damage a plane. The Air Force panicked, thinking that the Tigers possessed the ability to blast planes in the skies. The Air Force suspended all active engagement in the conflict for more than a week. Thus the beleaguered ground troops on different fronts in the eastern Wanni sector could not receive assistance from the Air Force for quite a while.

Secondly, the officials in Oddusuddan hastily loaded a South African "Buffel" tank with all communication codes and signal crypts and tried to send it to the 56 Division headquarters at Kanakarayankulam after their camp came under attack. The tank got bogged down in the slush. As the troops abandoned it, the Tigers seized it. Using the codes, the LTTE began penetrating the radio communications system of the Army. As a knee-jerk reaction, the Army stopped all internal communications. The communications equipment within the combat zone went dead for several days. As a result, panic and confusion set in among the troops.

The primary cause for the debacle was the suspension of aerial contact and radio communications. Without a proper leadership issuing directives or morale-boosting reassurances, the individual Army detachments began withdrawing. Several officers had begun retreating, instead of urging the soldiers to stand and fight. The Government's refusal to accept the bodies of soldiers from the LTTE in the conflict zone also fuelled troop resentment. A collapse of logistical support hampering transport, food supplies and medical treatment also created a demoralising impact. After fighting at Oddusuddan and a few other places, the soldiers preferred "flight" to "fight". An angle being probed by the Government is sabotage and propaganda by pro-United National Party (UNP) elements. It is suspected that some officers who support the main Opposition party had sabotaged the war effort.

Chandrika Kumaratunga. Her avowed objective of war for peace appears non-workable.

The primary cause for the debacle was the suspension of aerial contact and radio communications. Without a proper leadership issuing directives or morale-boosting reassurances, the individual Army detachments began withdrawing.

In its anxiety to find scapegoats, the Government has transferred all senior commanding officers. But there is criticism of the political leadership itself. Many intelligence warnings went unheeded because the Government wanted a quick military victory to boost its chances in the presidential election. Monsoon rain had made the terrain in the Wanni region difficult for military operations, but Deputy Minister of Defence Anuruddha Ratwatte wanted a military drive. Hence Operation Watershed was launched to take Ambakamam first, and follow it up with further incursions. The stationing of troops on the outer perimeter endangered other points, which the Tigers exploited. Another reason for demoralisation among the troops was the realisation that they were being cynically expended in a war that had the ruling party's electoral victory as its ultimate motive. According to Lasantha Wickrematunge, editor of the pro-UNP newspaper *Sunday Leader*, "The Government has to face the fact that the defeat was a result of bad military planning. The soldiers deserted because they realised they were not fighting a war to save the country but to further the interests of a particular political party."

THREE salient points that contributed to the LTTE successes were tremendous artillery barrages, the rapid mobility of personnel and vehicles, and expert tactics. After the initial stages, the element of surprise was no longer there: thereafter it was only superior mobility, better tactics and the precise use of artillery that mattered. The very same weather conditions that affected military movement did not hinder the Tigers. Also, the LTTE allowed the retreating soldiers an escape route in most cases instead of trying to surround and decimate them. This led to most soldiers opting to run away rather than fight. It must be noted that in many earlier operations, the denial of escape routes by the Tigers contributed to soldiers rallying and fighting a literal battle for survival, thereby preventing an outright LTTE victory.

Another area where the LTTE made an impact was Weli Oya or Manal Aaru. This strategic region was carved out by the UNP, with the objective of ending the territorial contiguity of the Northern and Eastern Provinces.

The P.A. Government, after the initial successes of Jeyasikurui, embarked on implementing the scheme of colonising armed settlers and establishing a network of camps. It must be remembered that Tamil inhabitants were driven away earlier in a systematic form of ethnic cleansing. The LTTE has succeeded in destroying several camps in Weli Oya and continues to put pressure on the region. More than 7,000 Sinhala settlers have fled the area.

VAVUNIYA, the southernmost town of the Northern Province, too is under threat. The LTTE announced that it was going to shell the town and asked residents to move away. This led to about 9,000 people abandoning the town (see

separate story). Fearing a major assault, the armed forces gathered in large numbers in Vavuniya, transforming it into a garrison town. Instead of organising a swift counter-attack, the Army focussed its energy on protecting Vavuniya.

THE objectives of the LTTE in triggering such an exodus are yet to be revealed. It is, however, assumed that by threatening to invade Vavuniya, the Tigers succeeded in stalling government efforts to mobilise a swift counter-attack in the areas that were lost. Instead, it has concentrated personnel in Vavuniya. This gave the LTTE time to transport the arms and equipment that were seized and to revise its defence structures. Since the Tigers had not bargained for such early gains, they need time to consolidate and build defences to retain seized areas. They also need time for logistical preparations to continue their operations.

Given the prevailing low morale and poor fighting spirit among the armed forces, the LTTE decided to strike again. After a brief period of "rest" between November 9 and 17, the Tigers recommenced operations, in the northwestern sector this time. A number of military positions were attacked simultaneously. Most of these camps had been established on interior roads after different stages of Operation Ranaghosha. They were extremely vulnerable, being mere "islets" of troops in a surrounding "ocean" of LTTE-infested jungle terrain. They served very little strategic value. But to a government wanting to impress Sinhala voters with the extent of "real estate" acquired from the LTTE, it became a necessity to retain these camps. In the process, the Army spread itself thin and played into Tiger hands.

The LTTE took over a number of camps in a matter of days with comparatively little bloodshed. A repetition of the earlier pattern of soldiers deserting positions on their being pounded by artillery was quite evident. Areas such as Palampitty, Thatchanamaruthamadhu, Palamottai, Vaarikkuttiyoor, Navvi, Periyathambanai, Periyapandivirichan, Sinnapandivirichan and Periyamadhu were overrun with comparative ease. One area where the LTTE met with stiff resistance was Iranailuppaikulam. The large base there proved to be formidable. With Army reinforcements having been sent to Iranailuppaikulam, fighting continues in the area.

On the Mannar-Pooneryn road, the strategic junction of Pallamadhu was taken, along with Pappamottai and Naayaaruveli. Although the LTTE is yet to gain a permanent presence on the Vavuniya-Mannar road, it has succeeded in driving the Army back from most areas to the north of this road. The Army now retains positions only on this road and has forbidden civilian movement on it.

Emboldened by these successes, the LTTE began an artillery attack against the main camp at Thallady in Mannar district. Thallady guards and controls the causeway to Mannar island where the important town of Mannar is located. The Tigers also shipped field guns to Erukkalampitty on the island and began attacking the Army camp at the Mannar Fort premises. Later, Sea Tiger boats from the Nachikkudah base tried to invade the island at the Pallimunai coast.

Another controversial and sad event was the attack on Madhu (see box). On November 18, the LTTE surrounded the outlying areas of the church. The Army left the church premises. The Tigers did not stay in the church, in deference to the wishes of the priests. On November 20, a commando unit stormed their way into the church. About 3,500 refugees were asked to sleep inside the church and the adjoining Sacred Heart Chapel. At about 10-15 p.m. there was some shelling. The Army says that the LTTE fired the shells. The Tigers say that the Army had tried to move on to Palampitty and were repulsed by them. They maintain that the retreating soldiers had trained their tanks on the chapel.

Since fighting continues in the northwestern sector and positions are fluctuating, it is not possible to assess the total situation. But the LTTE does seem to have retaken 800 to 900 sq km of territory at least in this second stage of its operation. Three major camps at Periyamadhu, Periyathambanai and Palampitty, along with a number of smaller ones, have fallen. Neither the rate of casualties nor the nature of the military tactics adopted by the LTTE is known. But the important question is why the military debacle was in such colossal proportions. In the first stage, of course, there was the element of surprise. But after the fighting started, the other camps should have been vigilant and prepared.

THE major consequence of this military campaign is that the LTTE has demonstrated its military resilience once again. The avowed objective of Chandrika Kumaratunga's war for peace stands exposed as a non-workable exercise. Even if the Tigers are compelled to relinquish the newly taken territory, they have very effectively made the point that the organisation simply cannot be undermined gradually. Also, no strategy based on the ephemeral conquest of territory is workable. As such, bold and creative alternatives for a resolution of the conflict will have to be found in the long term. In the short term, the fighting will continue.

The Army's reversals have encouraged the Opposition leader Ranil Wickremasinghe, who is the chief opponent of Chandrika Kumaratunga in the presidential election. The UNP chief hopes to hold talks with the Tigers, if elected. He says that there is no military solution to the ethnic conflict and that the Tigers cannot be wished away. The LTTE has to be politically accommodated. The military reversals have considerably diminished Kumaratunga's expectations and increased Wickremasinghe's. The boundaries are now back to where the Wanni hostilities began, and all the gains by the Government have been negated. But excessive victories by the LTTE may provoke a Sinhala backlash, which may result in Kumaratunga doing well.

The Sri Lankan Tamil diaspora too is elated. Being hopelessly unrealistic and uncompromisingly intransigent, these sections now feel that Eelam is just around the corner. Despite being witness to so much territory change hands so many times, these elements construe the latest Tiger successes as an indicator of ultimate victory over the Colombo Government. That the LTTE leadership itself neither expected nor prepared itself to acquire so much territory in such a short time is lost on these sections. The very same sections that were shouting themselves hoarse calling for peace talks are now using jingoistic statements: no need for talks until Eelam. Also, massive fund-raising campaigns are being undertaken successfully.

The strategy adopted by the LTTE for the greater part of this year was perplexing. Nevertheless, with the wisdom of hindsight, it is clear now that the tactics worked.

Now it is Chandrika Kumaratunga's turn. With the presidential election just around the corner, she would be constrained to launch some dramatic counter-attacks, if possible. This is a risky – and from a humanitarian perspective unacceptable – option, but there does not seem to be any other way out for her.

So the cycle of violence will continue. It remains to be seen when the Sri Lankan forces will start their operations and how the Tigers will react. ■

The northern aggression

The message from the military operations in the Wanni region is that only a political solution will result in a permanent end to the hostilities.

V.S. SAMBANDAN
in Colombo

"Wars have never hurt anybody except the people who die."
– Salvador Dali

THE separatist Liberation Tigers of Tamil Eelam (LTTE) has redrawn the military map of the northern territory of Sri Lanka by recapturing within the first two weeks of November areas that were taken by the Sri Lankan Army through various military operations over the past two years.

Before Operation Oyatha Alaigal III started, the military map was a matter of satisfaction for the troops. But within days, Army camps fell like nine-pins. Areas that had been captured by the Army, some of them in difficult battles, during its military campaigns, were retaken by the militants with remarkable ease. Oddusuddan, Nedunkeny, Olumadu and Mankulam, important military camps that the Army had established after beating back the Tigers, fell in rapid succession. Puliyankulam and Kanakarayankulam, among the strongest and best-fortified Army outposts along the Jaffna-Kandy highway, were among those that were captured. For over a year since May 1998, this road had witnessed the troops inching forward, fighting to open a main supply route to the northern Jaffna peninsula, which it had regained from the Tigers.

Embarking on their latest thrust along the main highway, LTTE cadres swept vast tracts of land to the east and west of the A-9 highway and took control of several strategic towns. For all practical purposes, the government's military gains, built up over the years, were lost.

The island, especially the southern region, was preparing for the presidential election when the LTTE launched its offensive. For well over a year, the Tigers had been at the receiving end.

Some military observers feel that the timing of the operation had nothing to do with the presidential election. "The main and the only motive was military," said a former militant. "The LTTE wanted to make the maximum haul of war equipment. It would have anticipated a further thrust towards Mullaitivu ahead of the election. Hence the attack on Oddusuddan," he reasoned.

Military officers are of the view that the LTTE would have conceived a smaller operation but enlarged it after seeing the effectiveness of the attack. "They have got more than what they would have expected," he said.

Although the fighting capability of the Tigers is considered formidable, such a sudden loss of territory by the Army,

SRIYANTHA WALPOLA

Army patrolling in a deserted Vayuniya town.

apparently without even putting up a fight, has caused concern. While Opposition leaders have alleged that the Government's strategy of gaining more territory was the reason for the "thinly spread out" nature of the Army's presence, sections of the Government see a possible political conspiracy behind the military debacle. The Defence Ministry promptly appointed a court of inquiry comprising senior officers of the Army, the Navy and the Air Force to investigate the reasons for the debacle. Even as this professional exercise was under way, damage-control measures were initiated.

Censorship on military news, which was in place since June 1998, was further tightened. Sections of the national media were accused of providing grossly exaggerated and misleading casualty figures. The concern was more on keeping down the reported number of soldiers killed in action.

War casualties were contained by resorting to what has been described as "tactical withdrawals". "This is now an artillery-based aggression by the Tigers. There is less of man-to-man combat and that would explain the relatively lower numbers of casualties," said a military official. Initial estimates placed the number of soldiers killed at 101 and those missing in action at 743 in the five-day offensive.

Military commentators were also quick on the draw. In their analysis, it was the strategy of massing military personnel in the north for a push against the Tigers that led to the debacle.

"They have been gaining territory without a fight," said an analyst, referring to the Ranaghosa operations. It was during these operations that the Tigers withdrew from Oddusuddan and other areas, helping the Army to move in with relative ease.

As the Tigers moved out without offering resistance, it was reasoned, "they were able to keep their fighting units intact." "As the Army had to hold the territory it had gained, it was bound to spread its forces thin. Moreover, the Army had not won major victories by inflicting losses on the Tigers. This meant that the LTTE could strike back with full force," a military commentator told *Frontline*.

The Army's fighting units in the north also came in for a restructuring in the com-

A news black-out on military matters

V.S. SAMBANDAN

FACTS are invariably the first casualty of a war. Objectivity comes next. Then those killed in combat are reduced to mere numbers, and the ones missing in action are lost in a procedural maze.

When the Sri Lankan Government in June 1998 clamped censorship on all news relating to military activity in the country, it did what many countries of the world have done during an escalation of armed conflict. Censorship was in place for a brief period in 1995, during the Army operations in northern Jaffna.

If restrictions on access to the conflict zones and a military censorship of all war-related news ensured that the state had defined in clear terms the limits to the people's "right to know", a ban on the Liberation Tigers of Tamil Eelam (LTTE) completed the picture. Effectively, the ban made access to the Tigers, in any manner, illegal.

In fairness to the People's Alliance (P.A.) Government, its record on the human rights front – specifically that pertaining to the unhindered working of journalists – is a vast improvement over previous regime's. Reports of the disappearance of journalists critical of the establishment are now a thing of the past. During its early days, the P.A. Government permitted private radio and television stations to present news and current affairs programmes – an area that was until then restricted to the state-run media.

A relatively free atmosphere prevailed until the LTTE turned its heat on the government. In a situation where access to the war zone and areas held by the LTTE was restricted, the statements issued daily by the Defence Ministry formed the key source of information. The LTTE's press releases, normally faxed to newspaper offices, gave the rebel version.

In such a restricted atmosphere came the added limitation of the news censorship. Initially, a military officer was made the Competent Authority to judge the suitability of the news. Later a civilian authority was vested with the responsibility.

The Government was concerned mainly about reports on casualties. Needless to say, sordid media reports of soldiers dying in large numbers would have had a significant political impact. The stated reasons for the imposition of censorship, however, are "strategic" factors: it is claimed that in the absence of restrictions the media would through their reports of the war provide leads to the "enemy" on the moves of government troops.

The clamping of censorship has often come in tandem with setbacks suffered by the security forces. For instance, the censorship apparatus was activated when the Tigers overran the northern town of Kilinochchi and during the Operation Watershed III battles. In stark contrast, when Sinhalese civilians were reportedly hacked to death by Tamil militants in the eastern town of Amparai in September, the national media, including the state-run media, went to town with gruesome pictures of the victims, in violation of the censorship regulations. The Government ferried a group of journalists from Colombo to Amparai.

Censorship was last imposed in June 1998 and its vigorous implementation happened in two phases: between June and December, when Operation Jayasikurui was in progress, and around the time Operation Oyatha Alaigal III commenced.

The Government is, however, in a fix: the British Broadcasting Corporation (BBC) has a contract with the state-run Sri Lanka Broadcasting Corporation (SLBC), under which the BBC has acquired air-time on SLBC on the condition that its programme will be broadcast as presented. In contrast, when telecasts of overseas news organisations, mostly Indian and British, are repeated by the island's private media, matters relating to Sri Lanka are often blurred out. There have been knee-jerk reactions as well. The blacking out of an overseas television story on the positive aspects of the Sri Lankan economy is a case in point.

In yet another instance, the Sri Lankan Customs held back Indian publications when people evacuated from Vavuniya after being asked to do so by the LTTE. Customs officials refused to clear the newspapers and

mand, the most significant step being the replacing of the Commander of the Security Forces in the Wanni, Maj. Gen. Wasantha Perera, by Maj. Gen. Neil Dias. Senior military leaders in Colombo, including Lt.Gen. Sirilal Weerasooriya, the Army Commander, and Major General Lionel Balagalle, the Chief of Staff and until recently the Commander of the Security Forces in the Wanni, reached Vavuniya to oversee the operations.

By the turn of the week, the LTTE had reached Mankulam on the Jaffna-Kandy highway. Mankulam was won by the Army last year, when the Tigers overran Kilinochchi during Oyatha Alaigal II, inflicting heavy casualties on the Army. With the retaking of Mankulam, the LTTE consolidated its presence on the Jaffna-Kandy highway and pushed its territorial gains further south.

SRIYANTHA WALPOLA

Security check in Colombo.

Then came the threat to Vavuniya, the island's northern garrison town and the headquarters of the Army's Wanni operations. Through announcements, the Tigers asked the civilians to leave the town in view of an impending attack.

Although this was dismissed by the Government as part of the "psychological operations" of the Tigers, civilians started leaving the town. By November 12, practically the entire town had emptied itself, with only those who could not afford to travel or those who did not have identity passes to move out staying behind. A few days later, the Tigers said that the civilians could return but asked them to stay away from areas situated near the Army camps (see separate story).

LIFE in the south, however, was largely unaffected by the northern casualties. Colombo continued in its normal self. There was a clear distancing from the battlefield, not only in geographical terms but also in mental terms. But for political leaders, academicians, peace activists and activists of non-governmental organisations involved in relief operations, the northern casualties largely seemed to involve "somebody else's war". But a similar situation existed during last year's Kilinochchi defeat.

One interpretation is that this also has "positive" implications in that there is a fundamental "no backlash on the minorities". This, analysts observed, was in stark contrast to the 1983 situation when the killing of 13 soldiers sparked anti-Tamil riots throughout the island.

Sunil Bastian of the International Centre of Ethnic Studies, Colombo, attributes the larger "ambivalence" of the country's population to war as a reason. "People just want to get on with their lives," he said.

Making the point that extreme Sinhala opinion is now divided, Bastian also observed that any "instability in the south as the consequence of an event in the north is always organised". As in the past, some "sections in the parties that held power were behind it." The present southern reaction to the northern debacle, he said, made it "quite clear that now those groups do not exist in the main parties. There is no space for hardliners in these parties."

Moreover, incidents directly involving the southern people, such as those related to the insurrections by the Janatha Vimukthi Peramuna (JVP) during the 1980s and early 1990s, had a more direct bearing on the people in the south.

The most telling implication of the Tiger offensive, however, would be on the living conditions of Wanni residents. The displacement of the people, providing food and other essentials to them, and averting chaos will have to engage the attention of the Government, non-governmental organisations (NGOs) and

asked their distributors to obtain the permission of the Competent Authority. The censor, however, maintained that clearance would be given if the Customs sought clarifications on specific reports. The matter, however, was sorted out when the Ministry in charge of the media wrote to the Customs asking it to release the publications.

For the residents of northern Jaffna, the areas held by the LTTE, as well as places close to the rebel-held areas, the clandestine radio station of the Tigers, Voice of Tigers (VoT), is a key source of information. Taking the propaganda offensive into the government's turf, the LTTE last year commenced services in Sinhala, aimed apparently at "demoralising the security forces". Of late, according to displaced residents in the north, the LTTE's broadcasts are electronically jammed.

Curbing war-related news is but a manifestation of the thinking that column-centimetres and sound bytes can defeat into victory. However, a disturbing result of keeping the northern conflict zone and the rebel-held areas out of bounds for the media as well as independent non-governmental organisations has been a consistent deterioration of the living conditions and the people's thinking in those regions. An underlying, perhaps unintended, consequence has been the furthering of the 'us' and 'them' syndrome in an already ethnically divided country.

Militarisation of Madhu

V.S. SAMBANDAN

REVERED by people of all religious faiths, the Roman Catholic Madhu church, in the battle zone, has been a nest of peace through the island's bloodiest conflicts. The Dutch-period shrine was shelled on November 21, leaving 38 civilians dead. The Sacred Heart chapel and a section of the main shrine were damaged.

During periods of turmoil, the shrine and its precincts, an enclave of tranquillity, have offered refuge to thousands of displaced persons, almost entirely Tamil. Priests had persuaded both the Sri Lankan Army and the Liberation Tigers of Tamil Eelam (LTTE) not to take their battle to the pilgrimage centre. The situation, however, changed gradually since March.

Once the Sri Lankan security forces gained control over the shrine, the LTTE left the area. A minimal presence of government commandos was maintained there. The priests protested against the militarisation of the pilgrimage centre. The Government took over Madhu in March just ahead of the Provincial Council elections in the south and interpreted this as a "military gain". The town was soon given power supply. Simultaneously, thousands of refugees who had lived there for years were evacuated and "rehabilitated" either in their villages or in government-held areas.

In mid-November, the shrine was back in focus. As the LTTE moved westwards with its Operation Unceasing Waves III, some 3,500 persons from Mannar district moved into the church as refugees. The Tigers had earlier taken towns and villages to the north, and civilians had flocked to Madhu. The Tigers followed suit. On November 18, government troops left the shrine and the Tigers gained control over the church and its precincts. Two days later, government troops "regained control over Madhu".

According to the priests, "the Army came in with its armoured cars into the pilgrimage centre". The peace of the church was shattered by artillery fire the same night. The Lankan Defence Ministry, which had maintained silence on the loss of Madhu, blamed the LTTE: it said that "after the security forces consolidated the area," the LTTE "launched a heavy-artillery-and-mortar attack indiscriminately on the Madhu church premises." Church authorities said that 13 of those killed were children. At least 56 people, including 25 children were injured.

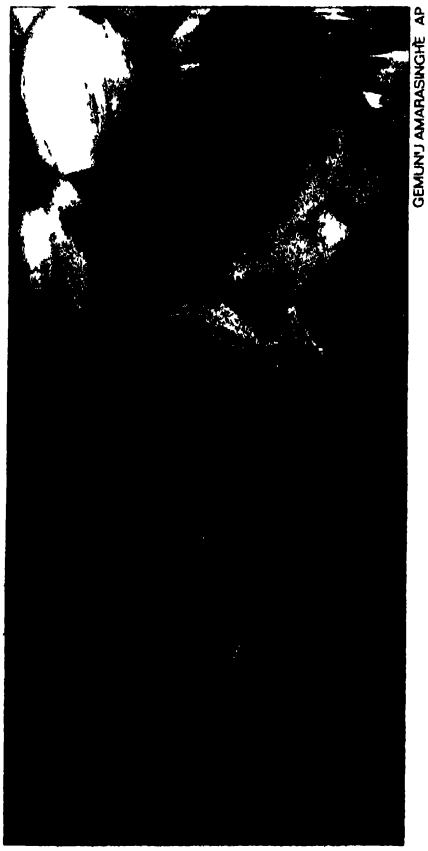
Rev. Dr. Rayappu Joseph, the Bishop of Mannar and the secretary of the Catholic Bishops' Conference of Sri Lanka, said: "Such a desecration has never happened of in the church's 450-year history." Church leaders appealed to "both the state forces and the LTTE to immediately withdraw from the sacred area of the shrine of Madhu... to strictly refrain from using Madhu for any strategic or political advantage... and leave Madhu completely free for the pilgrims to visit the shrine without any restriction for their spiritual purposes."

international organisations. Some former Tamil militant groups, such as the People's Liberation Organisation of Tamil Eelam (PLOTE) and the Tamil Eelam Liberation Organisation (TELO), have started supplementing the relief efforts of the Government and aid agencies. "We are organising blood donation camps and providing other relief materials for the displaced," said Sudhan, a TELO area leader.

If Operation Unceasing Waves III brought more territory to the Tigers, it remains to be seen how they will be able to spread further. Military officials, putting the larger picture in perspective, feel that if the Tigers spread their terrain too far, they would be faced with the same constraints as the Army faced – too much land and too little people to man it.

While recent northern military campaigns have clearly redrawn government- and rebel-held territories, they have also sent across the signal that more than military gains and losses it is in addressing the separatist conflict from the political perspective that would result in the cessation of hostilities. Until then, unfortunately, the wounds of the war will fester.

V.S. SAMBANDAN



"The military don't start wars Politicians start wars"

– William Westmoreland

SRI LANKA is at a crucial political juncture An estimated 11.8 million voters approach the presidential election scheduled for December 21. The two main contestants are President Chandrika Kumaratunga and Opposition leader Ranil Wickremasinghe.

Given the country's sensitive voting structure, the minority vote will determine the outcome Support for the two main contestants, fielded by the ruling People's Alliance (P.A.) and the Opposition United National Party (UNP), is evenly balanced.

In the 1994 elections, Chandrika Kumaratunga, contesting on a promise of bringing peace to the northern area, won a landslide victory with the support of the Tamil vote This time around, she is determined that there will be no cessation of hostilities until the Liberation Tigers of

GEMUNU AMARASINGHE AP

President Chandrika Kumaratunga at the election commissioner's office to file her nomination papers.

A close race

Tamil voters may hold the key in the December 21 presidential elections in Sri Lanka. But how many will actually vote?

Tamil Eelam (LTTE) is militarily weakened and brought to the negotiating table on the government's terms.

The ruling formation is further handicapped by the current military setbacks in the Wanni region.

Wickremasinghe, who had remained silent on the Government's peace package for the last four years, approaches the elections with a "pact with the people" agenda, which includes, among other things, talks with the Tigers and a promise of "rehabilitating the militant cadres" after finding a solution to the conflict.

While Chandrika Kumaratunga presents the "peace package" that she was unable to push through in Parliament owing to the absence of a two-thirds majority, Wickremasinghe pins his hopes on the "pact".

For his part, V. Prabakaran, the LTTE supremo, has placed the militarisation issue clearly on the agenda by launching the third phase of Operation Oyatha Alaigal soon after the election dates were announced. Scoring victory after victory in the eastern parts of the Wanni, the LTTE moved to the western flank, thereby maintaining pressure on the Government, and consequently, on the southern polity.

The LTTE offensive also ties up the resolution of the ethnic conflict with military action and comes as a challenge to the island's liberal-thinking peace constituency.

Perhaps the most interesting aspect of the electioneering will be the manner in which the majority vote will be sought. The Tamil voters, for all practical purposes, have distanced themselves from Chandrika, who was elected last time on the promise of bringing about an "honourable peace". The experience of the past four years has, however, made it impossible for even moderate Tamil politicians to tell voters to back her this time. "We do not have anything to show the Tamils that concrete gains have been made," a Tamil politician said. Another said that he was likely to be dismissed by the Tamil electorate if he sought their vote for the President.

Wickremasinghe's position is no better. Even those Tamil voters who are opposed to the candidature of Chandrika Kumaratunga are reluctant to espouse the cause of the UNP. Anxious to distance themselves from the mainstream parties, overall a large section of the Tamils seem to show a lack of interest in the elections.

"It is an election with which we are not concerned," said a voter in Vavuniya. Echoing similar sentiments, some residents of Jaffna said that it was practically "a southern election". One voter said: "With the Army present all over this place, the thought of an election is secondary to our interests."

The eastern Batticaloa district overwhelmingly voted for Chandrika Kumaratunga last time. This time the situation has changed. "We gave her the largest number of votes, but we are disappointed," a Tamil leader from the area said.

UNP leader Ranil Wickremasinghe, after filing his nomination papers on November 18.

This sets the stage for the ruling coalition to succumb to pressures from majoritarian sentiments. The recent crossing over of some known Sinhala hardliners from the UNP – Nanda Mathews, Wijepala Mendis and Susil Moonasinghe – points to this possibility. Significantly, Moonasinghe stated in clear terms after his cross-over that he was opposed to the peace package which alters the unitary status of the Constitution. He added that he was, prior to his defection, proposed by the island's Buddhist clergy as a presidential candidate.

The continued impasse on the conflict-resolution front, and the military actions in the north, could also mean a reduction in the number of Tamils who will cast their votes. With the LTTE capturing more territory, there is a possibility of the elections turning out to be predominantly southern (read Sinhalese) affair.

With 13 candidates in the fray, the largest number in any presidential election in the country, the coming weeks promise to throw up a cacophony of voices. The Janatha Vimukthi Peramuna (JVP) has fielded a politburo member, Nandana Gunathilaka, who espouses a single-point agenda of the abolition of the Executive Presidency. During the previous election, the JVP had withdrawn its candidate in favour of Chandrika Kumaratunga as she had promised to do away with the Executive Presidency. Given the nature of its Left-wing constituency, the JVP could eat into the votes of the P.A. This is an added disadvantage for the P.A., as already the incumbency factor is working against it. The UNP, on the other hand, is yet to be seen as a party which could provide an alternative.

Vasudeva Nanayakkara of the Left and Democratic Alliance has the backing of non-governmental organisations. He hopes that the Tamil vote would come his way. He has promised to stop the war and end the difficulties faced by Tamils.

Other contestants include Harishchandra Wijayatunga of the Sinhalaye Mahasammathe Bhoomiputra Pakshya, who is for a "Sinhala-Buddhist state"; Rajiva Wijesinha, an academician belonging to the Liberal Party; and Tennyson Edirisurya, who has declared his opposition to the Executive Presidency. Edirisurya has called upon the voters to invalidate their votes and has promised to do so himself. ■

Exit Kalyan Singh

Kalyan Singh makes way for Ram Prakash Gupta as Uttar Pradesh Chief Minister, but the prognosis for the Bharatiya Janata Party is far from positive.

VENKITESH RAMAKRISHNAN
in Lucknow

"THE political roller-coaster has completed one cycle, but this is by no means a halt. It is bound to move again, and next time, who knows, the results may be vastly different." That was Samajwadi Party general secretary Amar Singh's response to the developments in the Uttar Pradesh unit of the Bharatiya Janata Party, which culminated in Kalyan Singh's replacement as Chief Minister. The statement of Ram Prakash Gupta, the new Chief Minister, that he was "wearing a crown of thorns" could turn out to be truer than he meant it to be, added Amar Singh.

This assessment may have come from a leader of the BJP's principal political adversary in the State, but it has many takers within the BJP. The mood among a large number of legislators on October 12, when the Ram Prakash Gupta Ministry was sworn in, and on October 17, when it was expanded, illustrated this. There were many glum and angry faces at an event that was billed as the beginning of a process meant to lift the party's sagging fortunes.

It is not merely the supporters of Kalyan Singh who are upset and who predict the return of chaos to the State BJP. Even leaders belonging to upper-caste groups, led by Ministers Kalraj Mishra and Lalji Tandon, who had campaigned for Kalyan Singh's removal for nearly six months, were not really savouring what should have been their moment of victory.

For, although Kalyan Singh was replaced, the leaders had failed to realise their personal objectives. Both Mishra and Tandon had aspired to become Chief Minister; in fact, days before Kalyan Singh was removed, Mishra's supporters and a section of the media were certain that Mishra would be appointed. Even on November 9, when the central leadership of the party foisted Ram Prakash Gupta on the State unit, Mishra's supporters had not given up hopes.

Rajnath Singh, president of the State unit of the party, too had projected himself as a candidate, but his disappointment was relatively minor for two reasons. One, he managed to retain his party post, despite indications that along with the replacement of the Chief Minister, there would be changes in the party organisation. Second, sensing early on that none of the three chief ministerial candidates stood a good chance, he backed Gupta's candidature when the central leadership first suggested it. This tactical move strengthened his relationship with Gupta.

Other factors could add to Rajnath Singh's primacy in the State unit. Gupta has been out of active politics for long and might find it difficult to come to terms with the prevailing political equations, which are based on caste and pressure groups. Gupta is not lacking in administrative experience – he was Deputy Chief Minister in 1967 under Charan Singh – but the

SUBIR ROY

Chief Minister Ram Prakash Gupta with (from right) outgoing Chief Minister Kalyan Singh, president of the Uttar Pradesh unit of the BJP Rajnath Singh and BJP president Kushabhau Thakre in Lucknow.

SUBIR ROY

BJP leaders Lalji Tandon and (right) Kalraj Mishra, who were contenders for the chief ministership.

political and bureaucratic structures of those times were not as caste-oriented as they are today. This is bound to increase Gupta's dependence on Rajnath Singh.

Mishra and Tandon, on the other hand, have other problems. In addition to the disappointment of losing the race, they find that their supporters are resentful at having been kept out of the Ministry. Among the aspirants for ministerial berths were two former Ministers whom Kalyan Singh had dropped – Ravindra Shukla, dropped following the controversy over the directive to make the recitation of "Vande Mataram" and "Saraswati Vandana" compulsory in schools, and Devendra Singh Bhole, for criticising the then Chief Minister's style of functioning. Dr. Surjit Singh Dang, the only Sikh MLA, and Rajesh Pandey, a senior Member of the Legislative Council, too had hoped to become Ministers.

In the end, Gupta inducted only two new Ministers of State, Seema Rizvi and Ram Babu Harit. Both these appointments were made with an eye on two key political constituencies – Muslims and the Scheduled Castes. Further, Dhanraj Yadav, a Minister of State under Kalyan Singh, was elevated to Cabinet rank. This too was done with caste equations in mind.

The disappointment in the anti-Kalyan Singh camp was accentuated by the fact that Gupta did not drop Ministers who were considered close to the deposed Chief Minister. Many key activists in the campaign to have Kalyan Singh replaced had hoped to fill the ministerial positions vacated by Kalyan Singh's associates. Their hopes soared on November 12 when only seven BJP Ministers were sworn in, although the "quotas" of alliance partners such as the Uttar Pradesh Loktantrik Congress (UPLC), the Janatantrik Bahujan Samaj Party (JBSP) and the Samata Party were filled up. This was seen as an indication of Gupta's intention to ease out Ministers close to Kalyan Singh, principally Hukum Singh, Premalata Katiyar and Surya Pratap Shahi.

However, on November 17, when the Ministry was expanded, all of them were sworn in. A section of the anti-Kalyan Singh group interprets this as a move to isolate Kalyan Singh from his own supporters.

One thing is certain: the change of leadership has engendered bitterness not only among the deposed Chief Minister and his supporters but also among those who claim to have overthrown him. This bitterness is not a good sign for the BJP and its new government.

THE initial signals from the dispensation hold no promise that the leadership change will bring any good to the State. When the campaign to have Kalyan Singh replaced was on, it was often claimed on behalf of the BJP that one of the factors that impeded good governance was the size of the 90-strong Ministry. The suggestion was that once Kalyan Singh was removed, the Ministry would be downsized. According to some central leaders, this issue came up when the proposal to remove Kalyan Singh was considered. It was raised with alliance partners too, and a few leaders of the UPLC and the JBSP reportedly agreed to consider the proposal. However, Gupta's Ministry is 91-strong: all the Ministers belonging to the alliance partners have been reinducted, and additionally two BJP leaders have been taken in. Evidently, the compulsions of keeping the coalition afloat take precedence over other promises.

The new Chief Minister's response to some of the controversial appointments made by Kalyan Singh during his last days in office, including the appointment of Lucknow Municipal Council member Kusum Rai as chairperson of the State Women's Commission, points to an inclination to take the path of least resistance. At least half a dozen others were similarly rewarded with chairmanships of corporations: Raj Narayan Bhind (Mandi Parishad), O.P. Singh (Seed Corporation), Dr. Anupam Alok (Forest Corporation) and Vinod Singh (Sugar Corporation). Kalyan Singh also transferred about 200 senior bureaucrats and police officers during his last 10 days in power.

Gupta is unlikely to reverse these measures; the beneficiaries of Kalyan Singh's largesse are thus likely to continue in their positions.

WHAT, then, do the BJP and the State stand to gain from Kalyan Singh's removal? It appears that the only tangible difference now is that Prime Minister Atal Behari Vajpayee, who was bent on removing Kalyan Singh from office, is pleased. So keen was he to attain this objective that he found time to discuss it with party colleagues even as the nation was coming to terms with the cyclone devastation in Orissa. Home Minister L.K. Advani and his supporters wished to see Kalyan Singh continue as Chief Minister, and BJP president Kushabhau Thakre was sympathetic to this line. But Vajpayee had his way.

On November 3 and 4, the BJP National Executive met in New Delhi to discuss Uttar Pradesh. Here, Vajpayee insisted that he would settle for nothing short of Kalyan Singh's removal. Murli Manohar Joshi backed Vajpayee. He put forward an old proposal – that Kalyan Singh, who belongs to a backward class, be replaced by a person from a forward caste. The allegation that Kalyan Singh had sabotaged the BJP's chances in the Lok Sabha elections in Uttar Pradesh in concert with Samajwadi Party president Mulayam Singh Yadav, who too belongs to a backward class, was repeated. Thakre then said that the leadership was thinking of taking "corrective measures" in Uttar Pradesh.

Thakre made a set of suggestions to enable Kalyan Singh to make an honourable exit but Kalyan Singh rejected all

'Caution will be my watchword'

Ram Prakash Gupta was as surprised as the rest of the political class in Uttar Pradesh when he was chosen as Kalyan Singh's successor. Known for his austere ways, 76-year-old Ram Prakash Gupta's qualification for the top job was that he was not part of any group in the State unit of the BJP and was acceptable to all groups. **Venkitesh Ramakrishnan** met the Chief Minister at his official residence in Lucknow to find out about his priorities and how he proposed to pursue them. Excerpts from the interview:

▶ *You have taken over as Chief Minister at a time when the BJP faces internal dissension. Also, there are complaints about misrule by the earlier regime. What are your priorities now?*

My primary objective is to improve the understanding between the party and the government. In this, I am getting support from all sections, including the MLAs of the ruling coalition, the workers of our party and the people in general. I myself am a representative of the high command and that ensures the cooperation of the central leadership. Because of these factors, I am certain that my job will be relatively easy and that I will be able to accomplish the party's objectives.

▶ *During the Kalyan Singh regime, sections of the State and central leaderships identified three major problems – lack of coordination between the government and the party; tussles between various factions led by prominent leaders; and divisions on caste lines in the State leadership, which had manifested themselves during the Lok Sabha elections. What specific steps would you take to address these issues?*

SUBIR ROY

These are not permanent problems that cannot be solved. These can be overcome with some care by the leadership, including the Chief Minister. But problems such as these should not be seen as the creation of a single person. Nor is finding a solution to them the responsibility of one person. And, if the government and the party function in such a manner as to bring welfare and justice to the people without bias or favour, these problems would disappear automatically.

▶ *There is a perception that you are a stopgap Chief Minister with a specific brief – to run a feel-good government that would create the right ambience for mid-term elections. It is also said that because of your long absence from active politics, you have difficulty in understanding and adapting to contemporary political practice.*

Elections are not in my mind. Nor are they part of my brief. As far as I am concerned, elections are far way. My task is to provide good governance and I want to strive towards this end with the help of my MLAs and the bureaucracy. With regard to my ability to adapt to the new political situation, I have full knowledge of the situation, its challenges and nuances. I am also aware that there is no use talking about the past. But I am sure that I can learn what is to be learnt, by taking a realistic approach, realising my

'A judicious selection'

Political observers consider **Rajnath Singh**, president of the Bharatiya Janata Party's (BJP) Uttar Pradesh unit, the real winner in the latest power struggles in the party. Although his ambition to become Chief Minister did not materialise, the general perception is that it was his manoeuvres that thwarted other contenders to the post, such as Kalraj Mishra. The central leadership's announcement that there is no move to replace Rajnath Singh as party president has also strengthened his hands. In this interview to **Venkitesh Ramakrishnan**, Rajnath Singh gives an assessment of the situation in the State BJP and the government. Excerpts:

▶ *What will be the impact of the change of leadership on the government and the*

I do not think that the change of leadership in government and related initiatives have been made on account of any crisis in the State BJP. Every party and organisation makes changes in its organisational and administrative setups to improve its functioning. This is what has happened here.

▶ *But a group of legislators had been running a campaign against Kalyan Singh for many months. Kalyan Singh also criti-*

Allegations and counter-allegations are natural in politics. But the point to note is that the BJP has never pursued its politics on the basis of caste, creed or class. It always strove to take all classes and castes on the basis of its socio-political philosophy. Sections of the party had deviated, although slightly, from this basic understanding. Some of them had involved in verbal duels too. All this had created an abnormal situation in the party. But it will be an exaggeration to brand it a crisis. All that our central leadership did was to take corrective steps to make the situation in the party normal. And this was done in a very smooth manner.

▶ *How far did the record of the Kalyan Singh government lead to the development of the abnormal situation cited by you?*

The Kalyan Singh government took a host of steps that were beneficial to the State and its people. But as in the case of every government, there could have been some mistake or the other. The central leadership took that also into consideration while taking corrective

▶ *The central leadership has selected Ram Prakash Gupta, who has been out of active politics for nearly a decade, as a compromise candidate.*

strengths and weaknesses as they are. My effort will be to make my actions speak louder than words. That, I hope, will put an end to all this talk about my inability to adapt to the political situation.

▶ *You said that providing justice and welfare to the people would be your primary concern. Does it imply that the Kalyan Singh regime was not able to do this?*

I do not say that. My predecessors have done so much. But nobody is perfect. There could have been decisions and programmess that upset people. I will look into all these.

▶ *Some decisions taken by Kalyan Singh during the last days of his government, particularly the one on the appointment of his friends and close associates to sinecures, have generated controversy. Will you review these decisions?*

There is no need to review all decisions. But if there are specific charges, I shall look into them.

▶ *A section within the BJP is opposed to the reforms initiated by Kalyan Singh in the financial and power sectors and in local administration...*

I shall look into such specific questions. There is a perception that some of these plans were pushed ahead in a hasty manner. So, caution will be my watchword.

▶ *Could this review lead to a rollback of some of these steps?*

It could. If a rollback is in the interests of the people, we will do that. I want to assert that these measures should not be seen as steps against a person or a group. I would like decisions on these matters to be unanimous. Hence, I shall ensure wide-ranging consultations on these matters.

▶ *There is a perception that Kalyan Singh is being isolated by both your government and the party. The exclusion of his supporters from the Cabinet is cited as a case in point.*

This is all media speculation. You will see all of us working together harmoniously.

▶ *There is the feeling that the intervention of the Rashtriya Swayamsevak Sangh (RSS) in government will increase, since you are more committed to the RSS than Kalyan Singh is.*

There will be no need for the RSS to intervene. All its intervention will be done through me, because I am the seniormost RSS worker in Uttar Pradesh. There could be more important RSS leaders in the State, but there is unanimous opinion about my being the living example of the RSS way of life, values and ideals. So I am there to take care of the RSS interests and there is no need for intervention.

▶ *But many of the BJP's allies, such as the Uttar Pradesh Loktantrik Congress (UPLC) and the Janatantrik Bahujan Samaj Party (JBSP), do not accept the Hindutva philosophy of the RSS.*

I would like to affirm that none of the RSS' ideals is against the people. The RSS is pro-poor and wants to remove corruption from society. The RSS has idealism unmatched by any other organisation. If I may add, the Hindutva philosophy was manifest in a striking manner in Mahatma Gandhi. If you realise the fact that Gandhi was the greatest Hindu of this century, then there is no difficulty in understanding Hindutva. The RSS has kept Gandhi as part of its "*pratha smarana*" (things and people to be remembered first in the morning) along with Rama and Krishna. People do not try to understand Hindutva in all its depth. They approach it superficially. To some people you are Hindu if you become anti-Muslim. I do not think these people are Hindus.

▶ *But it was the BJP and the Sangh Parivar that created this impression during the Ayodhya agitation.*

I would only like to say that the basic Hindu value of life is humanity. I believe that this is the value in Islam and Christianity too. My effort will be to underscore this and create a situation of harmony in Uttar Pradesh society. ■

It is not right to see Ram Prakash Gupta as a compromise candidate. He is one of the senior most leaders of the party in the State and has vast experience in government and in the organisation. He understands the various problems and the possibilities of the State well. In fact, the central leadership has made an extremely judicious selection. I congratulate them on this.

▶ *What are your priorities now as the president of the BJP's State unit?*

I shall strive to make the party stronger under the leadership and guidance of Ram Prakash Guptaji. The difference of the party from other political parties has to be highlighted properly. The fact that the party leadership is one with the masses in sharing their miseries and happiness would be emphasised again through our actions.

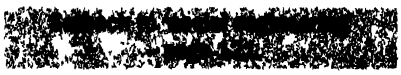
▶ *Kalyan Singh has said that the BJP suffered electoral reverses in Uttar Pradesh mainly because it abandoned issues such as the Ram temple, Article 370 and a Uniform Civil Code.*

The central leadership has gone into all these questions and will study the opinion expressed by Kalyan Singhji. Only after a comprehensive assessment can one give a response on this.

▶ *You had offered to resign as party president owning moral responsibility for the electoral reverses. The central leadership accepted similar offer from Kalyan Singh but has rejected yours. What do you think is the reason for the difference in the responses?*

I had taken up the moral responsibility and offered to resign. But I am also a disciplined soldier of the party. Hence I have to abide by the decision of the leadership, whatever it is. If the central leadership thinks that I have to continue to look after the organisational affairs of the party, I cannot disobey it and insist on my resignation. ■

these proposals in the belief that with the backing of Advani and others such as party general secretary K.N. Govindacharya, he would continue in office. Advani and Co. supported Kalyan Singh on the basis of the argument that Other Backward Classes such as Kurmis and Lodh Rajputs were the mainstay of the BJP in the State and that large sections of people belonging to these caste groups owed their allegiance to Kalyan Singh. At the end of the National Executive meeting, Kalyan Singh exuded confidence; returning to Lucknow, he asserted that there was no move to remove him.



But in the next four days, reality caught up with him. The central leadership announced that Gupta would be appointed in his place. A shaken Kalyan Singh went on the offensive: he made a trip to the makeshift temple at the site of the demolished Babri Masjid at Ayodhya and accused the Prime Minister of not giving adequate attention to the BJP's basic campaign themes. He followed this up with the appointment of his supporters in key posts. For the next few days, he kept the central leadership on tenterhooks on the matter of

precisely when he would submit his resignation. Finally, he handed over his resignation letter to Governor Suraj Bhan on the morning of November 11, barely a few hours before Gupta was to be elected leader of the BJP Legislature Party.

IN the final analysis, even the choice of Gupta is an indication that the central leadership acknowledges Kalyan Singh's clout. That none of Kalyan Singh's detractors such as Mishra, Tandon and Rajnath Singh was chosen reflects the inability or reluctance of the leadership to go all out against Kalyan Singh. The same applies to the retention of Kalyan Singh's supporters in the Ministry. In fact, at a meeting of the State leadership of the party on November 11 and 12, Mishra, Tandon and Rajnath Singh had pressed for the removal of some of Kalyan Singh's close supporters from the Ministry and Gupta reportedly agreed to do so. However, this plan was torpedoed by some nifty counter-moves by Govindacharya and Advani. Govindacharya rushed to Delhi to inform Advani of the move; Advani said he would not attend the swearing-in if Kalyan Singh's supporters were dropped. He made it clear that the State leaders should wait for Vajpayee, who was abroad, to return and take a final decision. After Vajpayee returned, Advani held talks with him; by all indications, this led to the retention of all of Kalyan Singh supporters in the Ministry.

Given the fact that Kalyan Singh has his own people in the Ministry and in the BJP Legislature Party, he will continue to be a force in the State BJP. He also has a good rapport with a large number of MLAs of the UPLC and the JBSP. However, the section of the BJP that has the support of Tandon and Mishra reportedly plans to initiate moves to focus attention on allegations that he was working in tandem with the S.P. during the Lok Sabha elections; its intention is to force the former Chief Minister to take extreme steps and get him expelled from the party. This section apparently has a new plan to build up the BJP in the State (see separate story).

One thing, however, is certain. Despite his being a "compromise candidate", Gupta will find the going tough. And as BJP insiders admit, Gupta's elevation has not ended the fireworks in the party. In fact, the post-Diwali change of leadership has merely given a new dimension to political pyrotechnics in the Uttar Pradesh BJP. ■

POLITICS

Tussles ahead

Out of power, Kalyan Singh has the potential to cause immense damage to the BJP, and although the central leadership is wary of displeasing him, hardliners in the State unit want to raise the stakes.

VENKITESH RAMAKRISHNAN

LEADERS who campaigned for the removal of Kalyan Singh as Chief Minister cited three reasons for the demand. They claimed, first, that the Bharatiya Janata Party's traditional support among the upper castes was eroding owing to the Kalyan Singh Government's policy of appeasing backward classes. Second, they claimed, Kalyan Singh's style of governance – characterised by an excessive dependence on bureaucrats and undue interference by his family members and friends – had led to a situation where grass-roots-level leaders and activists felt alienated. Third, the leaders said, Kalyan Singh had made no effort to build a cohesive working relationship between the party organisation and the administration, and that the BJP organisational machinery had no role in governance.

Now that Kalyan Singh has been replaced with Ram Prakash Gupta, will the BJP be able to rectify these "problems"? BJP leaders are less than optimistic. Moreover, large sections of the party at the State and central levels fear that the erosion of the BJP's support among upper-caste groups, which are increasingly turning to the Congress(I), may be unchecked.

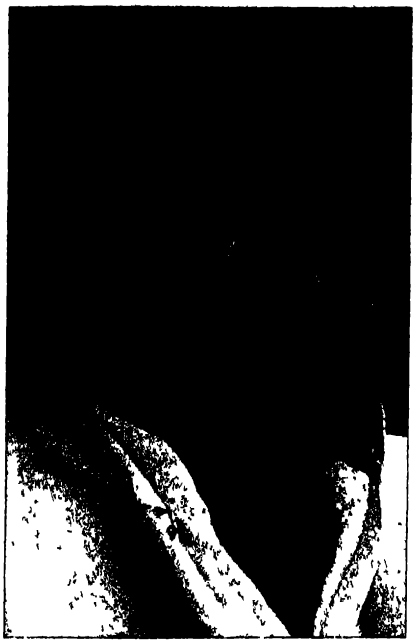
The BJP reckons that it lost a dozen seats in Uttar Pradesh in the recent parliamentary elections on account of the shift in the votes of the upper castes, especially Brahmins, to the Congress(I). Several central leaders, including Atal Behari Vajpayee and Murli Manohar Joshi, and their supporters in Uttar Pradesh had emphasised this point to reinforce their demand for Kalyan Singh's removal and the appointment in his place of a leader who would be acceptable to upper-caste groups.

However, Home Minister L.K. Advani and his confidant and party general secretary K.N. Govindacharya pointed out that the party had lost an equal number of seats owing to an erosion in its support base among the backward class-

SUBIR ROY

On a visit to Ayodhya on November 9, two days before he resigned as Chief Minister, Kalyan Singh with sants and mahants associated with the movement for the construction of a Ram temple at the site of the demolished Babri Masjid.

es. They did not want any immediate action taken against Kalyan Singh.



Obviously, the Vajpayee-Joshi combine's viewpoint prevailed: Kalyan Singh was eventually removed. However, the leadership and the rank and file are not sure whether the party can win back the support of upper-caste voters.

According to a senior Minister in the State, if the central leadership had wanted to win back the support of the upper-caste groups, it should have appointed a Brahmin or a Thakur Chief Minister, not a leader belonging to the Vaish (Bania) community. (Banias, who constitute an intermediate caste, account for less than 2 per cent of the State's population; Brahmins account for about 9 per cent and Thakurs 8 per cent.)

The Minister (who is a Brahmin) told *Frontline* that the central leadership should have acted "boldly" and appointed either Kalraj Mishra, a Brahmin, or Rajnath Singh, a Thakur. "Now," he said, "the BJP might end up losing the support of both the upper castes as well as the backward castes whose votes Kalyan Singh used to bring in." Kalyan Singh belongs to the Lodh Rajput community, which accounts for about 6 per cent of the population; he also has significant support among the Kurmi community, which accounts for around 7 per cent.

These caste equations could get further complicated if Kalyan Singh decides to rock the boat. He has two options: join hands with Samajwadi Party (S.P.) president Mulayam Singh Yadav and form of a broad coalition to represent the backward classes, or implement his pledge to renew the movement for the construction of a Ram temple at Ayodhya. If he chooses to team up with Mulayam Singh, it could lead to a direct political battle between the upper castes and the backward classes, and the demographic advantage will be with the backward classes. The S.P. already has a support base among Muslims; the consolidation of the backward class vote would make a new coalition a major force. Mulayam Singh, on his part, has sent feelers to Kalyan Singh: he said that Kalyan Singh's removal was an affront to the backward classes. He called for an agitation to press for 54 per cent reservation for the backward classes.

If Kalyan Singh chooses to raise the Ram temple issue, it would reflect an attempt to exploit, once again, his twin strengths: of being a backward class leader and of being a mascot of the Ayodhya agitation. It was on the basis of these strengths that he became Chief Minister in 1991. Following the demolition of the Babri Masjid and the dismissal of his government, he came to be seen as a leader who sacrificed power for a greater cause.

R V MOORTHY

Samajwadi Party president Mulayam Singh Yadav.

Owing to considerations of realpolitik arising from the BJP's pursuit of coalition politics at the national level since 1998, the Ram temple issue receded into the background. In the changed circumstances, Kalyan Singh was perceived more and more within the BJP as a leader of the backward classes who would not be able to retain upper-caste support, the BJP's main base. It was this consideration that ultimately led to his removal.

It is doubtful whether his promise to renew the temple agitation will help him politically, but the message is clear. He can embarrass the central leadership, particularly Vajpayee – who he says put the temple agenda on the backburner. Sensing a chance to return to the limelight, the sants and mahants of Ayodhya who are associated with the Vishwa Hindu Parishad (VHP) welcomed Kalyan Singh's announcement. Evidently, Kalyan Singh proved his potential to damage the BJP.

It is this factor that compelled the central leadership to appoint Gupta, rather than a leader who had campaigned actively for Kalyan Singh's removal, his successor. Having decided to remove him, the central leadership did not want to displease him too much.

But an overwhelming section in the State unit of the BJP thinks that such caution has not served the party's interests. While a compromise was the preferred choice for the central leaders, the perception within the party and outside is that a weak choice has been made in order to avert an open revolt by Kalyan Singh. Sections of the upper-caste group, particularly supporters of Kalraj Mishra, blame Advani and Govindacharya for this: according to them, the two leaders accused Mishra of running a media campaign to project himself as the Chief Minister and of vitiating the atmosphere to an extent where a smooth selection of a successor to Kalyan Singh became impossible.

There are suggestions within the BJP that Rajnath Singh also played a part in this operation: he was by then sure of retaining his position as president of the State party unit and did not want Mishra or Lalji Tandon to become Chief Minister. The choice of Gupta suits Rajnath Singh; it is unlikely that Gupta, a septuagenarian who is returning to active politics after a long gap, can become a power centre in his own right.

IN the midst of all these, supporters of Kalraj Mishra and Lalji Tandon have advanced a radical line: that the central leadership provoke Kalyan Singh into leaving the party. According to them, even if Kalyan Singh teams up with Mulayam Singh and consolidates the backward class vote, such a coalition can be countered by an alliance between the BJP and the Bahujan Samaj Party (BSP). Mishra and Tandon have good equations with BSP leader Mayawati.

Leaders close to Advani have opposed this proposal. According to them, such a course of action would trigger a shift in the support of Muslims from the BSP to the S.P., which would render a BJP-BSP combine weak. Just how the tussle will unfold is to be seen, but it is clear that the confusion within the BJP is far from resolved despite Kalyan Singh's removal.

Party leaders such as Rajnath Singh and Gupta hope that they will be able to show better results on the two other problems identified by those who campaigned for Kalyan Singh's removal. Gupta is known for his austerity and integrity, and there is no likelihood of any undue interference in the administration by his relatives and friends. And since Rajnath Singh and Gupta have a good rapport, there could be better understanding between the party organisation and the administration. How far the new Chief Minister, who has not held an administrative office for long, will depend on bureaucrats will be watched with interest. ■

A clutch of new bills

The NDA Government is set to push through in the winter session of Parliament several pieces of legislation, some of which have raised concern owing to a watered-down approach to financial wrongdoing and an anti-people tack.

SUDHA MAHALINGAM
in New Delhi

THE winter session of Parliament, scheduled to start on November 29, is likely to provide firm pointers about the Bharatiya Janata Party-led Government's intentions on the policy changes known as "second generation reforms". The increasingly assertive nature of the statements issued by official spokespersons suggests that the greater security of numbers that the Government enjoys in the Lok Sabha may encourage it to adopt an ambitious legislative agenda in the next few months.

In order to be able to do this, an element of concord will need to be fostered with sections of the Opposition, since the National Democratic Alliance, the ruling coalition, does not command a majority in the Rajya Sabha. Although the Congress(I) is ideologically committed to many of the legislative proposals that the BJP may introduce, there could be a tacit effort to premise its cooperation on the fulfilment of certain other (largely unstated) conditions. A further possibility – though at this moment that is a remote one – is a genuine change of heart within the Congress(I). Sections within the Congress Working Committee are known to be arguing the case for the party to assume the mantle of populist legitimacy that it has donned with great electoral success in the past. Too eager an advocacy of the economic reforms would be, in this perception, costly in political terms and corrosive of the party's identity as the principal Opposition party.

At the truncated first session of the 13th Lok Sabha, Union Finance Minister Yashwant Sinha introduced two bills with major ramifications: the Insurance Regulatory and Development Authority Bill and the Prevention of Money Laundering Bill (PMLB). Also introduced was a bill to amend the Securities Contracts (Regulation) Act of 1956. The Foreign Exchange Management Bill, which was to be replaced with the Foreign Exchange Regulation Act, could not be tabled owing to stiff resistance from the Opposition. This represents an anomalous situation, since the bills pertaining to foreign exchange management and money laundering were to constitute a composite piece of legislation.

The PMLB that was drafted though not introduced in 1998 was already a watered down version on account of pressure from various quarters. In the variant introduced in Parliament now there has been a further dilution, arising from the incorporation of the dubious recommendations of the parliamentary standing committee on finance. According to PMLB 1999, a person can be booked for money laundering only if it can be proved that he or she "knowingly" entered into a transaction involving proceeds of any of the crimes listed in the schedule to the Bill. The earlier Bill did not contain the word "knowingly". The Bill as it stands now requires the authorities first to prove a crime, ascertain that proceeds have been generated from the crime and finally establish that a person had "knowingly" entered into a transaction involving the proceeds.

In effect, the bill is redundant inasmuch as it requires that the accused be charged under any of the crimes listed in the schedule before the money laundering authority can take cognizance of transactions in any proceeds that may have arisen from such crimes. All that the bill now enables are additional penalties for money laundering after any of the other crimes listed in the schedule has been proved.

The greater security of numbers that the Government enjoys in the Lok Sabha may encourage it to adopt an ambitious legislative agenda in the next few

Two key concepts considered essential for the prosecution of acts of money-laundering have been omitted in the bill – "suspect property" and "deemed money laundering". The inclusion of these would have permitted the authorities to hold any unexplained property or money, whether to crimes listed in the schedule or not, as "suspect property", which would lay the person possessing or dealing in such property open to the charge of "deemed money laundering". These concepts were both included in earlier drafts, and pressures from various lobbies have compelled the government to delete them.

Even in its earlier incarnation, though, the PMLB did not incorporate major economic offences in its schedule, especially tax evasion that accounts for the largest chunk of black money in India. The 1999 version takes it a step further and has even left out the lone economic offence in the schedule, namely "falsification of accounts". Corporates indulging in falsification of accounts can now sleep easy. The deletion of this offence from the schedule was once again recommended by the parliamentary standing committee which heard representations from industry. PMLB 1999 proposes a stiffer penalty for vexatious search – imprisonment of up to two years or a fine of up to Rs. 50,000, or both.

PMLB 1999 requires not only financial institutions and intermediaries but banking companies to report transactions above a certain minimum amount to be notified. Although the parliamentary standing committee on finance had recommended that only cash transactions need be mandatorily reported, thankfully saner sense has prevailed.

The latest version also introduces a new chapter that deals with reciprocal arrangements with foreign countries for exchange of information for the prevention of the offence and assistance in transfer of accused persons. This is an improvement on the earlier draft.

The IRDA Bill 1999 seeks to establish a statutory authority to regulate, pro-

mote and ensure the orderly growth of the insurance industry and to amend the Insurance Act 1938, the Life Insurance Corporation Act 1956 and the General Insurance Business (Nationalisation) Act 1972. Section 2 of the Insurance Act 1938 is to be amended to include companies that have aggregate holdings of paid-up equity capital of up to 26 per cent by a foreign company either by itself or through its subsidiary companies or nominees. With this step, the insurance sector will be opened up to private and foreign investment. The entry of the private sector has been made possible through the amendment of "exclusive privilege" granted to the General Insurance Corporation in the GIC Act of 1956 and to the Life Insurance Corporation of India in the LIC Act of 1972.

Interestingly, the Bill stipulates that an Indian promoter dilute stake to 26 per cent in 10 years. The Bill proposes a minimum capital of Rs. 100 crores for life and general insurers and Rs. 200 crores for reinsurance firms. The Reserve Bank of India specifies that the funds of the policy-holders be retained within the country, but is silent on the repatriation of profits and dividend by the companies with foreign equity.

The Bill stipulates that life and general insurers must maintain solvency margins in the form of minimum assets in excess of liabilities. The solvency margin for insurers is fixed at Rs. 50 crores, while for reinsurers it is Rs. 100 crores.

The SCRA Bill envisages two new sections permitting derivatives trading and regulating plantations. An amendment to Section 29A to enable delegation of powers to the RBI is included. The 1969 Government of India notification that bans ready forward trading in government securities is to be repealed. This will empower the RBI to regulate ready forward transactions in specific securities. This, according to the Government, will help deepen and widen the debt market.

The tabling of the three bills in the last session was accompanied by a walkout by the parties of the Left and others. The Left parties, the Samajwadi Party and the Rashtriya Janata Dal have described the IRDA Bill as "anti-national". For the Government, though, ensuring the cooperation of the Congress(I) would be sufficient to secure the passage of the bills.

What that would in turn entail is a matter for speculation. The most likely possibility is that the Congress(I) would take the pragmatic decision to sustain the economic reforms that it still takes great pride in having launched, despite all the political costs it has since borne. ■

Cautious moves

The Congress(I) is set to take a series of steps on the basis of lessons learnt recently.

VENKITESH RAMAKRISHNAN

THE Congress(I)'s politics appears to have acquired a three-dimensional character following the first session of the 13th Lok Sabha. This was evident in the party's public pronouncements and also in inner-party manoeuvres.

Although the party is yet to assess fully the reasons for its debacle in the Lok Sabha elections, broadly, three factors have emerged, which point to the future course the leadership would take. The first is a move initiated by party president Sonia Gandhi to restructure the organisation on the basis of an assessment of the strengths and weaknesses that became evident in the election results. Secondly, there is a near-unanimous conviction that only the slogan of single-party rule would prove beneficial to the party. Several senior leaders feel that there is no need to alter the stand on coalition governments, despite the reverses suffered in pursuit of this agenda. The third is a readiness to play the role of a constructive Opposition in Parliament and outside.

While a revamp of the party organisation is expected to take place after a committee headed by Congress(I) Working Committee member A.K. Antony completes the assessments of the election results, the latter two factors have become evident in political manoeuvres. Sonia Gandhi is likely to constitute a few committees to look into aspects of organisational restructuring, as was done after the 1998 parliamentary elections. A new team of All India Congress(I) Committee general secretaries, mostly young leaders, is likely to be appointed in order to infuse dynamism into the party.

The decision to break with the Rashtriya Janata Dal and contest the coming Assembly elections in Bihar on its own indicates that the party is serious about the slogan of single-party rule. According to a CWC member, the dominating perception has been that the party should confine its alliances to regions where alliances have worked traditionally - Kerala and Tamil Nadu, for instance. In this context, there is an attempt to strengthen the party's bargaining position in Tamil Nadu *vis-a-vis* the Dravidian parties by winning over the Tamil Maanila Congress (TMC), which was formed by G.K. Moopanar and P. Chidambaram after they broke away in 1996. According to the CWC member, alliances that were struck in North Indian States such as Bihar and Uttar Pradesh, have generally weakened the State units. The leadership, he said, had decided that the Congress(I) should function independently in these States, whatever the consequences.

THE Congress(I)'s decision to play the "role of a constructive Opposition" and the government's not-too-rigid stand towards the main Opposition party became apparent during the Lok Sabha session. The performance of Sonia Gandhi and Home Minister L.K. Advani on the floor of the House during the debate on the motion of thanks to the President's address is a case in point. Both the leaders adopted a give-and-take policy.

In her maiden speech in Parliament on October 29, Sonia Gandhi went hammer and tongs against the National Democratic Alliance (NDA) government for Rajiv Gandhi being named in the Bofors case charge-sheet filed by the Central Bureau of Investigation (CBI). Mixing politics and emotion in good measure, she alleged that the "government's action is politically motivated" and that the Congress(I) "shall not tolerate the framing of an innocent man who is not in a position to defend himself".

Advani, who responded to her speech in the absence of Prime Minister Atal Behari Vajpayee, came out with a gesture that took everybody by surprise: he stated that he can "understand her sentiments and feelings on the issue" and promised that "the government is considering all aspects relating to the inclusion of Rajiv Gandhi's name in the Bofors charge-sheet... and the government will do whatever is appropriate."

Although Advani did not quite state that the Congress(I)'s demand to delete Rajiv Gandhi's name would be accepted,

there was an unmistakable hint of reconciliation. After Advani's speech, Sonia Gandhi added to the bonhomie by wishing Vajpayee speedy recovery from the illness that had kept him away from the House.

These developments were in direct contrast to the postures adopted by the NDA and the Congress(I) soon after the charge-sheet was filed. The two sides had differed on every aspect of the issue, including the procedure to be followed in Parliament when the issue was taken up for discussion. The Congress(I) saw "political vendetta" in the inclusion of Rajiv Gandhi's name, while the constituents of the NDA, led by the Bharatiya Janata Party, affirmed that the CBI had merely done its job. The CWC even alleged that the charge-sheet was filed with the "sole purpose of denigrating Rajiv Gandhi, and that this would not be tolerated by Congress(I) workers."

The Treasury benches were ready to initiate a full-fledged debate, but the Congress(I) opposed the idea, stating that Parliament had already spent 69 hours over the last 12 years discussing the Bofors issue. Evidently, the party was "averse to one more session of Rajiv-bashing". According to Madhavrao Scindia, the party's Deputy Leader in the Lok Sabha, the filing of the charge-sheet had not been preceded by the presentation of any evidence against Rajiv Gandhi. He said that the BJP was trying to score cheap political points.

For a full week the NDA and the Congress(I) continued in this acrimonious mode, until the exchanges between Sonia Gandhi and Advani changed the situation dramatically. It is learnt that the Prime Minister's Office (PMO) has sought the Law Ministry's views on the Congress(I)'s demand.

These developments created an impression that the Congress(I) and the BJP were working out a deal on the Bofors payoffs case. So intense is this impression that Sonia Gandhi, on her first tour of Amethi and Rae Bareli constituencies after the elections, was at pains to explain to the traditional supporters of the Nehru-Gandhi family that there was no such deal. "I am not going to bargain on this (Bofors) issue at all," she asserted.

There is also a line of thought that the Congress(I) has struck a deal with the government essentially on account of its failure to unite the rest of the Opposition on the issue. Its attempts to win over the Left parties and the 26-member-strong Samajwadi Party (S.P.) failed. However, the Left parties did focus on one aspect highlighted by the Congress(I). This related to the non-inclusion of the names of the three Hinduja brothers in the charge-sheet (they find mention only as co-conspirators), although investigations had suggested that they were also recipients of payoffs.

ANU PUSHKARNA

Congress(I) president Sonia Gandhi.

Apart from its failure to gain the support of other Opposition parties, the Congress(I) suffered embarrassment on account of the individual performances of leaders such as Mani Shankar Aiyar and party spokesperson Kapil Sibal. The former moved a notice under Rule 193 of the proceedings for a discussion on the issue, only to withdraw it subsequently, apparently under pressure. According to party insiders, Manishankar Aiyar and fellow Congress(I) members Jagmeet Singh Brar and Pawan Kumar Bansal, wanted an all-out attack to be launched against the government, even by stalling parliamentary proceedings. But senior leaders, such as Pranab Kumar Mukherjee and Madhavrao Scindia, prevented them from going ahead with the plan.

Kapil Sibal caused severe embarrassment when his argument that the names of dead persons should not find mention in criminal charge-sheets was dismissed by Information and Broadcasting Minister Arun Jaitley, who cited the charge-sheets in the Rajiv Gandhi and Indira Gandhi assassination cases. Kapil Sibal's *faux pas* took the steam out of the Congress(I)'s aggressive posture. As a result, the party virtually pleaded with the government to delete Rajiv Gandhi's name following the precedent set by the Janata Party government in 1977 in dropping Defence Minister George Fernandes' name from the Baroda dynamite case.

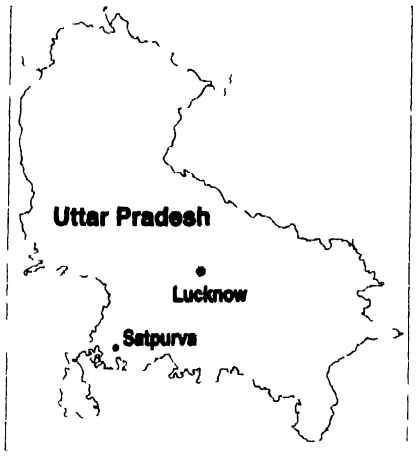
Referring to these failures in Parliament, Congress(I) leaders who had opposed Sonia Gandhi's choice as the Leader of the Opposition maintained that their objections had proved correct. One of them told *Frontline* in an almost triumphant tone that he had predicted that Sonia Gandhi would be unable to counter effectively contentious issues that involved her family, such as the Bofors case and a bill to bar citizens of foreign origin from holding high office.

This cynical attitude towards Sonia Gandhi's leadership capabilities may well have snowballed into a major inner-party problem had it not been for her October 29 performance. But, the most important question centres on the government's intent in adopting a reconciliatory posture, especially after pushing the Congress(I) to the ropes politically. On the face of it, the NDA would have gained by accentuating the Congress(I)'s discomfiture and highlighting this in public.

Informed sources say that a factor that compelled the government to change tack might be the need to complete the "second round of economic reforms" without any hitch. This process is said to have started with the Insurance Regulatory Authority Bill. This is one of the priority items on the Prime Minister's policy agenda. A two-thirds majority is required for the passage of such bills. The government has to depend on Congress(I) support for their passage in the Rajya Sabha too, as it is the dominant party in the Upper House. Ironically, the Congress(I) is the only party in the Opposition that is ideologically committed to the "reforms".

Apparently, the Congress(I) has taken advantage of this situation in order to minimise the damage caused by the Bofors issue. In fact, leaders such as Pranab Mukherjee had stated that the Congress(I) would not cooperate in the passage of important items of legislation if the government persisted with its arm-twisting tactics. Echoing this view, party spokesperson Ajit Jogi told *Frontline* that the Congress(I) would be forced to review its stand on several issues if the government sought to malign the memory of Rajiv Gandhi.

Apparently, these suggestions did play a part in the government taking a conciliatory approach. But, as Ajit Jogi points out, the Congress(I) perceives this merely as the first step and wants the government to take it to its logical conclusion. If the game proceeds along the lines set out by the Congress(I), the polity may witness more synchronised performances by the government and the main Opposition party. ■



An act of desperation

In a village in Uttar Pradesh, a widow ends her life on her husband's funeral pyre, raising disturbing questions about the status of women, particularly widows, in society.

V. VENKATESAN
in Satpurva
VENKITESH RAMAKRISHNAN
in Lucknow

THE road to Satpurva hamlet, 10 km from Charkari in Mahoba district in southern Uttar Pradesh, is unmotorable However, tyre tracks of vehicles that braved the dusty road point the way to the village of some 20 Dalit families, which seems virtually untouched by development. Satpurva became the focus of attention last fortnight following an incident in which a 55-year-old woman reportedly immolated herself on the funeral pyre of her husband

The incident, as narrated by villagers, occurred on November 11, the day Mani Ram Shah, 60, a Dalit resident of

Satpurva, died of tuberculosis After the cremation, his son Sishpal, 22, and a few other relatives went to a nearby pond for a ritual bath At that time, Charan Shah, the widow, is believed to have left home and headed for the cremation ground, where she jumped into the pyre and was burnt to death There are conflicting reports about whether Charan Shah's actions went entirely unnoticed, but it is almost certain that hardly any attempt was made to rescue her from the pyre.

Charan Shah s wilful taking of her own life, and specifically her decision to end her life on her husband's burning pyre – which evoked images of the outlawed medieval custom of sati – whipped up a storm However, there was little or no evidence that the customary rituals associated with sati had been observed in this case. And although there appears to have been an *ex-post facto* attempt by some persons in Satpurva and neighbouring villages to

R V MOORTHY

The police keep a vigil at the site where Charan Shah ended her life on her husband's funeral pyre, in Satpurva village in Mahoba district. The police have taken action to prevent any attempt to glorify Charan Shah's death or worship at the cremation site.

glorify Charan Shah's tragic death and to weave mythic tales of miracle cures of those who "worshipped" at the "sati sthal", the police appear to have concluded after inquiries that Charan Shah did not, in fact, commit sati. These findings have been corroborated by the report of a fact-finding team of leaders and activists of the All India Democratic Women's Association (AIDWA). The National Commission for Women also deputed a fact-finding team to Satpurva.

Immediately after Charan Shah's suicide, the police interrogated Sishpal and Charan Shah's brother Malkhan Singh in order to ascertain whether the widow's immediate family members knew of her intention to end her life, in the manner in which she did so. Mahoba Superintendent of Police L. Ravi Kumar, however, said the two were blameless. Sishpal said that he would have informed the police had he known that his mother was contemplating suicide.

The police, who received news of Charan Shah's death only 12 hours after it happened, did not register a first information report(FIR) on the incident, arguing that there was no evidence of sati or of abetment to suicide. In fact, the police claimed, at least two women, both in their fifties, had seen Charan Shah heading for the cremation ground and had attempted to give chase. Attempts by police officials to reconstruct the events of November 11 have been hampered by the conflicting versions given by villagers. While some people claimed that there was no reason to suspect that Charan Shah contemplated suicide, a few others said that she had indeed expressed a desire to die along with her husband. "In such circumstances, whom can we find guilty?" a police official asked.

Ravi Kumar said that there were several reasons why the claim that Charan Shah had committed sati did not ring true. One, unlike the sati incident at Deorala in Rajasthan on September 4, 1987 involving Roop Kanwar, an 18-year-old widow, Charan Shah did not proclaim her intention to commit sati, as is dictated by medieval social custom. Second, she did not observe the rites associated with sati and did not wear a bridal dress. (Her relatives claim that she asked for a new dress, but that they did not give it.) Third, no

The law, and the facts

V.VENKATESAN

UNDER the Commission of Sati (Prevention) Act, 1987, "sati" is defined as the act of burning or burying alive any widow along with the body of her deceased husband or any other relative. This definition applies, irrespective of whether the widow voluntarily submits herself to such burning or burying or is coerced or persuaded into doing so.

Under the Act, glorification of "sati" is defined as the observance of any ceremony or the taking out of a procession in connection with the commission of sati; the supporting, justifying or propagating of the practice of sati; and the arranging of any function to eulogise a person who has committed sati, or the creation of a trust, or the collection of funds, or the construction of temple or other structure, or the carrying on of any form of worship or the performance of any ceremony there, with a view to perpetuating the honour of, or to preserve the memory of, a person who has committed sati.

FOLLOWING media reports of Charan Shah's death on her husband's funeral pyre on November 11, the All India Democratic Women's Association (AIDWA) deputed an all-woman team to Satpurva to ascertain the facts of the case. The team comprised Subhashini Ali, former Lok Sabha member from Kanpur and working president of AIDWA in U.P.; and Urmila Awasthi and Sheila Narayan, leaders of the Kanpur district unit of AIDWA. The three leaders visited Satpurva hamlet on November 15 and met the members of Charan Shah's family, their neighbours, and other villagers. The AIDWA team concluded that Charan Shah's death was not a case of "sati murder"; the widow committed suicide because she did not wish to live without her husband. And there was no abetment to suicide on the part of anyone, the team noted. Charan Shah's decision to end her life had not been conveyed to anyone beforehand, and she did not dress in bridal clothes; nor were there any rituals or ceremonies associated with sati, the AIDWA team said.

Subhashini Ali told *Frontline* that in the perception of the AIDWA team, Charan Shah's death was a case of suicide. However, even if it was treated as a case of sati going by the definition of sati under the Act, against whom would the police take action, she wondered. On the basis of the team's interaction with a cross section of people in the hamlet, she affirmed that there was no abetment of any kind. Subhashini Ali said, "If you prosecute the villagers for her death, they will not be able to survive. They are innocent."

Sishpal told the AIDWA team that the police wanted him to state that his mother was mentally ill, but that he refused. He further said that a few villagers had said that if a "sati" temple came up at the site, the village would benefit: offerings would pour in, shops could be set up and a road would be built.

The AIDWA team reported that several women of the village had claimed that they had heard that Charan Shah flew to the pyre and that physically disabled people who worshipped at the site had been cured miraculously. But the women could not substantiate these claims. Their innocent belief in supernatural powers was being used by people who wish to gain commercial advantage by creating a "sati myth" and pressing for a temple, the team said. Media reports that thousands of people had visited the village were exaggerated, the report said.

The team met an influential landowner of the area, a retired Colonel whose family had donated land to Dalit families during the Bhoodan movement in the 1950s. A member of the Rajput community, he told the AIDWA team that his mother had committed sati but that they had not built a temple in her honour. Such sentiments "propagated by educated influential individuals... encourage ritualised glorification of sati," the AIDWA report noted.

There are at least three sati temples in the region, at Thathaura, Mudhari and Jaari, all of them outside Mahoba district. The AIDWA report demanded that the administration remain vigilant to thwart any attempt to build a temple to glorify Charan Shah's death, and stated that a widespread social reform movement, based on concrete developmental activity, was needed in the area. The entire Mahoba district, which is part of the Bundelkhand area (comprising the southern districts of Uttar Pradesh and the

musical instruments were played and no bhajans to "sati ma" were sung when Charan Shah took her life.

(In Roop Kanwar's case, the residents of Deorala actively participated in the sati rituals; dressed in bridal finery, Roop Kanwar, who belonged to a middle-class Rajput family, sat on her husband's pyre, which was then lit by her brother-in-law, Pushpendra Singh, a minor. Of the 38 persons who were brought to trial in the case on the charges of murder and glorification of sati, 32 were acquitted in 1996. The Rajasthan Police went in appeal before the High Court, but that case is yet to come up for hearing. Two of the accused are absconding, and the four others, whose case was to appear before the juvenile court, are out on bail.)

R V MOORTHY

Charan Shah's sons. Several social factors, principally the failure to address issues related to the status of women, underlie the tragic incident.

northern districts of Madhya Pradesh), is a drought-affected, backward region where brutal exploitation by feudal landowners is common and criminal gangs operate freely. The AIDWA report said that it was a commentary on successive governments in the State that Satpurva did not have even the basic necessities for human existence.

A FEW other women's groups and activists are rather more inclined to take a strictly legalistic view of the circumstances of Charan Shah's death and the response of the villagers of Satpurva. Kavita, an activist in Jaipur, argued that Charan Shah could have been pulled out from the pyre and given medical help. "Even if it was too late, she could have been declared dead at a hospital. Why did the villagers not do that? The villagers' mindset and the fact that some of them made offerings at the site amount to a violation of the Commission of Sati (Prevention) Act," said Kavita.

Senior lawyer Indira Jaisingh wondered how the police had, without filing a First Information Report, concluded that there was no abetment. In her view, whether Charan Shah's death was a case of suicide or sati was purely an academic question: she had already died. The relevant point is whether there was abetment by anyone. If the police had any evidence, then the Act could be invoked, she said. After all, she noted, the police were already implementing the provisions of the Act with regard to the prevention of glorification of sati. ■

LOCATED amid picturesque hills, Satpurva in Charkari tehsil was populated mainly by agricultural labourers until about 15 years ago, when some Dalits were given land to till, under the Cooperative Society Act. Today there are about 20 Dalit families, of whom some are land-owners, some are farm labourers, and others are manual labourers. The village has no electricity and no proper roads.

There is no recorded evidence that sati is practised or has social sanction among Dalits in the Bundelkhand region. However, some residents of Satpurva claimed, without adducing any evidence, that there had indeed been a few incidents of sati in the region, but that they had gone unreported. Among the villagers, currently prevailing attitudes towards sati are regressive, to say the least. Many of them seemed to consider a woman committing sati worthy of deification. They appeared to be unaware that the practice of sati had been outlawed, and that even glorification of sati would invite punishment. The few who did know about the illegality of the practice seemed to place a premium on the supremacy of faith and custom over man-made laws.

On the afternoon of November 14, when this correspondent visited the cremation site, an advocate practising at the Mahoba district court had come there with his daughter to have a "darshan" of "sati". He had walked a considerable distance to the site, and seemed to consider that the journey was worth the trouble. Asked if he did not consider his action unlawful, he admitted that it was and added that he would not advise other widows to emulate Charan Shah. Even so, he added, "sati" had enormous powers, and there was nothing wrong in worshipping Charan Shah. "Sati enters only a few widows, and only a sati could help a widow embrace death in this fashion," the advocate said. He claimed that about 30,000 people had come to the site the day after Charan Shah ended her life, and that in later days many more would have come had the police not used force.

THE police have acted to prevent any attempt at glorification of Charan Shah's death and worship at the cremation site – a barren stretch of land, with only the ashen remnants of the pyre to mark the spot. A police outpost has been set up in Satpurva, and movement of vehicles to the village is restricted. The police warned that any politician who visited the area with the intention of glorifying the death would invite penal action.

On the afternoon of November 14, a few policemen were present at the site, evidently to prevent villagers from erecting any structures at the site or offering worship. Even so, there was a clutch of curious persons from nearby villages, who had come to have a "darshan" of the "sati sthal", even if only from a distance. They were promptly shooed away by the police.

Ravi Kumar said that media coverage of the aftermath of Charan Shah's death had been less than professional, and in some cases downright dishonest. In particular, he alleged that a team from a television channel had filmed themselves offering donations at the site and had reported that throngs of people were mak-

ing donations to "sati". Contrary to media reports, there are no shops selling coconuts and agarbatis. A month-long mela, called Charkari Mela or Goverdan Mela, had begun near Satpurva from November 9, and many people from nearby villages come to attend it. A few of them visited the cremation site out of curiosity.

IN Lucknow, the government led by the Bharatiya Janata Party responded to the incident with a sense of trepidation, fully aware that it could blow up and become a cause of major embarrassment. Chief Minister Ram Prakash Gupta told *Frontline* that Charan Shah's death was a tragic case of suicide. The Government, he said, could do little by itself to change the perception among a section of people that she had committed sati. Only by raising social awareness could such beliefs be changed, and that was not something the government could do merely through administrative measures, he said.

A section of officials in the State Home Ministry initially appeared to discount the report that Charan Shah's death was a case of suicide, not sati, and that none of the rituals associated with sati had been observed. They suggested that an independent inquiry into the incident be instituted by the State Home Department, but this idea appears to have been shelved.

THE semantic tug-of-war over whether Charan Shah's death was a case of suicide or sati ignores other social factors that underlie the tragedy. Charan Shah's decision to end her life was motivated by several factors: she had lost the eldest of her three sons some years ago; her second son, who was employed as a casual labourer in Delhi, had been away from the family for years; she had been nursing her ailing husband for years. To a poverty-stricken 55-year-old Dalit woman in an underdeveloped region, life as a widow in a patriarchal, gender-insensitive social structure had little to offer, and even death perhaps seemed a deliverance. Only by addressing everyday issues related to the status of women, such as disparities in access to health care, education, employment, share of familial property and so on, can a woman's sense of self-worth in society be enhanced to a level where she no longer feels compelled to resort to acts of self-destruction in the way Charan Shah did.

■ THE STATES

Community crimes

The recent killing of two teenagers highlight the fact that women, Dalits and members of backward castes have to pay a heavy cost when conservative social codes are violated in Haryana villages.

T.K. RAJALAKSHMI
in Rohtak

IN an incident reminiscent of medieval times, two teenagers were done to death on the night of October 12 in Ismaila village, 23 km from Rohtak in Haryana. The victims, a boy from the Lohar (ironsmith) caste and a girl from the dominant Jat community, had apparently transgressed the rules set by conservative society in the matter of mutual interaction. The police found their unclothed bodies two days later in a canal near the village. Five persons suspected of involvement in the killing, including two uncles of the girl, were taken into custody.

Members of the boy's family told *Frontline* that they had been threatened by the girl's relatives and two others, allegedly hired killers, before the incident. They said that the girl's relatives claimed that the boy had had an illicit relationship with the girl and demanded that he be handed over to them. The family also denied the claim about an illicit relationship. Later in the night, the family, which is among the few backward caste families in the village, was attacked by a group of persons led by the girl's relatives. They assaulted at gunpoint members of the family, including the boy's mother, and dragged the boy out into the darkness. The cries of the family were ignored by the rest of the village, dominated by upper castes. The girl was taken away despite her mother's protests.

The Lohar family maintained that nothing wrong had happened between the youngsters. The two families stayed close to each other and the victims' mothers went to the fields together. Members of the boy's family said that the killing was intended to remind them of their place in society. The Jat girl had interacted with a lower-caste boy, and she too was seen as deserving the same fate.

The panchayat had not been convened to discuss the issue. It is alleged that the murder had the tacit approval of the police. The sarpanch, who is a law graduate, visited the girl's family after the incident but ignored the Lohar family. A member of the sarpanch's family told *Frontline* that "improper behaviour" had led to the action.

The boy's father is an armyman. His distraught uncle, who works in the Indo-Tibetan Border Police, said: "It is unimaginable that the village can gang up against our family while we fight for the country." The family was prevented from filing a first information report, but the boy's father managed to lodge a complaint. Some residents of the village allegedly warned the family against trying to take on the upper castes.

A few elderly Jats, who are at the same economic level as the Lohars, expressed their sympathy. They said: "The killing was wrong; there was nothing going on between the two victims." However, they added that it would have been "legitimate if there had been an illicit relationship between the two". One elder narrated a previous incident in their village in which a Jat girl and a Brahmin boy were killed as it was "established" that they had illicit relations.

According to Vidyabehan, a teacher and an activist of the All India Democratic Women's Association (AIDWA), the community's reaction to the incident was unsympathetic. Except for the Lohar family, most people thought that "this was bound to happen". Rather than becoming an issue of serious concern, the incident had generated salacious gossip. According to Vidyabehan, in most such cases the families arrived at a truce or the cases were withdrawn under pressure.

AT Sampla police station, a case of abduction and murder was filed against five persons. But the attitude of the police personnel was no different from that of the residents of the village. They said that this was bound to happen as the

two had an illicit relationship. "Everyone in the village knew it," said a police official.

Vidyabehan said that similar incidents had taken place some years ago in at least two other villages, Nindana and Kiloi, in the district. In both cases the local residents supported the crime. She said that it was socially reprehensible for pubescent boys and girls to interact with each other. Even harmless chatter could be misconstrued as a relationship and lead to dire consequences, she added.

Another cardinal norm that is not allowed to be broken related to village exogamy or the practice of marrying outside the village. Everyone lives by this rule, and all other relationships, if they do take place, are clandestine. If exposed, there is no escape from the wrath of the community. However, punishment for breaking the norm is used also to settle inter-caste or intra-caste scores. In the upper castes' view, this serves to keep the lower castes in their "place".

It is a matter of concern that there has been an increase in the frequency of such incidents. Barring some progressive sections, political parties and women's organisations such as AIDWA, other quarters have been silent on this. The political leadership in the State, which more or less comes from the dominant communities, is obviously loath to take up issue with members of their own caste groups.

Social and political analysts say that it is the breach of caste exogamy, the transient notions of family, caste and community honour and the low status of women that cumulatively cause such murderous behaviour. A young Dalit couple was killed in public view in Shimla village in Kaithal district in March. The couple had violated the village exogamy norm. The panchayat exiled the boy and when he dared to return, challenging the decision, the couple was lynched. Probably the only national party to react to the incident, the Communist Party of India (Marxist), called for a legal ban on panchayats that passed such lethal judgments.

In Luhari Ragho village in Hissar district, the panchayat exiled a youth for seven years on similar grounds. He was warned that if he returned before the term expired, he would be handed a more severe punishment. In Narnaund village, also in Hissar district, a young couple was caught while eloping and the boy was handed over to the police. Meanwhile, the panchayat pronounced a death sentence on the girl. When the news of her killing appeared, Left organisations put pressure on the police to arrest the culprits and in the process saved the boy's life.

In Throo village in Sonepat district, a couple went through a civil marriage ceremony outside their village. The panchayat did not recognise the marriage and it ostracised the families of the two. Two Punia (a Jat sub-caste) boys of Paintawas village, in Bhiwani district, married two Sangwan (also a Jat sub-caste) girls of Sonepat district. The Sangwan *khap* (a *khap* is a conglomeration of castes in a cluster of villages where the dominant sub-caste or *gothra* assumes the *khap* name and makes all the decisions) decided that this violated the rules of village exogamy and declared the marriages invalid. It took on the "responsibility" of getting the girls other, appropriate alliances. In Thigana village, in Jind district, the panchayat exiled three persons accused in a rape case and their families for 10 years. All these incidents show that the upper-caste dominated panchayats have a stranglehold hold on village society.

Prof. Suraj Bhan, who retired as Professor of History from Kurukshetra University in Haryana, said that the State was still in the grip of "medievalism". Despite the modernisation of agriculture and general technological advances, social attitudes had not changed. The attitude towards women had remained "medieval", he said. Reforms, if any, he added, had been revivalist in nature. Compared to other States, there were no sharp cleavages between Jats and non-Jats and therefore the upper castes operated as a clique. Community killings were an example of the clique mentality, he said.

Panchayats are dominated by landlords and their henchmen. Some of them are strong advocates of casteism. Even

In Ismaila village, Haryana, the mother (second from right) of the teenager who was killed along with a Jat girl.

though sections of the peasantry have access to education, the teaching practices in educational institutions has been unscientific and *status quo*ist. Although untouchability and a strong brahmanical culture are absent in Haryana's social structure, the canker of casteism is present in the polity, the bureaucracy and the law-enforcement agencies.

Depending on the social and economic status of the families involved, panchayats follow different standards to deal with inter-caste or intra-caste alliances. If a couple belongs to the same caste, an attempt is made to settle the conflict quietly. In the case of a relationship between an upper-caste girl and a lower-caste boy, the death penalty is usually awarded, but in the reverse case, the influence of the boy's family would count.

Secretary of the CPI(M) State unit, Inderjit Singh, said that rules about village exogamy were not even uniform across the State. He said that in Sirsa district and even in the village from which Chief Minister Om Prakash Chautala hailed, village endogamy or even *khap* endogamy was not taboo. He said that the mix of consumerism and feudalism had left the value system skewed, with women and members of backward castes and Dalits facing the worst consequences. He found it disturbing that the murderous acts had social sanction and said that they were linked to the popular perception that the stigma of inter-caste and intra-caste relationships affected future alliances. He said that the majority of panchayat-sanctioned murders or community lynchings were not reported.

R.S. Hooda, a leading criminal lawyer in Rohtak, said that the other sections of society were united against Dalits. Of the murders in Ismaila village he said that the Lohars were a landless artisan community and although members of this caste were engaged in agricultural operations, they were considered "menial". He said that the forward castes did not tolerate cohabitation with other castes. More so, it was the *khap* brotherhood that was considered inviolable. He said that even when there were signs of the brotherhood weakening, political parties encouraged such feelings as they provided them with a captive vote-bank.

The Ismaila incident is probably not the last one in the list of inhuman community killings. There can be no real progress as long as medievalism raises its head from time to time. ■

Digging up the past

Painful memories from Punjab's decade of terror continue to haunt families and institutions in the State.

PRAVEEN SWAMI
in Chandigarh

SEVEN years ago, 22-year-old Harjit Singh was killed. Through all these years, inquiry after inquiry, investigation after investigation, have sought to lift the multiple veils that shrouded his death. Now, a Central Bureau of Investigation (CBI) probe appears to have brought Harjit Singh's story closer to resolution than ever in the past. But the CBI's findings give no solace to either the Punjab Police or human rights organisations. If anything, they necessitate a painful examination of events in Punjab through its decade of terror.

From the outset, every fact about the death of Harjit Singh was sharply contested. His family insisted that he was picked up on April 29, 1992, while the Punjab Police maintained that he was in fact arrested almost a fortnight later, on May 11, from a bus stand at Thatian village near Baba Bakala. After interrogation, police officials say, he was taken the next day to an arms dump he had identified. There, police and Central Reserve Police Force (CRPF) personnel were ambushed by terrorists. Harjit Singh and two others were killed in the firing. Police officials claim that Harjit Singh, long suspected of terrorist activities, was armed when arrested.

Kashmir Singh, Harjit Singh's father, had a very different story to tell. His son, he believed, was alive, but in illegal police detention. Kashmir Singh moved a *habeas corpus* petition before the Punjab and Haryana High Court, claiming that his son was being held in Amritsar's Maal Mandi Joint Interrogation Centre (JIC). On October 15, 1992, Justice H.K. Sandhu held that there was enough evidence to investigate Kashmir Singh's claims, and appointed a Warrant Officer to search the Amritsar JIC for Harjit Singh. Two days later, Warrant Officer R.L. Bhatia, Kashmir Singh, his relative Anoop Singh and friend Shingara Singh reached the gates of the JIC.

What happened at the Amritsar JIC lies at the heart of subsequent events. A junior police official, by accident or design, refused to allow the Warrant Officer access to the JIC. A protracted argument followed, until a Senior Superintendent of Police (SSP) finally read the court order Bhatia carried and allowed the group in. Meanwhile, Kashmir Singh and Anoop Singh claim to have seen Harjit Singh gesturing to them from one of the JIC's barred windows. But by the time they were allowed into the JIC cell from where they thought they had seen Harjit Singh, the room was empty.

Outraged by the delay in granting Warrant Officer Bhatia access to the JIC, the High Court ordered a Sessions Judge to investigate the affair. Chandigarh Sessions Judge Amar Dutt took over the inquiry in 1993, but proceedings dragged on until the summer of 1995, and ended with the case being referred to the CBI.

Meanwhile, Harjit Singh's supposed disappearance became the centrepiece of Amnesty International's campaign on Punjab. In 1993, the organisation used Harjit Singh's case to illustrate "the lives behind the lies" the Indian government had put out on Punjab. In 1995, it argued that Harjit Singh's disappearance was just one of "scores of disappearances following arrest by the police in Punjab".

Judge Dutt's inquiry report, when it finally became available, established few facts. Constrained by a lack of official cooperation, it concluded that neither the government nor the Punjab Police had "cared to bring on record evidence" to support their contention that Harjit Singh was dead. Nor, it said, had they "made any attempt to clear the doubt that has been raised by the statements of these witnesses that Harjit Singh may possibly be present in the premises of the Interrogation Centre." No post-mortem report on Harjit Singh was produced; nor were witnesses who identified his body brought before the Sessions Court.

Through the three years of Judge Dutt's inquiry, a succession of Harjit

Singh sightings were reported. Police officials reacted to most of the reports with disdain. One, where witnesses claimed to have seen Harjit Singh at the back of a moving police jeep at 200 metres, provoked outright derision. Officials pointed out that the Maal Mandi sighting was also dubious, given the distance of the window from the JIC gate and the darkness of the cell. Nonetheless, the campaign for Harjit Singh remained firm in its assertions. As late as February 1996, an Amnesty document claimed "it appears that Harjit Singh, who is married with two children, may still be alive".

Investigators of the CBI, who examined the case on Judge Dutt's orders, have discovered a third narrative. It lies outside the stories of the Punjab Police and Kashmir Singh, and in the politics of Thatian village at the height of Khalistan terrorism. The CBI has now asked the Punjab Government to sanction the prosecution of six police officials, Constables Daljeet Singh, Dharam Singh and Harbhajan Singh and Assistant Sub-Inspectors Ram Lubhaya, Surinder Singh and Amrik Singh, along with one villager, Mottu, for Harjit Singh's murder. But the CBI investigation's core is not its recommendation for prosecution, but its revelations on the background to the killing.

Harjit Singh's sister, the CBI investigation found, had a long-standing affair with Baljit Singh, a resident of the same village. Word about the affair had presumably reached Harjit Singh. On at least two occasions, Harjit Singh had bitter exchanges with Baljit Singh that led to street brawls. After one such brawl, Baljit Singh was killed by unidentified terrorists. He joined the thousands of civilians, mainly Sikh, killed by terrorists in the course of village feuds and local political disputes through the 10-year battle for Khalistan.

Baljit Singh's brother Daljit Singh 'Mottu' believed that Harjit Singh was responsible for the murder. He perhaps had some reason to do so. The young Harjit Singh had secured a job in the Punjab State Electricity Board (PSEB) during the years of violence. The PSEB, for much of the period, had been made captive by the Bhindranwale Tiger Force of Khalistan (BTFK) and put to work to buy legitimacy for the terrorist organisation. Slips signed by BTFK boss G.S. Manochahal led to hundreds of jobs being handed out at gunpoint. As an occasional police informer, Daljit Singh probably had a good idea of Harjit Singh's ideological leanings and his local BTFK contacts.

Death is not an infrequent outcome of village romance in Punjab. In normal circumstances, a case would have been filed and Harjit Singh tried for murder. But Punjab in 1992 was not normal. The courts, which are now energetic in the pursuit of human rights violations, had for all practical purposes ceased to exist. Where terrorism-related offences were concerned, the chance of securing a fair trial, let alone a conviction, were minimal. Police officials working overtime fighting terrorism, in any case, had no time to deal with village murders. But Daljit Singh wanted revenge for his brother's death, and the local police owed him a favour or two.

The CBI has found that Harjit Singh was shot dead on May 12, 1992, just as the Punjab Police had long claimed he was. However, there was no encounter. The PSEB employee was taken to a deserted field and shot dead in cold blood. Sources in the CBI told *Frontline* that one police official had confessed during interrogation that he was ordered to fudge records on the encounter-that-wasn't. Whether the station official will repeat his account when his six colleagues are tried remains to be seen, but on the basis of the evidence made available by the CBI, it appears probable that the Punjab government will grant the legally mandatory permission to prosecute.

In important senses, the real subject of the prosecutions will not be Harjit Singh's murder, but the truth about Punjab. Most right-thinking people will be appalled, in some ways rightly, that six police officials took it upon themselves to execute summarily a murder suspect. And many will, again rightly, conclude that this kind of instant justice was not rare in Punjab between 1982 and 1992. These twin facts, irreconcilable with core liberal belief, have underpinned the judicial and civil rights inquisition directed at the Punjab Police after the restoration of peace in 1993. The prosecution of Harjit Singh's killers will join the ranks of hundreds of cases faced by Punjab Police personnel.

BUT this case, like many others, raises disquieting questions. If the CBI version is true, the six indicted officers were in some senses just doing their job. In a context where the entire apparatus of state had disappeared, leaving only the police fighting desperately to secure the peace, Assistant Sub-Inspectors Lubhaya and Surinder Singh were trying to deliver justice to the victim of a crime as best as they could. Both they and Daljit Singh assumed there was no other way to punish Baljit Singh's killers.

Figures who faced the Khalistan assault have always understood the problems liberal faith encounters when the order it rests on breaks down. Communist Party of India (Marxist) workers Balwinder Singh Sandhu, his wife Jagdish Kaur Sandhu, his brother Ranjit Singh Sandhu, and Ranjit Singh's wife Balraj Kaur Sandhu held off armed attacks on their home, using automatic rifles and a light machine gun illegally supplied to them by the then SSP, Ajit Singh Sandhu. The four Bikhiwind comrades were awarded the Shaurya Chakra, India's highest civilian gallantry honour, becoming the sole family to have multiple recipients of the award.

When SSP Ajit Singh Sandhu committed suicide last year, as a result of a series of human rights cases he believed degraded his honour, the comrades were among the few who spoke out in his defence. "People can say what they like," Balwinder Singh told *Frontline* last September, "but those times will never be understood by anyone who did not live in rural Punjab then." "Perhaps the police killed a few innocent people, but as far as I'm concerned, that's a sad but acceptable price. It was a war, and it had to be fought. There was no government, no courts, no judges then. There were no choices."

The CBI's findings speak of the pain of an old man; a pain which led him to imagine seeing his dead son time and time again. If correct, they also speak of the cynicism of people who did not see Harjit Singh, because they could not have seen him, but authored the fiction that he was alive, for ideological ends. Anoop Singh, for example, claimed that the police attempted to kidnap him on November 6, 1992 in an effort to silence his claims to have seen Harjit Singh alive. Harjit Singh was not alive then, and the attack, if it took place, must have been provoked by anger against Anoop Singh's evident lies. These and other lies, official and private, drove the Harjit Singh affair from its outset to its end.

In a court of law, the six indicted police officials, if they are indeed guilty, may have to tell another lie. They will almost certainly plead innocent and insist that Harjit Singh was indeed killed in an encounter. They may do so because he in fact did. They may also do so, sadly, because the legal system offers no room for the truth about Punjab's 10-year carnage to be told. ■

Catching up with corruption

After a prolonged legal battle, a Special Court in Kerala awards five years' rigorous imprisonment to a former Minister in a corruption case.

R. KRISHNAKUMAR
in Thiruvananthapuram

THE long arm of the law appears to have finally caught up with R. Balakrishna Pillai, Kerala's former Electricity Minister. On November 10, delivering its verdict in a corruption case related to the Idamalayar hydel project, a Special Court sentenced him to five years' rigorous imprisonment and a fine of Rs.10,000. Balakrishna Pillai and two others, K. Ramabhadran Nair, former Chairman of the Kerala State Electricity Board (KSEB), and P.K. Sajeev, former Member of the KSEB's consultative committee, who received similar sentences, got a reprieve the following day as the High Court, admitting an appeal, suspended the sentence for six months and granted them bail. All the three avoided spending a day in prison on medical grounds.

Given the time it took for the case to reach the trial stage – during which Balakrishna Pillai had been in and out of ministerial office, and was similarly on bail in another corruption case – it is a moot point where its significance lies, in that a case involving such a high-profile politician took so long to reach the present phase or in that it reached this phase at all.

In the 10 years since a judicial inquiry found Balakrishna Pillai and some others guilty of abuse of power in the award of contracts for the project, investigations by a special police team and subsequent legal proceedings had taken the much-too-familiar road: the prosecution trying to sabotage the case; prosecutors and judges resigning or being replaced; appeals to the higher courts, including the Supreme Court, at every turn; and controversial government decision at one stage to drop the case in its entirety with the sanction of the High Court, on the basis of the argument that it was politically motivated. It was the single-minded pursuit of Communist Party of India (Marxist) leader and former leader of the Opposition in the State Assembly (now convener of the ruling Left Democratic Front) V.S. Achuthanandan, who went on appeal in the Supreme Court, that resulted in the resurrection of the case in the High Court. The final verdict is yet to be delivered as Balakrishna Pillai and others have gone on appeal, but the Special Court order has brought the case into focus.

Several high-profile politicians (coincidentally, belonging to the Congress(I) and its allies) of the State are on trial for corruption and other serious offences. The twists and turns in the investigation and the unending trials that eventually push such cases out of public memory have almost gained acceptance as a fact of life. Idamalayar could, however, become an exception. In a way it justifies Balakrishna Pillai's observation that his political opponents were vindictive in pursuing the case. He is the leader of one faction of the Kerala Congress.

JOHNY THOMAS

R. Balakrishna Pillai, former Minister, being brought out of the court after he fainted following the delivery of the verdict.

THE multi-purpose Idamalayar project, located about 80 km from Kochi on the Idamalayar river, a tributary of the Periyar, was conceived in 1966 to generate 75 MW of electricity, to irrigate paddy crops in Ernakulam and Idukki districts and to prevent salt water intrusion into the Periyar. The Mumbai-based Hindustan Construction Company was the original contractor for the project, the cost of which was then estimated at Rs.23.40 crores. Later, in a controversial decision, the KSEB awarded the contract for the tunnel and surge shaft of the dam to K.P. Paulose, a co-accused. The project was completed in 1986, and by March 1989 Rs.90 crores had been spent on it.

Idamalayar began to arouse controversy in July 1985 when, during a trial run, cracks and leaks were detected in the tunnel and the surge shaft. Suspicions were raised about the quality of construction and fears were expressed about possible corruption in the execution of the project. Balakrishna Pillai, who was a Minister in the United Democratic Front (UDF) Government between 1982 and 1986 when the contracts were awarded, was out of office when the leaks were detected.

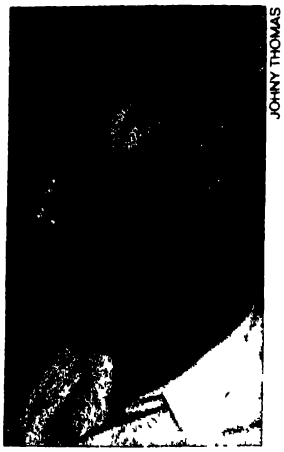
Balakrishna Pillai's party was a constituent of the ruling UDF when the Assembly's Public Undertakings Committee visited Idamalayar and recommended a judicial inquiry. Following similar demands from Opposition parties, Chief Minister K. Karunakaran appointed in 1986 a commission of inquiry

headed by Justice K. Sukumaran. The commission submitted its report to the E.K. Nayanar-led LDF government in June 1988. The report named Balakrishna Pillai and several others, including another former KSEB Chairman G. Ganesha Pillai and former Secretary, Irrigation and Power, G. Gopalakrishna Pillai, liable for acts of abuse of power.

The Government accepted the recommendations of the commission and constituted a special police team for further investigations. Based on the police report, the LDF Government constituted a Special Court in 1991 to try the case. What followed was a long process of hedging the due process. Judges of the Special Court were replaced three times and the public prosecutors eight times. After the 1991 Assembly elections, when the UDF returned to power with Karunakaran as Chief Minister, Balakrishna Pillai was once again made Minister (this time incharge of Transport). He appealed to the Supreme Court against the validity of the Justice Sukumaran Report. The apex court rejected the plea.

JOHNY THOMAS

P.K. Sajeev, former Member of the Consultative Committee of the KSEB, being helped out of the court premises following the verdict.



In August 1992, by which time Gopalakrishna Pillai became Additional Chief Secretary, the Karunakaran Government decided to drop the prosecution charges against him, claiming that the case was politically motivated and hence demoralising to the officials who were implicated. When this argument was rejected by the Special Court, the State Government went in appeal to the High Court. Justice Chettur Sankaran Nair allowed the prosecution to drop the charges against Gopalakrishna Pillai, observing that the Government could decide on dropping charges against the other accused as well. Following this, the UDF Government decided to withdraw the entire case.

It was at this stage that Achuthanandan petitioned the apex court. The Supreme Court criticised the High Court decision and ordered the Special Court to continue its proceedings.

Although resurrected, the trial once again hit snags when Balakrishna Pillai moved the High Court on the plea that the Governor's sanction was necessary to prosecute a Minister. His appeal was rejected. Balakrishna Pillai resigned when the Special Court found him and 11 others *prima facie* guilty of charges. When the final proceedings began in the Special Court in February 1996, the accused once again approached the High Court unsuccessfully. The request this time was that the case be dropped because of the delay in the proceedings.

Special Judge R. Natarajan, in his verdict given on November 10, said that there was enough evidence to prove that Balakrishna Pillai, Sajeev and Ramabhadran Nair had entered into a criminal conspiracy with Paulose, who had been awarded the contract for the construction of the surge shaft and the tunnel. The two contracts were awarded on the basis of such a conspiracy, because of which the KSEB accepted the special conditions set by the contractor, although they were detrimental to its interests, the judgment said.

The court observed: "A Minister who had the mandate of the people to rule the State had indulged in a criminal conspiracy with the contractors to make illegal profit and that too at the expense of the KSEB."

JOHNY THOMAS

K. Ramabhadran Nair, former KSEB Chairman.

In another damning observation against Balakrishna Pillai, the court said: "As an elected representative of the people, everyone had expected that he would prevent any act of malfeasance committed by an officer of the Board. But this person had colluded with the officers and influenced some of them for personal gain, causing loss to the Board and to the people of the State." Pointing out that the offence committed was of a very serious nature, the court said that such offences committed by persons in authority had to be dealt with seriously

Seven other accused, including Gopalakrishna Pillai and Ganesha Pillai, were acquitted. Paulose and another accused died during the pendency of the case.

Achuthanandan described the Special Court verdict as "fairly satisfactory, despite the long delay and given the evidence that was available." Balakrishna Pillai described it as the consequence of political vindictiveness. He said: "It will not reduce people's support for me... If the CPI(M) is trying to confine me in jail, I will fight them from jail."

Balakrishna Pillai said that he had merely taken the initiative to accelerate the pace of a pending project. He said that the KSEB made a profit of over Rs.500 crores through the project in the last 15 years. If the charges of corruption and poor construction were true, could the project have run so well, he asked.

The Idamalayar case is the second corruption case involving Balakrishna Pillai. In 1996, the Inquiry Commissioner and Special Judge, Thiruvananthapuram, found him guilty of corruption in the "Graphite case". The case pertains to the sale of electricity to Graphite India Ltd, a private company in Karnataka, without the knowledge of the State Government or the KSEB between 1982 and 1987. Balakrishna Pillai was sentenced to rigorous imprisonment for one year and a fine. He is now on bail in that case. ■

Emerging patterns

The four-part analysis of the 1999 Lok Sabha election results, undertaken by the Centre for the Study of Developing Societies (CSDS), New Delhi, in association with a network of scholars from around the country, and co-sponsored by *Frontline*, draws to a close with this instalment that consists of an examination of the verdict in the States of Bihar, West Bengal, Madhya Pradesh, Rajasthan, Gujarat and Orissa. The earlier instalments included a three-part examination of the all-India patterns of the verdict and a closer examination of the verdict in the States of Uttar Pradesh, Maharashtra, Andhra Pradesh, Kerala, Karnataka and Tamil Nadu.

The State-wise interpretation combines analysis of the official election results with the findings from a nation-wide post-poll survey, National Election Study (NES) 1999. In attempting to unravel what lies behind the results in these States, the analysis focusses on regional variations and the voting behaviour among different social groups. The findings are put in context with reference to the 1998 Lok Sabha elections.

The NES is based on a nationally representative, randomly selected sample, and is part of a larger series of surveys examining the Indian electorate that stretches back to 1967. (For a more detailed methodological note on how the survey was conducted, see part two of the analysis in *Frontline*, November 19.)

While the sample is representative for the country as a whole, it is not necessarily representative for each of the States analysed here. The sample size for each State is mentioned in each article. Wherever the sample size of a particular group is statistically small, the particular row has been marked with an asterisk, and the findings treated with caution. Similarly, wherever the survey has over-represented or under-represented the vote-share for the leading parties, the fact has been mentioned. However, these discrepancies do not seriously affect the broad conclusions since the errors tend to be evenly distributed across respondents from different social backgrounds.

Sharp polarisation in Bihar

CSDS Team

IN a straight contest in Bihar, the Bharatiya Janata Party and its ally, the Janata Dal (U), won 41 of the 54 Lok Sabha seats and polled 43.8 per cent of the votes, while the Rashtriya Janata Dal-Congress(I) combine won 11 seats and polled 37.1 per cent of the votes. If the number of seats won is the only indicator of success, then it can be assumed that the BJP-JD(U) combine registered a massive victory in a one-sided contest. But the margins of victory present a picture of a somewhat keen contest. The difference in the vote-shares of the two alliances is close to 7 percentage points; the results in 22 constituencies were decided by margins less than a 5 per cent of the votes polled. In 1998, the victory margin was narrow only in 17 constituencies. In fact, of the last three elections to the Lok Sabha, the recent round was the most keenly contested in Bihar.

Compared to its performance in 1998, the RJD-Congress(I) alliance suffered a major loss. However, in terms of votes the RJD, with 28.3 per cent of the popular vote, remains the single largest party in the State. In fact, it managed to increase its vote share by a little under two percentage points.

The success of the alliance cannot be credited primarily to the rise of the BJP in the State. Although the BJP increased its seats tally by three, it lost one percentage point in terms of vote share. This, of course, might be owing to the fact that it contested fewer seats. To a greater extent, the success of the alliance can be attributed to the merger of the Samata Party and the Janata Dal with the Janata Dal (U) and the formidable alliance worked out by the BJP, the JD(U) and the Bihar People's Party (BPP). This led to a consolidation of anti-Laloo Prasad Yadav votes across the State. Although the JD(U)'s vote-share fell by nearly four percentage points (considering the combined vote for the Samata Party and the undivided Janata Dal in 1998), the constituents of the alliance managed to increase their joint tally by seven seats.

The regional patterns show that although there were no major gains or losses for the two alliances in South and Central Bihar, there was a reversal of fortunes in North Bihar, which accounts for the largest number of seats – 26. In 1998 the RJD-Congress(I) combine won 16 of the 22 seats it won in Bihar. This time the alliance was practically decimated. Despite an increase of 3.8 percentage points in its vote-share, its seat tally dropped sharply to four. The Communist Party of India (Marxist) won the Bhagalpur seat,

Caste and voting: a sharp polarisation in Bihar

(percentage agreed)

Caste	RJD-Cong(I)	BJP-JD(U)
Rajput	8	92
Other upper caste	13	86
Kurmi-Koeri	19	79
Yadav	79	20
Lower OBC	27	55
Dalit	49	43
Muslim	79	19

Sample size in Bihar is 716.

Education and voting: An edge for BJP among all sections

(percentage agreed)

Education	RJD-Cong(I)	BJP-JD(U)
Matric and above	42	54
Middle	41	53
Illiterate	42	49

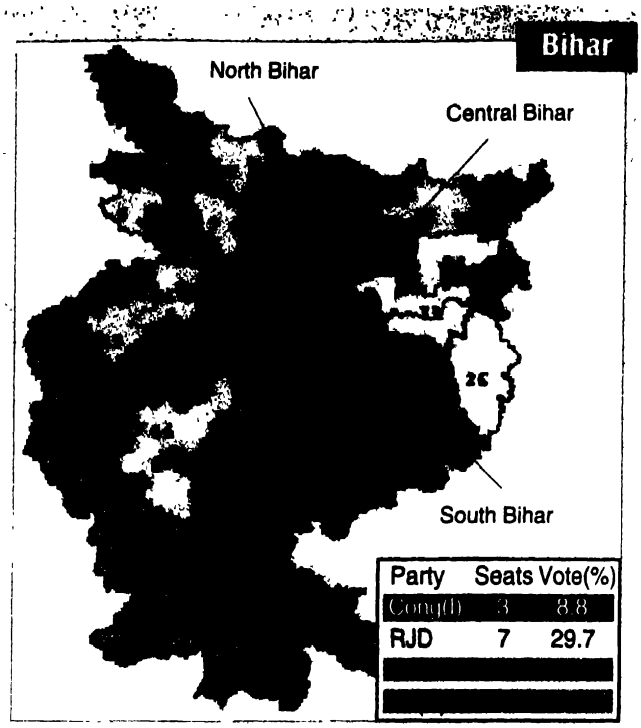
BJP more popular among rich than poor

Class	RJD-Cong(I)	BJP-JD(U)
High	37	57
Middle	44	52
Low	40	51
Very low	41	48

with support from the RJD and the Congress(I). All the gains that the BJP-JD(U) made in the State came from this region.

The merger of the Samata Party and the Janata Dal resulted in a shift in the voting pattern of different communities in Bihar. The new alliance, however, failed to transfer *en masse*, the support base of the Janata Dal to the BJP-JD(U) combine. The decrease in the number of votes polled by the BJP-JD(U)

The merger of the Samata Party and the Janata Dal resulted in a shift in the voting pattern of different communities in Bihar... Caste is still the most important political cleavage factor in Bihar.



compared to the performance of the BJP-Samata Party-Janata Dal in 1998 bears testimony to this.

The community-wise table makes it clear that Rajputs, other upper castes and Kurmis and Keoris strongly supported the BJP-JD(U) combine. By contrast, Yadavs and Muslims were clearly favoured the RJD-Congress(I) alliance.

The BJP-JD(U) combine retained its strong support base among Rajputs, which was evident in the 1998 elections, and managed to transfer to itself the votes of the other upper castes that supported the Janata Dal. The inclusion of the Janata Dal in the alliance also consolidated votes of Other Backward Classes such as Kurmis and Koeris. These groups had supported the BJP-Samata Party in 1998 and so it is not surprising that the merger helped consolidate their support bases.

The lower sections of society had generally stayed away from the BJP, and it was uncertain whether Muslims, the Scheduled Castes and those Yadavs who had voted for the Janata Dal in 1998 would shift their allegiance to the BJP-led alliance. The CSDS survey answers some of these questions. In 1998, 25 per cent of Muslims had voted for the Janata Dal, whereas the BJP-Samata Party combine gained virtually no Muslim support. The transfer of Muslim votes has taken place; from the fact that the BJP-JD(U) has secured 19 per cent of the Muslim vote, it is clear that the Janata Dal was able to take most of its Muslim vote with it. Similarly, the JD(U) was able to transfer its Dalit vote base to the alliance. Ram Vilas Paswan managed to carry along with him a large percentage of the Dalit vote to the new alliance.

However, it was a different story with Yadavs. In 1998, the Janata Dal headed by Sharad Yadav won 25 per cent of the Yadav vote. It was widely expected that the merger and the formation of the alliance would lead to a shift of Yadav support to the

BJP-JD(U) combine However it was the RJD alliance that benefited from a greater consolidation of Yadav votes the support of the community for the RJD led alliance rose from 66 per cent in 1998 to 79 per cent

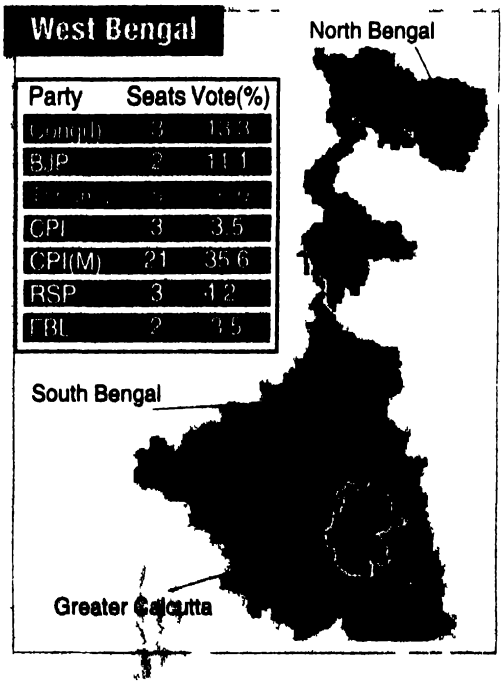
The class profile in Bihar for the two main formations is not as striking as it was in the early 1990s Although the BJP-JD(U) combine is the most popular among the upper class it draws considerable support from the lower classes as well In fact it is no longer true that the RJD Congress(I) enjoys greater support among lower class voters Laloo Prasad Yadav s early success came from the fact that he was able to consolidate the lower castes/ lower classes votes The survey found that in this round of elections, the RJD chief's monopoly over the votes of the poorest sections of society was broken

The voting pattern of the educated sections reveals a similar trend In each education-wise stratum, the BJP-JD(U) enjoyed greater support than the RJD-Congress(I) The BJP-JD(U) received proportionately more support among educated voters than uneducated voters

The survey findings thus show a sharper contrast in the voting patterns of different castes than of different classes and educational strata Caste is still the most important political cleavage factor in Bihar

With the Assembly elections due in March next, the Lok Sabha results may provide a useful indicator of the shape of things to come The data released by the Election Commission have made it possible to speculate on what the overall tally of seats in the Assembly would be Had the Assembly and Lok Sabha elections been held simultaneously, and the electorate voted in the same manner for each, then the BJP-JD(U) combine would have won a convincing majority, 177 of the 279 seats for which data are available, and the RJD-Congress(I) would have won 81 It remains to be seen whether Laloo Prasad Yadav, one of the most adroit political entrepreneurs Indian politics has seen, can stem the tide for the RJD ■

West Bengal: Limited losses for the Left



CSDS Team

IN the Lok Sabha elections of 1998 the Left Front in West Bengal received a jolt when the newly formed Trinamul Congress displaced the Congress(I) as its main rival and picked up seven seats Many observers read it as the beginning of the end of the Left Front s uninterrupted dominance of West Bengal politics since 1977 The electoral battle this year was widely perceived as a major trial of strength for both the parties which would provide enough hints about the outcome of the State Assembly elections, which are due in 2001

A quick glance at the results suggests that the Left Front has not lost, as much as it would have lost had the 1998 trends continued To be sure, it lost four seats this time It is for the first time since 1984 that the Left Front has conceded as many as 13 seats to its opponents Far from being able to snatch from the BJP the only seat it won in 1998, the Left Front conceded another seat Yet, what looked like a surge of the Trinamul-BJP combine seems to have slowed down In terms of vote share, the Left Front's losses were negligible this time, though at 47 per cent it stood much lower than the Left Front's vote share in the 1989 and 1991 elections The Trinamul-BJP combine increased its vote share only by a little over two percentage points

Perhaps the key aspect of the verdict is the ability of the Congress(I) to survive, despite having been reduced to the third place in the 1998 elections In India's first-past-the post electoral system, such results normally cause a political party to take a nosedive in subsequent elections But the Congress(I) lost only two percentage points in its vote share In fact, it was even able to consolidate its votes and win two seats in addition to Malda, which it retained Clearly, although the overall vote share of the Left Front in the latest round was far below its peak, the Trinamul-BJP combine could not consolidate any anti-Left votes in its favour

The Congress(I) did retain not only its share of about a quarter of the votes in north Bengal, but a substantial share of

Left Front loses more urban voters than rural

	BJP-Trinamul	Left Front	Cong(I)
Rural	39	50	10
Urban	50	38	12

The Left Front retained its own votes to a slightly smaller extent compared to the BJP but made up for the loss by snatching some Congress(I) votes... The Congress(I) lost more to the Trinamul Congress than to the Left Front.

the votes in Greater Calcutta, much to the chagrin of the Trinamul-BJP alliance Although Mamata Banerjee and her allies maintained their dominance of the urban cluster in Greater Calcutta, they lost a seat here to the Left Front The best news for the Trinamul Congress-BJP alliance is that it has begun to make inroads into the rural hinterland of south Bengal, hitherto an impregnable fortress of the Left Front The alliance added three percentage points of votes and three seats to its tally in this region

The flow of votes as revealed by the CSDS survey shows that the Trinamul-BJP combine retained the votes that it had polled last year. It also gained 24 per cent of the Congress(I) votes of last time. The Left Front retained its own votes to a slightly smaller extent compared to the BJP but made up for the loss by snatching some Congress(I) votes. On balance, the Congress(I) lost more to the Trinamul Congress than to the Left Front Had the exodus to the Trinamul Congress been on a larger scale, the Left Front could have been in real trouble, and the contest would have taken on a clearer bipolar character

The electoral support base of the Left Front has a pro-lower-class profile, but not quite as sharply as in Kerala Although it does best among the lowest section of society, it does very well among the highest too The Congress(I) in West Bengal does better among the well-off than the poor, which is contrary to its usual profile elsewhere in the country The Trinamul Congress-BJP does best among the middle categories, thanks to the respective profiles of the two parties cancelling each other out to a large extent. The Trinamul Congress has a slight lower-class profile (it polled 35 per cent among this section) whereas the BJP performs best among the better-off sections of the population (it received 26 per cent of the votes from the middle')

Although caste-based polarisation is not as sharp in West Bengal as it is elsewhere in the country, caste still makes a difference Compared to 1998, the Congress(I) lost support among the upper castes and Muslims and yet suffered virtually no loss of support among the Other Backward Classes (OBCs) and the Scheduled Castes (SCs) The Left Front lost out noticeably only among the Vaishyas, whose support for it fell by 10 percentage points In both these cases the beneficiary was the Trinamul Congress-BJP alliance The Trinamul Congress) was successful in mobilising support across caste and community lines Compared to 1998, its vote share among Kayasthas (an upper caste), Namasudras (a Schedule Caste), and Muslims rose by 12 9 and 15 percentage points respectively

The Left Front is most popular among middle aged voters, the formative moment in whose political consciousness was when the Left Front made its triumphant entry into State power 20 years ago

Although the Left Front is still the party of choice for rural voters, of whom 50 per cent voted for it, it has been displaced by the Trinamul Congress-BJP combine as the most popular party in the urban areas In 1998, the Left Front enjoyed a 15-percentage-point lead in vote share over the Trinamul Congress-BJP in the case of urban voters In 1999 it suffered a 12-percentage-point deficit ■

Clear lines of cleavage in Gujarat

CSDS Team

EVEN as several incumbent State governments were taken to task by the voters in the latest round of elections, the Bharatiya Janata Party survived the anti-incumbency factor in Gujarat. It won 20 seats, improving on its 1998 tally by one seat. Congress (I) won six seats, one fewer than its 1998 tally.

There was some consolation for the Congress (I) because its vote share, relative to 1998, increased by nine percentage points. As the BJP too improved its vote share – by 4.2 percentage points – the Congress (I)'s gains did not translate into seats. The deciding factor was that the BJP had big margins to defend, which the Congress (I) did not have to do.

Gujarat was one of the few States where the Congress (I) was on a stronger footing since 1998 because Shankarsinh Vaghela, who has a significant political base in the State, had joined its fold. This paid dividends in the north, where the Congress (I) captured three seats and increased its vote share by 16 percentage points.

The sharp decline in voter turnout since 1998 may have played an important role in determining the outcome. The low turnout may have favoured the BJP.

The BJP's ascendancy in Gujarat politics occurred in the 1980s, when the party rode on successive waves of communal violence. It appears that these scars still remains. Deep social cleavages have manifested themselves as the support bases of the two parties. As expected, the BJP fares well among the upper castes and Patidars, the Chief Minister's caste, and also among the more backward sections of the Other Backward Classes (OBC). Conversely, the Congress (I) has done well among the Scheduled Castes, the Scheduled Tribes and Muslims. The Vaghela factor worked with the peasants among the OBCs.

The divisions are evident even more strikingly with respect to class: a considerable degree of class polarisation was evident in the elections.

Gujarat thus seems to be one State where the line of partisan conflict maps the cleavage lines of social and economic conflict very closely. ■

When your child takes the first step, it's time to take yours...

Presenting

BAL VIDYA

A single premium policy for children

No planning is too early no expense is too much when it comes to securing your child s future We understand your concern and have designed a policy specifically for you Bal Vidya

BENEFITS

Survival benefits (three stages)

a) Monthly payment starting from the policy anniversary after the child attains age) or after 2 years from the date of commencement of policy whichever is later

b) An amount equal to the sum assured payable on the policy anniversary after the child completes 18 years of age

c) On the policy anniversary after the child becomes 2 3 years old the sum assured along with guaranteed additions and loyalty addition, if any will be paid since it is a without profit plan

Death benefit

If the parent/guardian dies during the term of the policy an amount equal to the sum assured will be paid

Eligibility conditions.

1)Age of child	0 to 12 years
2)Minimum age of parent proposer	20 years
3)Maximum age at maturity of policy	70 years
4)Sum Assured	Rs 25,000/ to Rs 10,00,000/ in multiples of Rs 25,000/

For more details contact your nearest LIC branch or agent It's your first step towards insuring your child s future

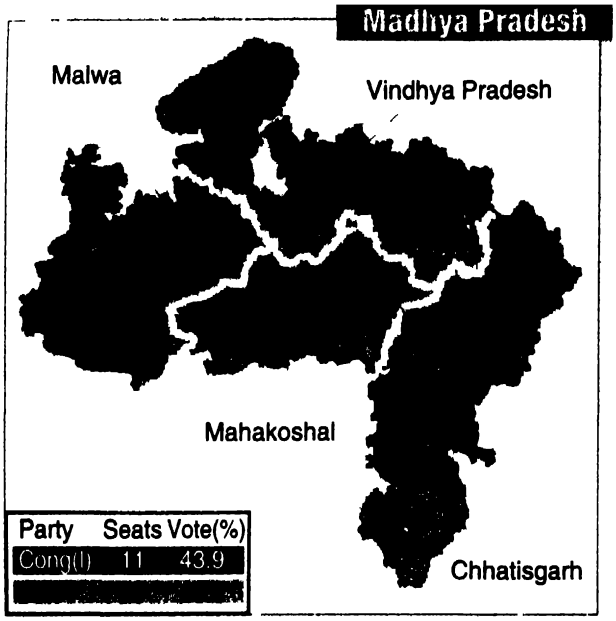
In the service of the people

Gains for the BJP

CSDS Team



ON the face of it, the Bharatiya Janata Party dominated the Lok Sabha elections in Madhya Pradesh, winning 29 out of the 40 seats. However, as is often the case in first-past-the-post electoral systems, the contest was much closer in terms of votes. The BJP's 18-seat victory margin over the Congress(I) is a hefty reward for a narrow three percentage-point lead in votes. Although the Congress(I) snatched only one seat from the BJP, it managed to cut down its vote deficit by increasing its vote share by 4.5 percentage points relative to the 1998 verdict. The BJP also increased its vote share, albeit by less than one percentage point. The rise in the vote share of both major parties means a further consolidation of a bipolar system in the State, largely at the expense of the Bahujan Samaj Party (BSP). The latter, which after the 1998 elections looked likely to emerge as a party of the future, suffered a severe setback; it won just 5 per cent of the votes.

The region-wise picture reveals some minor changes in the voting pattern since the previous elections. The Congress(I) gained in Vindhya Pradesh: its strength increased from 29 per cent votes and one seat in 1998 to 41 per cent and three seats. The increase is attributable to the shift in the BSP votebank. The BJP made gains in the tribal-dominated Chhattisgarh region; its vote share increased from 44 per cent in 1998 to 48 per cent, and it won eight seats, one more than in the previous elections. Neither party recorded a significant change in its position since the last Lok Sabha elections. But there was a turnaround from the November 1998 Assembly elections, with a five-percentage-point swing against the Congress(I). The Congress(I) in Madhya Pradesh enjoys more success in Assembly elections than in parliamentary elections – unusual for a party that prides itself on its national appeal.

Caste is not the be-all and end all of Madhya Pradesh politics.

The sample size for the State is 563. The sample over-estimates the vote share for the Congress(I) and under-estimates the vote share for the BJP.

Neither the BJP nor the Congress(I) displays the kind of sharp division of social profiles that is seen elsewhere in the country, and more specifically seen when the two parties are in direct competition with each other. In Madhya Pradesh they are both essentially "catch-all" parties. However, the usual bias persists to a small extent. The BJP enjoys a moderate lead among the numerically large segments of the upper castes and the Other Backward Classes, whereas the Congress(I) enjoys more substantial support among the numerically smaller segments – the Scheduled Castes, the Scheduled Tribes and Muslims. The BSP was relegated to a position of winning considerably reduced support from the S.Cs; it did not receive any noticeable backing from the other communities. Although the BJP fared well in the reserved S.T. constituencies (the reason for this is not that it enjoys the support of the majority of tribal voters), the CSDS survey reveals that it polled only 25 per cent of the S.T. vote. It appears that the votes of non-tribal people in the tribal constituencies have shifted to the BJP. ■

Swing in Jat vote

CSDS Team

DESPITE a good showing in the last Lok Sabha and Assembly elections, the Congress (I) suffered a major setback in Rajasthan this time. Its tally of seats dropped from 18 to nine, while the BJP increased its tally from five to 16. The result could have been worse for the Congress (I). It actually lost 11 seats, but the deficit was reduced as Buta Singh and Shiesh Ram Ola, who had joined its fold, won their respective constituencies.

However, in terms of vote share the Congress (I) was only slightly behind the BJP. And this result thus follows the trend of the last few closely fought elections. The Congress(I) maintained its vote share, but on account of the gains made by the BJP it suffered a five-percentage-point negative swing.

The BJP made gains across the State, picking up seats in every region. The major gains came in the Jat belt in the eastern and western regions, where it won five and two seats respectively.

The standard community and class profiles prevail in the State as they do elsewhere. However, they are evident to a lesser extent than in Gujarat and to a greater extent than in Madhya Pradesh. In the 1998 Lok Sabha elections, the Jat community was the only upper caste that went against the general pattern of support for the BJP and voted for the Congress (I). However, Jats were dissatisfied with the Congress(I)'s reservation policy. They switched to the BJP in large numbers, and this represented a 40-percentage-point swing against the Congress (I). The OBCs were divided in their support – by and large the Gujjars favoured the Congress (I), but other sections of the OBCs preferred the BJP. The Scheduled Tribes were also split, but the Congress(I) enjoyed strong support among the tribal communities and Muslims.

Rajasthan is unusual for perhaps being the only State in India where there is no gender difference in voting behaviour. While nationally the Cong-ress(I) is usually more popular among women and the BJP among men, this pattern did not hold in Rajasthan. ■

One-sided contest

CSDS Team

THE Bharatiya Janata Party Biju Janata Dal alliance tightened its hold on Orissa in a largely one sided electoral tussle It won 19 of the 21 seats, three up from its 1998 tally of 16 However, this does not reflect the full extent of the BJP-BJD s dominance in terms of vote share In 1998 there was a difference of almost eight percentage points between the Congress (I) (41 per cent) and the BJP-BJD (48 7 per cent) This year the difference between the Congress(I) (37 7 per cent) and the BJP-BJD (57 6 per cent) rose sharply to 20 percentage points

The dominance of the BJP-BJD was manifest in all regions of the State The BJD won eight and the BJP two of the 11 seats in the coastal region The Congress(I) won the remaining seat, two lower than the seats it won in 1998 The BJP-BJD made a clean sweep in western Orissa, a BJP stronghold Of the six seats in this region, five went to the BJP and one to the BJD Of the four seats in south Orissa, the BJP won two, the BJD one and the Congress (I) one

The BJP-BJD combine clearly enjoyed overwhelming support among the upper castes It fared considerably better than the Congress (I) among the Other Backward Classes However, the Congress (I) still enjoys considerable support among the Scheduled Castes There is growing support for the BJP-BJD among tribal communities, which were strong supporters of the Congress(I) at one time The proportion of the tribal population is higher in Orissa than in most other States

An interesting feature of the class profile in Orissa is that there is not much to distinguish among the top three groups as all of them overwhelmingly supported the BJP-BJD (about 60 per cent) over the Congress (I) (about 30 per cent) A different picture emerges among the 'very low' classes, which showed a greater level of support for the Congress (I) It is significant that the Congress(I), despite its electoral defeat, enjoys a higher degree of support among the poorest sections The difference in preferences does not show a graded pattern but a sharp distinction between the have-nots and the rest

Despite the horrendous incident in which the Australian missionary Graham Staines and his two young sons were burnt alive, the CSDS survey reveals that the percentage of the electorate in Orissa which thinks that injustice had been done to Christians is only marginally different than the all-India average This crime, which was allegedly committed by a person with links to the Sangh Parivar, did not prove electorally costly for the BJP In fact, the BJP candidate won in the very constituency in which the incident took place

With Assembly elections coming up in the state, the BJP BJD is placed in a very strong position The Congress(I) unit in Orissa seems to be in disarray organisationally even though the Congress high command replaced J B Patnaik with Giridhar Gamang as Chief Minister

The more interesting question before the Assembly elections will be the balance of power between the BJP and the BJD Will the latter succeed in sustaining itself as a viable regional party or is it likely to succumb to the BJP? ■

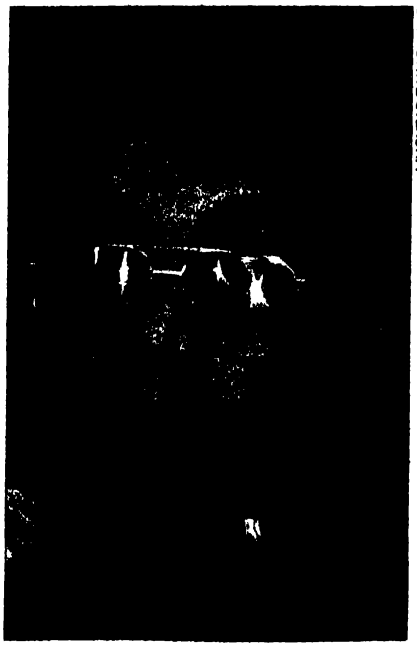
A new style in Indonesia

Indonesia is preparing to bury the ghosts of the past and energise its political and economic spheres under the shrewd leadership of President Abdurrahman Wahid.



P. S. SURYANARAYANA
in Singapore

A NON-ARCHETYPAL leader for an unusual situation – this sums up the style and substance of Indonesia's new President, Abdurrahman Wahid. In October, within hours of being elected President of the most populous South-East Asian country and the world's largest Muslim-majority nation, Wahid won over to his side the most popular Indonesian political leader, the charismatic but somewhat mercurial Megawati Sukarnoputri. Wahid not only got the designated electoral college to elect her Vice-President but consulted her on key appointments.

The political crisis in Indonesia that preceded the emergence of Wahid as chief executive and Megawati as the populist face of the new government was related in one way or the other to the role the military (TNI in local parlance) played in political affairs. The unpopularity of the TNI among both the elite and the masses, despite Army Chief General Wiranto's conspicuous efforts to be a democracy-friendly sentinel of stability, had left Wahid with no choice but to delink the armed forces from the levers of governance without, however, offending them. Wahid then appointed General Wiranto the highest-ranking Minister in his Cabinet and awarded him the portfolio of Politics and Security.

A few other serving military officers too were nominated to Cabinet positions, including the charge of the critical Internal Affairs Ministry, but there was not a murmur of protest from the country's neophyte democrats. The simple reason was that Wahid had signalled in no uncertain terms that he would be the real executive, aided by and discussing with key minister-consultants, despite his poor eyesight. (In mid-November, a United States-based plastic eye surgeon, B.C.K. Patel, certified that Wahid was responding well to treatment of the one eye that was functioning partially following its reconstruction. Wahid, affectionately known to millions of Indonesians as Gus Dur or Elder Brother, suffered vision damage as a result of a stroke a few years ago.)

Determined to stamp civilian authority irrevocably on all echelons of government, Wahid nominated a non-military academic, Juwono Sudarsono, as the new Defence Minister, after making sure that he would be acceptable to the TNI on account of his earlier association with it as a strategic thinker. For the first time in the history of independent Indonesia – which had been for long a presumptive national "model" of political cohabitation between the military leadership and the civilian elite – Wahid appointed a naval officer, Admiral Widodo, instead of an Army commander, the TNI's helmsman. While doing so, the new President outlined a policy to modernise and expand Indonesia's Navy, a largerly neglected wing of the TNI despite being

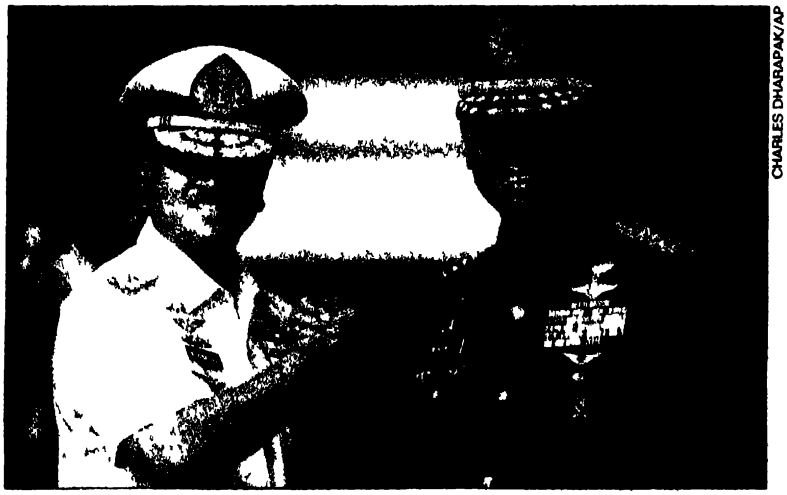
Economics Minister Kwik Kian Gie. His appointment put at rest the clamour for national reconciliation with Indonesian-Chinese.

the largest armed maritime force in South-East Asia. His reasoning was that Indonesia had for long remained vulnerable at sea despite being the world's largest archipelago-state.



Even while taking steps to ensure the security of Indonesia's frontiers as well as peace within, by giving the TNI's past and present leadership a new niche in society without militarising politics unlike in the past, Wahid turned his focus on ways to reverse the meltdown of Indonesia's economy and give it a new structural solidity. Towards this end, he appointed an ethnic-Chinese-Indonesian, Kwik Kian Gie, a close political associate of Megawati, the Economics Minister atop a pyramid of interlinked positions. Given the dominant role that Indonesian-Chinese people have traditionally played in the country's economic sphere, despite their minority status, and also the scars of a rampage against them at the height of the popular uprising against General Suharto's long reign in April-May 1998, Wahid's choice of Kwik made much sense to the international donors, also in the light of a clamour for national reconciliation.

In another unorthodox move, Wahid invited Lee Kuan Yew, Senior Minister and an elder statesman of Singapore (which is almost a synonym for a singularly economics-state with little or no political diversions), to suggest ways of putting Indonesia through a financial recovery. With Lee agreeing to serve as an international expert, Wahid's task of convincing international investors about Indonesia's emerging status as a safe destination for their capital became somewhat easy. (The economic success story of Singapore was not affected by the recent financial crisis in the region.)

Acehnese youth take part in a rally in Sigli demanding a referendum on the issue of independence for the province.

CHARLES DHARAPAK/AP

Former Armed Forces chief Gen. Wiranto (right) with his successor Admiral Laksamana Widodo during an official ceremony to hand over his post, in Jakarta on November 4.

Unlike Malaysia's Mahathir Mohamad, who engineered an economic recovery in his recession-hit country without turning to the International Monetary Fund (IMF) and other global financial wizards for help, Wahid endeared himself to the gurus of the capitalist market by endorsing "profit motive" and "free trade" as also other mantras of the new breed of global capitalists who talk of doing "business at the speed of thought".

FOR an Islamist-cleric with faith in Western-style conservative capitalist beliefs, Wahid stunned Indonesian and international observers alike by espousing near-revolutionary political ideas. He announced a policy option of allowing the restive people of the Indonesian province of Aceh, bordering the eastern flank of India's maritime boundary, to decide their political future in a referendum within seven months from mid-November. Of somewhat undefined scope, the referendum would be fashioned according to the wishes of the Acehnese.

In Wahid's reasoning, there would be nothing amiss in holding a plebiscite in Aceh, a radical Islamist outpost of Indonesia founded on "Pancasila" or the five principles of jus-

A diplomatic initiative

P. S. SURYANARAYANA

NOT since the Asian-African Conference in Bandung in 1955 has a diplomatic initiative by Indonesia attracted as much international attention as the latest call by President Abdurrahman Wahid for the creation of a five-power entity consisting of China, India, Japan, Singapore and Indonesia. In calling for such an informal grouping while addressing international businesspersons in Singapore on November 6, Wahid took great care to emphasise that he did not have in mind the notion of a strategic bloc of any kind.

If, however, the proposal caught the attention of the United States, as noted by some Western as also South-East Asian diplomats, the reason had much to do with Wahid's conspicuous omission of Washington in outlining the entity. In Wahid's calculus, these five Asian countries could cooperate with one another in the context of Indonesia's current quest for economic linkages. He wanted Jakarta to improve its ecomomic ties with India and China, and in his view Singapore and Japan could in some way help this process along.

While Wahid's proposal did not induce any of the countries he mentioned to revise their respective diplomatic calculations, Singapore Prime Minister Goh Chok Tong said he did not get the impression that Wahid really wanted to keep the U.S. out of Asia. The comment acquired importance in the context of the conventional wisdom in South-East Asia that Washington's strengths constitute the critical mass of the region's political-strategic stability.

Western diplomatic circles surmise, behind the scenes, that the "entity" in Wahid's freelance foreign policy initiative, can at best be seen as a matrix of Indonesia's separate bilateral ties with each of the other four Asian countries in focus. In that sense, the criss-crossing areas of overlap, if any, would give them the appearance of an entity. While the idea did not, therefore, set the Pacific and the Indian Oceans on fire, it made the U.S. take note of Wahid.

There was another reason, too. Wahid expressed the hope that India and China would reciprocate his sentiments because he thought that "they believe in non-hegemonic foreign policy (and) trade policy". Sensing that this might be construed as a plea for a new zero-sum game between a definitive Asian entity and the U.S.-led West in a milieu of anticipatory "multipolarity", he made it clear that he was no less interested in keeping Indonesia's ties with the U.S. in good repair.

Wahid's choice of New Delhi as a potential player on a wider Asian plane in the present circumstances can be understood in the light of his high praise for Gandhiji's secularism as a guiding principle and for India's human resources in science and technology. Otherwise, India has hardly ever figured in Indonesia's strategic considerations except for a singular instance in the past over the expansion of India's naval prowess.

As an archipelago-state, Indonesia is acutely aware of Alfred Mahan's theory about the relevance of sea power in international commerce and politics. While Wahid has, therefore, advocated a strong navy for Indonesia, his overall initial diplomatic initiatives in inter-state regionalism are anchored in the belief that security can be attained by ensuring "national resilience" on the basis of a sound economy at home and later "regional resilience" on the basis of the shared economic interests of a group of states. ■

tice and secularism. To justify the decisions, he cited the precedent of the referendum held in August this year in the predominantly Roman Catholic half-island of East Timor which, in the event, opted to sever links with Indonesia.

Many military and political leaders in the country, including Wiranto, and also international analysts were aghast at this parallel. East Timor had never been recognised by the United Nations as an integral part of Indonesia despite the latter's annexation of that island in the mid-1970s. Aceh, on the other hand, has been a part of Indonesia since its independence from the Dutch imperialists. In his calculation, the radical Islamist separatists of Aceh will only opt to stay with Indonesia. In that sense, he wanted to take a political risk by striving for an Acehnese vote for Indonesia in order to ease the trauma of Jakarta caused by the loss of East Timor.

Many Western and some South-East Asian diplomats see this as a political drama fraught with uncertainties. While Wahid's conservative economics drew praise from them, his unorthodox politics left them somewhat uncomfortable. But there simply was no doubting the arrival of an authentic Indonesian leader on the regional stage, whatever be the international reaction to Wahid's comfort level with the legacies of Adam Smith's economics at one level and the Wilsonian self-determination in politics at another.

IN the first flush of nationalist anger over the suspected Western game plan of delinking East Timor from Indonesia, Wahid sought to visualise a new foreign policy with an Asiatic core. He struck a rapport with some Asian countries in this regard but his action alerted the West, in particular the U.S. Not surprisingly, it soon gave Wahid a chance to call on President Bill Clinton in Washington. Clinton supported the current democratic transformation across Indonesia but left it to the Indonesians to decide questions relating to a possible trial of and probable clemency for Suharto in respect of the corrupt deeds he allegedly committed during his three-decade-long authoritarian rule.

Central to Indonesian-U.S. relations is the issue of bilateral military cooperation, which was suspended at the height of the East Timor crisis on the eve of the arrival there of a U.N.-mandated multinational force. Clinton and Wahid left open the possibility of future interaction in this sphere in certain circumstances. Wahid agreed to U.S. assistance in the form of non-official conflict-resolution expertise in regard to a clarification of issues in Aceh.

In the domestic sphere, Wahid sparked suspicions among hard-core Islamists when he proposed the establishment of commercial ties between Indonesia and Israel. Even as protests grew over the Israel issue, Wahid was engrossed in visualising creative ways to conduct the country's foreign policy. His latest initiative, which held the field at the end of his economic-aid-seeking mission to Japan on November 16, has been to invoke China, India, Japan and Singapore to link arms with Indonesia in order to create a five-power entity. ■

Elusive settlement

Will the Israelis and the Palestinians achieve a breakthrough on the questions of settlements and refugees before the February deadline for a Framework Agreement?

KESAVA MENON
in Bahrain

THE Palestinians and the Israelis fire rhetorical barrages at each other almost on a daily basis. Negotiators representing the two sides meet and discuss apparently in cordial fashion with the same frequency. The mixed signals are appropriate for the most crucial phase yet in the Israeli-Palestinian interaction.

By mid-November, Israel was readying itself to complete the second of the three troop redeployments promised in the Wye II accord signed in the Egyptian resort of Sharam al Sheikh on September 4. A first troop redeployment had taken place, as promised, within a week of the agreement being signed. Although there was a dispute over the territory in respect of which the second redeployment was to take place, it seemed safe enough to predict that this would eventually be carried out perhaps a few days after the mid-November deadline. The third redeployment, the final one in the ongoing "interim stage" of the Oslo-directed interaction between the two sides, is to take place in January.

With the completion of troop redeployments, the Palestinian Authority will exercise control over civil affairs in 40 per cent of the West Bank. It will also be in charge of security affairs in a part of the 40 per cent of the West Bank, while Israel will retain an overall supervisory role in respect of security affairs in the remaining area. Sixty per cent of the West Bank will remain under full Israeli control in respect of civil and security matters. No changes have taken place in the Gaza Strip since the Gaza first phase was implemented four years ago. The Palestinian Authority is in charge over most of this slice of territory, but a few Israeli settlements remain and Israel controls security in the vicinity of, and on the approaches to, them.

In signing the Wye II agreement, Israel reconfirmed the plans to open a safe corridor between the Gaza Strip and the West Bank. More pertinently, it has finally opened a four-lane highway for traffic between these hitherto separated segments of the Palestinian patrimony. The Palestinians tried unsuccessfully to make the Israelis concede control over this safe passage, and finally the two sides agreed on a face-saving compromise. As per this compromise, the Israelis actually decide which Palestinians will be allowed to cross between Gaza and the West Bank, but Palestinian officials process the papers so that Palestinians do not have to apply for or get their travel permits directly from the Israelis.

Within the next few months the two sides are scheduled to firm up an agreement on the opening of a seaport in the Gaza Strip. If this deal does come through, then Palestinians, whether living in the Gaza Strip or the West Bank, will be able to ship their produce out without being dependent on the Israelis or the Jordanians. The seaport is likely to remain under some form of Israeli control like the airport that was opened earlier this year, but at least the delays and other forms of hafassment will be reduced. Theoretically it should be possible for international travellers coming by air or sea to disembark on Palestinian territory, travel through it and leave without touching Israeli soil, though it is unclear as to who has the authority to issue travel documents.

As a result of these developments, the Palestinian Authority will be equipped with many of the trappings of a sovereign state. Trappings of sovereignty, of course, do not make for the reality of it and the logic of circumstances is such that even the Authority recognises that it will not acquire full sovereign power even when its "permanent status" is fixed through agreements with Israel In this day and age when international treaties, and new doctrines, circumscribe the quantum of sovereignty available to almost any state, it could be debated whether Palestinian aspirations are not being unreasonably thwarted. But all said and done, the

Palestinian leader Yasser Arafat and Israeli Prime Minister Ehud Barak shake hands prior to bilateral talks in Oslo on November 2.

Palestinians are going to end up with a lesser quantum of sovereignty than what most other states enjoy.

The extent of sovereignty that they will eventually exercise is one of the key issues that the Palestinians will negotiate with Israel over the next few months. It might prove to be an easier one to resolve among the several issues that the two sides have to sort out as they try to fix the nature of the relationship they will have and maintain over the foreseeable future, that is, the permanent status of their relationship. Under the Wye II accord, the two sides were to negotiate the permanent status issues before the second troop redeployment got under way. They have more or less stuck to the schedule since the negotiating teams were nominated and have already held several rounds of discussions meeting alternatively in Israel and in Palestinian-controlled territory.

MICHAEL PROBST/ AP

U.S. President Bill Clinton at a memorial meeting for Yitzhak Rabin in Oslo. The late Israeli Prime Minister's picture is in the background.

In their efforts to create a state that will have near parity with Israel in the legal dimension (they will not have parity in real power terms for the foreseeable future), the Palestinians have to achieve a number of objectives. Besides the quantum of sovereignty, the Palestinians have to win back if not the whole at least a sizable portion of the territory that they claim on the basis of United Nations Resolution 242. They also have to win the right to decide how many people they will allow to settle in the territories that they will control. Some workable arrangement in respect of Jerusalem will also have to be arrived at because about 150,000 Arabs live there: the city provides the crucial physical link between the northern and southern portions of the West Bank and it is the heart of Palestinian's cultural, intellectual and spiritual existence. Several other matters, including a fair distribution of water resources, have to be negotiated as well.

Most of the issues to be negotiated in the permanent status phase of the Oslo processes are very difficult to resolve either because they are rooted in the vital interests of the two peoples or because they carry a lot of emotional baggage. It was Israel's Prime Minister Ehud Barak who suggested that the two sides work through a two-phase process for the final status negotiations. With this suggestion being accepted, the two sides are to try and strike a Framework Agreement by mid-February next year and seal the permanent status by September 2000. In the Framework Agreement, the two sides will – if the talks are most positive – set out the basis on which they will settle the permanent status issues. If the negotiations turn out to be far tougher, as they are expected to be, the two sides will try to mark out the issues they can settle by September and suggest a time-frame within which the rest can be sorted out.

Palestinian Authority President Yasser Arafat is accorded the protocol due to the head of a sovereign state whenever he makes a diplomatic excursion and his officials are treated like representatives of a full-fledged government. It is also more than likely that most countries will extend recognition to the Palestinian state if Arafat declares statehood in a reasonable and responsible context. Objective circumstances, however, will determine to a high degree what a reasonable and responsible context is. For instance, it is unlikely that many states would extend recognition if Arafat declares statehood before September, unless Israel indulges in gross bad faith. It is also unlikely that such recognition would be extended if an agreement is close but not clinched by September. Most important, the U.S. administration, on which the Authority has become dependent to a great extent, would not support a premature declaration of statehood.

In negotiating the quantum of sovereignty with Israel (as contrasted with the unilateral assumption of sovereignty through declaration), the Palestinians will have to take note of the "red lines" that Israel has drawn. Israel wants to restrict the Palestinian's treaty-making powers so that they do not make alliances with countries hostile to Israel. This might not be a serious problem in the immediate historical context since it is unlikely that the Palestinians would want to make an alliance with either Iraq or Iran, two countries that are intrinsically hostile to Israel. The same consideration is likely to apply in respect of the other Israeli conditions, that it will not allow the Palestinians to host a foreign army that is hostile to it (Israel) and that it will restrict the Palestinian's capacity to build their military strength because that might pose a threat to Israel's existence.

A recent statement by Arafat pertaining to the territories he hopes to regain possession of was significant for its omissions. In that statement, Arafat seemed to indicate that he had little hope of regaining those portions along the "Green Line" (the border between Israel and the West Bank after the 1948 armistice until the 1967 war) which Israel has built up as if it was its own territory. About 90 per cent of the Israelis in the West Bank live in this thickened "Green Line" and successive Israeli governments have indicated that they will not let go these areas of land. While this border is amenable to a conceivable compromise, the Palestinians will take a tougher negotiating position in respect of the 140 or so Jewish settlements in the West Bank.

Barak recently dropped a bombshell when he said that in his interpretation of the relevant U.N. resolution, Israel was not obliged to withdraw from all the Palestinian territory that it had captured in 1967. According to Barak, the resolution called on Israel to withdraw from "territories" occupied in 1967 and not "all the territories" occupied then. His argument was that the language of the resolution thereby permitted Israel not to return some of the territories. Secondly, Barak said, Israel was obliged to withdraw

only from territories captured from the sovereign states of Jordan and Egypt and that since Palestinians did not constitute a state at that time, Israel was not obliged to accord them the same treatment.

This statement was perhaps a gambit at the opening of the tough negotiations to come. However, Barak has also spoken of his deep attachment to the settlements because they exist in Israel's biblical heartland and because settler families have put in much effort to build their lives there. Also, a party which represents the settlers is a key component of Barak's government. In all these respects, Barak seems to be following a policy different from that of his mentor Yitzhak Rabin. By the time of his death, Rabin seemed ready to abandon the isolated settlements to their fate. He had not gone so far as to declare that he would negotiate these isolated settlements out of existence, but he seemed ready to declare that he would make no special security arrangements for them and that they would be left to take their chances as islands in a Palestinian sea. Barak does not appear prepared to go so far, though the pro-peace camp in Israel and a probable majority in his own Labour Party would treat this as the best outcome.

Far from declaring a disinterest in the West Bank settlements, leave alone any plans to dismantle them, Barak has not done enough to roll back settlements which are illegal even according to the Israeli rule book. In the lead-up to last May's elections, the then right-wing government in Israel encouraged settlers to set up new *avdouts* (facts on the ground) by throwing up outposts on adjacent hilltops. Since then about 40 such outposts had been set up, and though the Palestinians had demanded that all of them be demolished as a sign of Israeli good faith, Barak ordered the closure of only 12.

The Barak government has also not revoked the permits granted by the previous government for further construction activity in the existing settlements; instead, it has issued fresh permits. Successive governments in Tel Aviv have insisted that such construction is needed to take care of "natural growth". But pro-peace activists have presented proof that there has been over-building in the settlements and that many units are unoccupied. It is not just the land on which housing units stand that Palestinians lose in the process. Each of these settlements is connected to a communications network which bypasses Palestinian communities. Palestinians are thereby deprived of the lands on which the roads have been laid and security perimeters marked out.

With the settlements scattered all over the West Bank, the road network effectively slices up this land into so many disjointed pockets. Unless the settlements and road network are done away with, Palestinians will at best be left in possession of so many segregated cantons. If it is difficult to see how the Palestinians will be satisfied with such an arrangement, it is also difficult to see how they will get the Israelis to reverse the situation. The U.S. administration, which could possibly have made a major input, is unlikely to do so given its own domestic political compulsions.

EVEN if a workable compromise can be arrived at in respect of territory, it will not by itself resolve the further problem of the population which is to be allowed to use that territory. About five million Palestinians live in refugee camps in Jordan, Lebanon and the Gaza Strip, not to count others scattered all over the world. Since they are classified as refugees they are entitled to return to the lands from which they were ousted, which means to sites that are now part of Israel. But it is inconceivable that Israel can be persuaded to allow the Palestinian refugees to return to Israel proper. It has taken a tough position on allowing the refugees to return even to the territories that it will hand over to the Palestinian Authority.

Given the limited natural resources available in the Gaza Strip and the West Bank, there is an outer limit to the number of people who can be allowed to live there. It is also conceivable that some among the refugees will want to remain in the countries where they live now. But these considerations hardly mitigate the dimensions of this huge human problem since the host countries do not want the Palestinian refugees to remain on their land forever and Israel does not want them to return to their homes.

Moreover, at least two generations have been born since the Palestinians were first driven out of their homes and the dispute over how these descendants should be classified has not even been addressed. Israel has suggested a solution whereby these refugees would be given citizenship in the countries where they currently live, with generous financial help from the international community to them and their host governments. Since Israel's negotiations with Lebanon and Syria have hardly progressed, this suggestion hangs in the air.

While the above issues are driven by hard factual considerations, it is difficult for any outside observer even to begin to understand Israel's adamant stance on Palestinian's right to East Jerusalem. One fear, which Israel often cites in support of its argument, is that the Palestinians might block their access to holy sites in and around the Walled City if East Jerusalem were to be handed over to them. Since the Walled City contains Christian as well as Jewish sites (as also Muslim) and since international opinion will no longer countenance cultural vandalism, it is inconceivable that the Palestinians would be able to get away with blocking pilgrims from reaching their shrines.

Even if Israel wanted to retain control over the sites in and around the Walled City, it can probably be done without retaining control over the rest of East Jerusalem. The Walled City, the Mount of Olives (including the Jewish cemetery on it) and so on are close upon the borders of West Jerusalem and can probably be detached from the rest of the city without much of a problem. The facts that Israel cannot wish away are that a large population of Arabs (many representing the social heart of the Palestinian community) lives in East Jerusalem; the city provides the transportation hub between the two portions of the kidney-shaped West Bank; major educational and medical institutions are located there; and it is just as difficult for Palestinians to conceive of their state without a part of Jerusalem for its capital as it is for Israelis.

This is basically an emotional issue for the Israelis and as such it can possibly be finessed. There is a proposal to declare Abu Dis, a suburban village to the north-east of the city, as a part of Jerusalem. Palestinians would be allowed to establish the centre of their administration in Abu Dis, Arab-populated wards of Jerusalem would be attached to the control of the Abu Dis centre, and this newly created entity could be called Al Quds (the Arab name for Jerusalem) and accorded the status of national capital.

As the Israelis and the Palestinians race towards the February deadline for a Framework Agreement, the prospects look bleak for any breakthrough on the questions of settlements and refugees. The prospects for statehood in limited form appear to be the brightest while at least some creative thought is being applied to the question of Jerusalem. ■

Shades of green

Will Europe's Green parties continue their ascent to power and serve as an effective check on governments or will they be swallowed up as the Green agenda is all but hijacked by other political parties today?

SHIRAZ SIDHVA
in Paris

WHAT happens when the environmentally passionate idealists and anti-nuclear pacifists of the world are faced with realpolitik? They learn very quickly that they have to water down their idealism in order to accommodate to the rough and tumble of being in government.

That is precisely what Europe's Green parties are experiencing, as more and more of them cross over from the ranks of the Opposition to participate in government. Gone are the days when the Greens were flower-children or flag-waving libertarians who preached vegetarianism and pacifism. Today, they have found common cause with the Centre-Left, which is back in power in more than a dozen of the European Union's 15 member-states. The Green parties are increasingly setting the tone at the national level, sharing power at the highest level, notably in Germany, France, Italy, Belgium and Finland. There are 47 members of the Green group in the European Parliament, an increase of 20 members from the previous one. The Greens have increased their strength in elections in France, Britain, the Netherlands, Finland, Austria, Ireland and even Spain, where their presence was negligible in earlier parliamentary elections.

As Europe's free-marketeers make way for Social Democrats across the board, there is a growing acceptance of the fact that economic growth can be achieved without sacrificing socialist values. Nowhere is this trend more apparent than in France, where Lionel Jospin's government is arguably the most popular in Europe. The French economy is in splendid shape, and though the rate of unemployment remains higher than that in Germany, where the economy is faltering, the figure is at its lowest in six years.

Taking some of the credit for nudging Europe towards this new socialism are the Green parties. Born out of the pacifist and environmentalist movements of the 1970s, these 'alternative' parties now have to deal with the reality that they are in the mainstream. While most governments predictably end up allocating only the Environment Ministries to Green party members, as in France, Italy, and Finland (this is not necessarily a bad thing, though limiting), Germany actually has a Green as Foreign Minister, one of three Greens in Chancellor Gerhard Schroeder's Red-Green coalition.

THE transition from the fringes of politics to centrestage has not been easy for the Green parties. There has been much soul-searching among the party's original leadership, and the Greens themselves have had to change to adjust to the new situation. Nobody could have realised this more acutely than Joseph (Joschka) Martin Fischer, Germany's popular Foreign Minister. The former factory worker and taxi driver, whose Green ideology was honed by the anti-War protests of the 1970s, was confronted with a major test earlier this year. As Foreign Minister, Fischer had to break away from the natural habitat of the Green politician. He has had to abandon his scruffy jeans and his resolve never to sport a tie.

Gone are the days when the Greens were flower-children or flag-waving libertarians who preached vegetarianism and pacifism. Today, they have found common cause with the Centre-Left, which is back in power in more than a dozen of the E.U.'s 15 member-states.

In May this year, Fischer faced the unenviable task of persuading the diehard Greens in his party to back off from their decision to withdraw support to the government following the Kosovo bombings. He passed the test: his colleagues grudgingly conceded that it was better to stay in power, even at the cost of compromising with their loftiest principle of pacifism.

Barely a year in office as the junior coalition partner of the Social Democrats led by Schroeder, Germany's Greens have found that sharing power at the highest level has its own peculiar problems. The electoral setbacks suffered by Schroeder recently may have masked the disarray in the leadership of the Greens, but members admit that many of the party's policies are outdated and need serious reform. "Our leadership is weak, our membership divided, and our organisation uncohesive," said a senior Green party leader attending a seminar in Paris. "We have to rethink our role," she said. "It is not enough to have power - we have to be able to use that position to achieve our goals."

Although they are arguably the most influential Green party in Europe, the German party's morale has tumbled with the dwindling electoral fortunes of the Social Democrats. Old-timers in the party fear that it is fast losing the identity it painstakingly cultivated from the 1970s. Some leaders complain that the party had to share the blame for some of Schroeder's unpopular economic and social reforms, which, in fact, it actually supported. And although it has threatened to leave the coalition time and again, it is for the first time in the party's history that it has tasted power. "We may be worse off if we split up with the Social Democrats at this point," said the Green party leader, who asked not to be named. "It is better to stay in power and make ourselves heard."

While Schroeder relies on the Greens to stay in power, their troubles would not be over if they were to go it alone. According to psephologists, the Green party's share of the national vote has plummeted from 10 per cent in 1997 to only 5 per cent now, the threshold below which parties are not entitled to seats in State or national parliaments.

THE Greens of France have less clout than their German counterparts. Jospin leans less heavily on Les Verts (The Greens, the French party's official name) to stay in power, and there is only one Green Minister, Environment Minister Dominique Voynet, in his Cabinet. And yet the party has remained as vocal as it can get in the circumstances, and has threatened to withdraw support whenever the government stepped out of line on issues that are important to the Greens.

There have been tensions ever since the French Greens first tasted power when Jospin included them in his government in June 1997. At a special summer session in the end of August, the Greens gave vent to their spleen as Jospin vacationed on a small island off the Atlantic coast. They felt cheated that they were given only a single position in the Ministry though they won nearly 10 per cent of the vote in the European elections in June They scored better than the Communists, the second largest group in government, who have three Ministers. Yet, their pleas for increased ministerial representation have fallen on deaf ears.

But more central to their concerns is the nuclear issue and the way the French Government disposes of nuclear waste. "We are more concerned about the lack of response to our demands on the nuclear energy issue than about representation in the Cabinet," insists Yves Cochet, a prominent leader of Les Verts and a Vice-President of the Assemblee Nationale, the French Parliament. "We know that our influence in France is greater in proportional terms than the number of seats we have in Parliament. And though our influence in the government is not as much as we would desire, we manage to give it some orientation."

According to Cochet, having a Green Environment Minister has made all the difference to the country's waste management and recycling policies. The Greens, along with the Socialists and the Communists, have been pushing for a 35-hour work week and have had their way, though Jospin might rightly want to claim credit for it. The bold experiment may not be the cure for the unemployment problem (there are nearly three million unemployed persons in France), but it may provide a way to restructure the French workplace and introduce productivity and flexibility without inducing social unrest that is characteristic of France.

But the Greens are angry that they were ignored on vital issues inside the ruling coalition. They are particularly concerned about the development of the next generation of nuclear power stations, the European Pressurised Reactors (EPRs). France's 56 nuclear reactors (one has been closed down) provide 78 per cent of the country's energy, one of the highest rates of nuclear dependence in the world. As these reactors become obsolete, France will be faced with the choice of scrapping them and depending on other sources of energy, or replacing them with a new type of reactor.

One concern of Green political analysts is that environmentalism has remained the preoccupation of the rich. Despite the spread of Green parties across Europe, they dominate mostly the more prosperous, industrialised north.

The EPR project, which the Greens are fighting, is a Franco-German joint venture, to be constructed by Germany's Siemens and France's Framatome, and will start operation by 2010. "The nuclear lobby in this country is very powerful, but we will fight it every inch of the way, " said Denis Baupin, the Green party spokesman. "This is one issue we cannot possibly compromise on, and a very fundamental one for the party," Baupin added.

The Greens want France to follow the example of Belgium and Germany, which have opted out of nuclear power. Les Verts sees this issue as the red line that it cannot possibly allow the Government to cross and still share power. "If the decision is to build new plants, we will be forced to pull out," Baupin said. The Greens are angry that Jospin's sole gesture to placate them was to freeze the construction of new nuclear plants.

Another issue that the Greens are at loggerheads with the government is about the *sans papier* (without papers)or the legalisation of over 60,000 illegal immigrants in France, who entered the country without their papers in order. While the Greens believe the immigrants should be legalised and allowed to remain in the country, the government has proclaimed that it is "out of the question". Voynet already clashed with the Prime Minister last year on the issue of amnesty to these immigrants. She renewed her attack on the government in mid-November. Immigration is a highly emotive issue in the country, with the Right parties predictably taking the hard line, and the Left rooting for the legalisation of these "paperless" people.

The French Greens have also been vociferous in their support of farmers who have been campaigning against McDonald's fast food outlets and the sanctions slapped on French luxury foods by the United States in retaliation to Europe's refusal to allow the import of meat from hormone-treated animals from the U.S.

Cochet is confident that being in government does not mean eschewing the idealism associated with the Greens. "One leg is in government, the other leg is in society," he says. "We have real contact with real people, and we cannot disconnect from that. And being in government means we have to take some responsibility for the decisions being taken there."

The Greens lay great stress on the power of the people to change things, and may prove more successful in local politics than in the national arena, although it is too early to tell, given that their involvement in national politics is too recent. Residents of a remote mountain village in Tuscany, Italy, are battling against the construction of high-voltage power lines that threaten the historic landscapes where little has changed since the time of Michelangelo and Dante. Edo Ronchi, the Green Environment Minister, is being forced to propose new legislation to protect these landscapes. "The Greens have a history of making a difference," says Fabio Roggiolani, the Green party spokesman in Tuscany.

CAN Europe's Greens really change their world? Will they continue their

ascent to power and serve as an effective check on governments, or will they be swallowed up, as the Green agenda is all but hijacked by other political parties today? Most mainstream political parties, whether Left or Right of Centre, agree that the environment needs to be protected The Green doctrine has lost its rebellious character and is becoming almost boringly conventional Transport Minister Isabelle Durant, one of two Green Ministers in the Belgian government, aptly terms it the "banalisation" of green politics

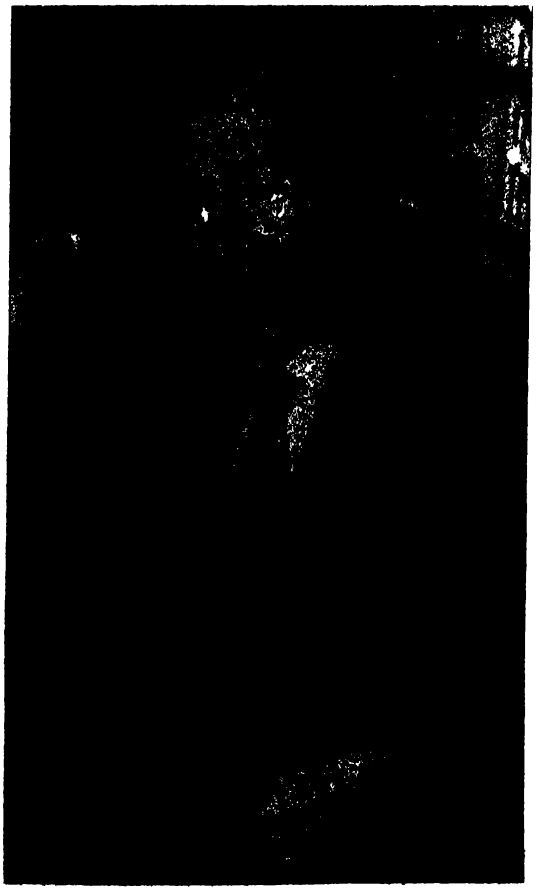
The goals of the Greens are based on the symbiosis between man and nature, individual freedom and equality, nonviolence and civil democracy But many parties respect these values today and accept the fact that the transition must be made to a humane and ecologically sound society The Green bywords of 'responsibility for the planet, solidarity, and citizenship", their fight against nuclear power to protect the environment, and their concerns about balancing the rela tionship between the world's rich and poor nations, with a redistribution of work and wealth, are no longer issues that are unique to the Greens

This has meant that the Greens in some countries have been left out of power, with nothing to distinguish them from their counterparts in the socialist or other leftist parties In Norway for instance, the socialist Left has taken over the environmental vote, leaving the Greens without much support For some Greens, this is a vindication of what they have always fought for "It's not just us crazy Greens anymore who are worried about issues such as global warming and genetically modified foods,' says Jacques Clement, a long-time Green party supporter "As long as we have made people aware of issues that matter to us, our battle is won "

Another concern of Green political analysts is that environmentalism has remained the preoccupation of the rich. Despite the spread of Green parties across Europe, they dominate mostly the more prosperous, industrialised north and have hardly any backing in countries such as Greece or in southern Italy, or even in Eastern Europe, where environmental concerns have been given short shrift in the years of communism.

And yet, there is hope. Small Green parties have mushroomed across the former eastern bloc as well and will some day take root and be forces to contend with, like their counterparts in the west. ■

The end of a trial



Former Italian Prime Minister Giulio Andreotti has been acquitted of the charge of Mafia links, but the chances of a return to power of his Christian Democratic Party appear slim.

BISWAJIT CHOUDHURY

THE end of autumn brought deliverance for the 80-year-old Giulio Andreotti, former Prime Minister of Italy After seven years of trial, on charges of association with organised crime and collusion with Mafia clans, Andreotti was acquitted by the court at Palermo, Sicily The judges found Andreotti not guilty because the "facts do not exist" A month earlier, a court in Perugia had acquitted him of the charge of ordering the murder in 1979 of Mino Pecorelli, a journalist, who the prosecution had contended was about to publish damaging information concerning Andreotti

'I am always the same me," Andreotti jokingly told photo journalists after the verdict It was also a reminder of the way in which he had borne himself through the years of trial submitting to the courts to display his respect for the justice system It is difficult however, to imagine that the political credibility of Andreotti has been restored, because it was not he alone but a whole class of political leaders that was swept away in the dramatic changes in Italy at the turn of the 1990s.

When instances of large-scale corruption by politicians were exposed by what came to be called in Italy as the judicial revolution", Andreotti s own trial being a part of it the political parties that were the most affected were the Christian Democrats (D C) of Andreotti and the Socialists both of which, in alliance, had almost uninterruptedly dominated Italian politics for over 25 years until they were decisively rejected by the electorate in 1993 Another accused, former Socialist Prime Minister Bettino Craxi, lives in Tunisia as a fugitive from trial in Italy

ANDREW MEDICHINI AP

Giulio Andreotti in Rome on October 23 after a court in Palermo, Sicily, acquitted him of charges of colluding with Mafia clans.

ANDREOTTI was one of the most influential politicians during the entire period of the First Republic, which was installed after the War and which ended with the eclipse of the old political elite in the 1990s He led seven governments as Prime Minister and was a Minister in several others before the Christian Democrats crumbled under a crisis of credibility and mass disenchantment The system had endured for almost half a century with a succession of 50-odd governments

What was unique about the Christian Democrats of Italy in comparison with any political party in Western Europe was that it remained the dominant partner in every one of these governments. The Communist Party, the second largest political party after the Christian Democrats, had 30 to 33 per cent of the vote share but remained permanently in the Opposition as a casualty of the extraordinary stability of the system. The one-party dominance resulted in a high degree of fusion between the party and the state, which in turn ensured the permanence of Christian Democrat power.

The murky consequences of this long relationship – patronage, systematic corruption through high public office, links with the Mafia, all of which collectively came to be known as "Tangentopoli" or "Bribestown" – began to unravel in the 1990s when the judicial revolution gave the final push to bring down the party and end the era of the First Republic.

Former Communists, who head a government for the first time in their new manifestation as the Left Democrats, have defended the judges and their drive against corruption and the Mafia.

Andreotti was something of a symbol of the permanence in power of the Christian Democrats. Through his continued presence in successive governments, his familiar image among those in power was one of a reminder that nothing changed. In this sense, the story of the trial of Andreotti would read like a part of the history of post-War Italy, particularly of the turbulent years of the 1970s when he was thrice at the helm of government.

The 1970s were the years of the student and trade union movements, of savage leftwing and rightwing terrorism. It was also the time when the Communists nearly broke the barrier of government through the 'historic compromise' with the D.C. Enrico Berlinguer, the Communist Party secretary, proposed a new political alliance with the D.C. to meet the crisis created by the protests, the terrorism and an economic recession. He was particularly concerned about the dangers of an authoritarian reaction that was evident in the 'strategy of tension' employed by the extreme Right sometimes with the covert involvement of members of the secret services, to set off bombs in public places in order to sow panic and create the conditions that are conducive to an authoritarian regime.

The guiding spirit of the 'historic compromise' among the Christian Democrats was the dynamic strategist Aldo Moro. His kidnap and murder by the Red Brigades in 1978 was the most telling blow dealt by terrorism. While the full truth about Moro's assassination has not come to light, the documents that Pecorelli, the murdered journalist, had threatened to publish were allegedly about the Moro affair. The Communists finally did not join the government but they had saved the democratic state. In the shadowy world that had threatened democracy, leftwing and rightwing terror and the Mafia seemed to have come together. The charges against Andreotti mention instances when the Mafia and the Red Brigades were said to be in contact with each other.

The greatest danger to the authority of the state had come from the Mafia. From its origins in rural Sicily last century, the Mafia has adapted well and grown to become a state within a state. It has a record of eliminating those who have pursued it, as is evident from the murder of two anti-Mafia judges, Falcone and Borsellino, in the early 1990s and of General Dalla Chiesa, who was in charge of anti-Mafia operations in Sicily.

An Italian institute of social studies, CENSIS, has estimated that between 12 and 15 per cent of the country's gross domestic product (GDP) comes from criminal activity. The Mafia and its counterparts, the Camorra in Naples and the 'Ndrangheta in Calabria, have spread their influence in the civil society of south Italy and diversified into sectors such as the building industry.

The case against Andreotti was that during his regime the Mafia had penetrated right up to the very top, and that he had met clan bosses such as Santapaola and Toto Riina. Although the real links between the Mafia and political power have never been allowed to emerge, years of anti-Mafia investigations have established how collusion between the Mafia and the administration worked at the intermediary level of local leaders, who were themselves part of the factions at the national level. Salvo Lima, the Christian Democrat party secretary at Palermo who was killed by the Mafia in 1992, was said to be Andreotti's link with the Sicilian clans.

The pattern of clientelism that the Christian Democrats managed to institutionalise in southern Italy operated in the Mafia's case in the form of lucrative contracts awarded from state resources for the development of the south, and the Mafia's help to ensure that the turnout of voters in favour of the Christian Democrats. No receipts were given, nor were documents signed, for the Mafia is a secret society. In the local tradition it does not have a name but is referred to simply as the Cosa Nostra, meaning "our affair". Its members are called 'men of honour', and transgressing the rules of silence means death. In recent years the state's campaign against the Cosa Nostra has been aided by the testimonies of the *pentiti* (repentants), former men of honour who could testify to the Mafia's secret structures. In fact, the major burden of proof against Andreotti rested on the testimony of former mafia boss Tommaso Buscetta.

Now that the courts have not accepted the testimony as sufficient evidence, there is a clamour by politicians not only against the *pentiti* but against the judges whose work has contributed much to Italy's recent political transformations. The Leader of the Opposition, former Prime Minister Silvio Berlusconi, said: "The verdict has to signal the beginning of the end of the season of judicial revolution that has intervened like a cancer into our political life." Berlusconi, entrepreneur and media baron, entered politics in the aftermath of the 1990s transformations and the collapse of the Christian Democrats with many of the latter's votes shifting to Berlusconi's party, Forza Italia. His company, Fininvest, is under investigation for alleged bribing.

Former Communists, who head a government for the first time in their new manifestation as the Left Democrats (D.S.), have defended the judges and their drive against corruption and the Mafia. Walter Veltroni, the party secretary, described the post-verdict climate thus: "I perceive a great desire for a restoration of the 1980s. It is as if a part of the political system has considered everything that has happened since the end of the 1980s as a troublesome parenthesis in the so-called normality of Italian life, a parenthesis to be removed as quickly as possible." ■

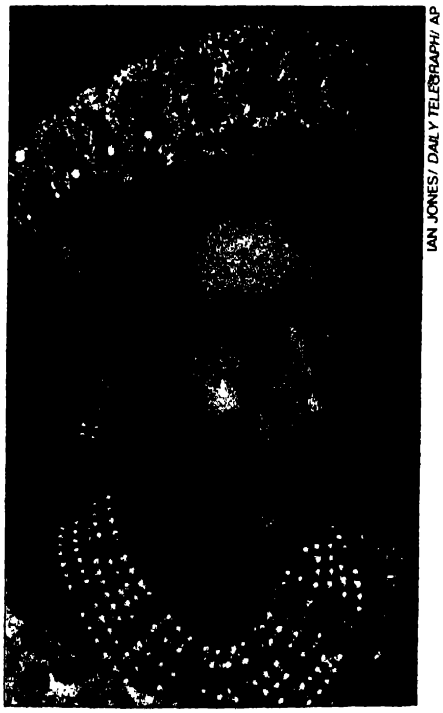
Staying with the monarchy

Australians vote against a republican form of government and reject a proposal to recognise Aboriginal communities as the "nation's first people".

P.S. SURYANARAYANA
in Singapore

IN a vote that marked a defining moment in Australia's history, the 12.3 million eligible voters of the country rejected on November 6 by a 55-45 per cent vote differential a republican form of government that was offered for their consideration. A yes vote in the referendum, in which voting was compulsory, could have enabled Canberra to renounce the British Crown as its constitutional head of state and choose a system of periodically electing an Australian as President with just as much ceremonial powers as Queen Elizabeth II now enjoys.

The result, however, did not eclipse the campaign-time argument that the republicans would have favoured a more radical option of choosing a native President in a direct election – if such a proposition had been put to vote. In the event, the monarchists had the last laugh. The republicans reasoned that the verdict reflected the people's opinion that they did not want a "politicians' republic".



Voters were required to decide whether or not to go in for a system under which Australia's two Houses of Parliament could, at a joint sitting, choose an Australian citizen as the country's President by a two-thirds majority. This alternative to retaining an external monarch as head of state was rejected. Nevertheless, the republicans wanted to snatch a victory of a different kind from the jaws of defeat – and they succeeded in doing so.

The verdict claimed a royalist victim when, signalling a departure from tradition, Prime Minister John Howard agreed to allow the Governor-General, a resident representative of the British Queen in her capacity as the constitutional head of state, to inaugurate the Sydney Olympics in 2000.

The Olympic Games are the next major international event on the Australian calendar, and they are expected to define and showcase the country's identity on the world stage. In the perception of many Australians, the Prime Minister should continue with tradition and inaugurate the Games himself, especially after Canberra had retained the monarchy as an article of faith. However, Howard announced on November 11 in Canberra that he would not inaugurate the Games: he said his decision was motivated by a desire to ensure that there be no controversy about the inauguration.

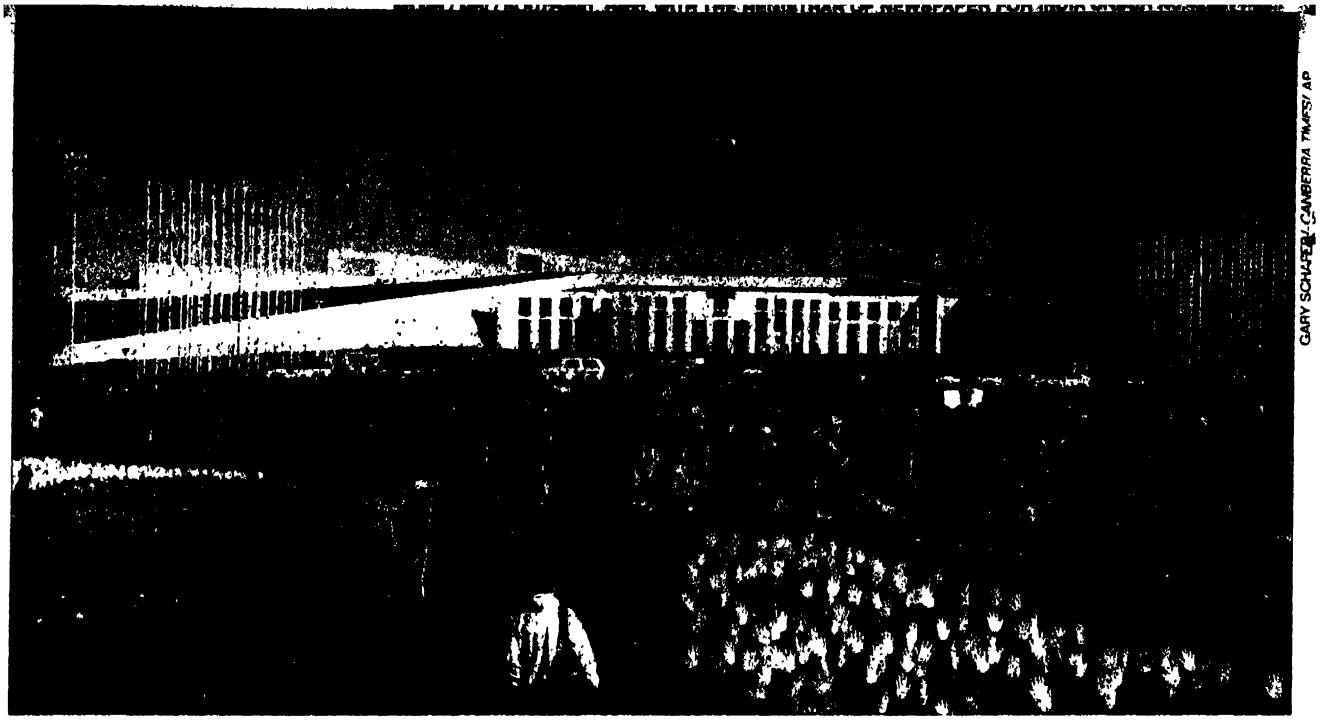
Asserting that his decision was in "no way related to the issue of a republic", Howard said: "The Australian people have spoken on that, and that issue is off the agenda now." That was Howard at his best, putting on a brave monarchist face.

Now, Kim Beazley, the Leader of the Opposition and a puritanical republican, has vowed to keep the anti-monarchy issue on the national agenda, if only because opinion polls, as distinct from the referendum verdict, reflected a popular preference for a people-oriented republican model that no government had so far put up for consideration.

IAN JONES/ DAILY TELEGRAPH/ AP

Queen Elizabeth II. Australians have voted to retain the British Crown as their constitutional head of state.

One other issue was put to vote on November 6, but it was almost eclipsed by the debate on the monarchy. Australians were asked to state whether they would approve a proposed preamble to their 1901 Constitution in order to acknowledge the Aboriginal communities and a more distinctive indigenous group known as the Torres Strait Islanders as "the nation's first people". This proposal too was rejected. Even a casual acquaintance with the history of the evolution of modern-day Australia from the times when it was a British "penal colony" would suffice to show that the proposal related to an issue that weighed heavily on the nation's conscience.



The proposed preamble would also have acknowledged the "deep kinship" of the Aborigines "with their lands" and the importance of their "ancient and continuing cultures which enrich the life of our country".

It would further have recognised the importance of the contributions made by non-white migrants of Asia-Pacific origins and the value of the environment as an asset, and would have commended the role of Australian war veterans.

The idea behind the proposed preamble was to enumerate the "core values" that would bind future generations of Australians to a vision that could facilitate the country's transition to a post-modern society which protects and cherishes multicultural values.

Howard was upset that amidst the heat and dust and the passions raised by the republican debate the people had rejected the preamble plan without considering it carefully.

However, the Aboriginal communities, who constitute 2.1 per cent of Australia's population of 19 million, were themselves not overly inspired by the expression of noble sentiments in the proposed preamble. Aboriginal leaders expressed regret that they had not been consulted while drawing up the fine print of the draft preamble that was presented to the voters. In their view, the draft had not acknowleged the land rights of the Aborigines, which form a polit-

GARY SCHAFER/ CANBERRA TIMES/ AP

Outside the National House in Canberra, a demonstration in July 1998 by Aborigines and their supporters in protest against a bill that sought to restrict the land rights of the indigenous people.

ically controversial issue, as also the real identity of the original inhabitants of the Australian continent.

The defeat of the preamble proposition is in some ways, but not explicitly, linked to the far-Right views propounded by Pauline Hanson, leader of the One Nation Party. Pauline Hanson's political platform is that Australia belongs to the original white settlers and their descendants of Anglo-Saxon and other European origins. Her One Nation Party was, of course, roundly defeated in the "millennium" national parliamentary elections held in October 1998. However, a year later, it is evident that her brand of politics has not altogether lost its appeal in Australia, at least on the margins of public discourse.

The Asia-Pacific question, in a mode that is not linked directly to the Pauline Hanson factor, was a defining paradigm (even if only behind the scenes) in regard to the basic republican issue. During the referendum campaign, the republican protagonists of Asia-Pacific origin, such as Jason Li, as well as white monarchists seemed to agree that the monarchy issue cut across racial lines. However, the referendum result, as perceived in some neighbouring Asian states, seemed to indicate just where lay the heart of the archetypal Australian – not yet a truly cosmopolitan persona, as some Canberra politicians have spoken about. The latest Australian vote in "the last of the century" was, in this perspective, seen as a continuing reaffirmation of the primacy of the Anglo-Saxon orientation of the average Australian.

It is debatable whether this view, which has not been openly articulated by any government in the Asia-Pacific region, should worry Australian policy-planners at all as they seek to carve out a greater role for Canberra in regional and international theatres, consistent with their perceptions of its strengths. Of considerable interest to Australia's Asia-Pacific neighbours is Canberra's latest military intervention in East Timor on behalf of the United Nations and the Howard Government's willingness to lead, if so assigned by the world body, a new peace-keeping force to help that sovereign-state-designate find its feet.

ROB GRIFFITH/ AP

Arriving at a polling station in Sydney to vote in the November 6 referendum, Prime Minister John Howard, a confirmed royalist, ignores a republican supporter who tries to hand him a campaign pamphlet.

During the run-up to its engagement in East Timor, a tiny and impoverished enclave with potential strategic relevance, Australia crossed quite a few diplomatic landmarks. These included its failed proposal for a European-style Conference on Security and Cooperation in Asia and the 1995 Australia-Indonesia Agreement on Maintaining Security (AMT), which was recently disavowed in some measure by Jakarta in anger over Australia's intervention in East Timor. These realities should also be seen in the context of Howard's frequent affirmations of faith in Australia's security linkage with the United States (the latest such reference being the one that he made while discounting fears about a backlash of the referendum vote in the Asia-Pacific region).

Given the strong U.S. orientation in Australia's foreign policy, the vote in the referendum may seem somewhat anachronistic, despite the reasoning that Australians did not feel the need to re-fix their Constitution because it had not broken down in the first place. Not surprisingly, however, a convert to the republican cause, former Prime Minister Malcolm Fraser, has said that the British "monarchy can't do anything more for Australia" and that, as "a more adult nation", Australia should "move on". But there is no sign yet of a fast-track to a republic. ■

A mandate for democratic rectitude

The issue of the military coup in Pakistan dominated the deliberations at the Commonwealth Heads of Government Meeting in South Africa.

M S PRABHAKARA
in Durban

THE Commonwealth Heads of Government Meeting (CHOGM) met for the first time in South Africa, in Durban, from November 12 to 15 Given the important role that the Commonwealth as a structure has played in the struggle against apartheid, even if under pressure from the majority of its members outside the so-called ABC (Australia, Britain and Canada) group of countries, it was appropriate that the 50th meeting of the heads of Commonwealth governments, the last in this millennium, took place in South Africa

As is now the practice, the Commonwealth leaders took off over the weekend (November 13-14) to a retreat' at the exclusive Fancourt Hotel and Country Club near George The media were ostentatiously barred from intruding on the informal interactions that the leaders were supposed to be having at the retreat But since the relations between the political leaders and the media have always been symbiotic, 'pools' from the media were provided access to the retreat

THE theme of CHOGM 1999 was "Globalisation and People-Centred Development" Although matters of economic development of Commonwealth countries in the unforgiving context of globalisation constituted the main agenda, the political developments in Pakistan dominated much of the deliberations

The deliberations revolved mainly around two issues First, what action the Commonwealth proposed to take, further to the decision taken on October 18, in an automatic application of the Millbrook Action Programme (named after the retreat in Millbrook during the Auckland Commonwealth summit of 1995) in the Harare Declaration to suspend Pakistan from "all councils of the Commonwealth". Second, the substance of the Report to the Secretary-General of the four-member Commonwealth Ministerial Action Group (CMAG), which made a two-day visit to Pakistan (October 28-29), and whether its widely leaked recommendation, substantially not very different from the decision taken by the CMAG on October 18, in the wake of the coup, suspending Pakistan from 'all councils of the Commonwealth' would be enlarged by CHOGM to a suspension from the Commonwealth as a body and, further as an extreme measure, expulsion from the Commonwealth Another issue was whether the recommendation of CMAG that "Pakistan be given two years to make demonstrable and sustained progress towards the restoration of democracy should be adopted as it stood or whether CHOGM would modify it

In the event, CHOGM's decision on Pakistan remained in essence, though not in its entirety, substantially the same as that taken immediately after the coup, though there is a difference in emphasis The statement of October 18 from Marlborough House, London, read thus

"CMAG unanimously condemned the unconstitutional overthrow of the democratically elected Government of Pakistan as a serious violation of the Commonwealth s fundamental political principles as enshrined in the Harare Commonwealth Declaration The Group decided therefore that the Pakistan military regime should forthwith be suspended from the councils of the Commonwealth, including the forthcoming Commonwealth Heads of Government Meeting, pending the restoration of democracy in the country

The CMAG further called upon the military regime in Islamabad to set without delay a timetable for the restoration of a democratically elected government

The Group also called upon the regime of General Pervez Musharraf to uphold the safety well being and legal rights of Prime Minister Nawaz Sharif, other Ministers and all others who have been detained

On the other hand, the decision on Pakistan as presented in the final communique of CHOGM said

'Heads of Government condemned

The new Commonwealth Secretary-General Don McKinnon of New Zealand with outgoing Secretary-General Chief Emeka Anyaoku, at a news conference on November 12. At centre is South African President Thabo Mbeki.

the unconstitutional overthrow of the democratically elected Government of Pakistan on October 12, 1999. They believed that no legitimacy should be accorded to the military regime and called for the restoration of civilian democratic rule without delay. They endorsed CMAG's decision to suspend the military regime in Pakistan from the councils of the Commonwealth, pending the restoration of democracy in the country. Heads of Government requested CMAG to keep the situation in Pakistan under review and be prepared to recommend further measures to be taken by the Commonwealth if progress to democracy is not made speedily."

The two new points in the final communique are the omission of a reference to any time-frame for the restoration of democracy and the call for the immediate release of "Prime Minister Nawaz Sharif".

TO the extent one could make out, India did not openly exert itself to influence the stand of CHOGM on Pakistan. In his brief and only intervention on the Pakistan issue, Prime Minister A.B. Vajpayee made in the first executive session, asked for an undiluted application of the Milbrook Action Programme. He noted that while the four member Ministerial Mission had called for "demonstrable benchmarks of progress (which) would include within the first year of the period of review the reform of electoral process and institutions including the establishment of a fully independent electoral commission", the fact of the matter was that institutions of democracy did exist in Pakistan, "including an independent Election Commission which conducted and supervised the 1997 General Elections to the satisfaction of the Commonwealth Electoral Observers Groups".

This was truly one occasion when India really did not try to exert itself overmuch to 'isolate' Pakistan. Indeed, Minister of External Affairs Jaswant Singh told the Indian media that India had not even tried to take the 'Asian seat' on the CMAG, as a matter of policy.

Sources other than official ones and off-the-record Indian briefings confirmed that outrage over the coup was widespread, and that this and was most forcefully articulated by the heads of government of Nigeria and Bangladesh, both of whom had direct and personal memories and experiences of military regimes. During a media briefing, President Olusegun Obasanjo of Nigeria (the only head of government to address the media directly) spoke feelingly of his sadness over the coup and dismissed suggestions of a possible consensus in CHOGM about 'good' and 'bad' military regimes, the regime in Pakistan coming under the former category. At almost every media briefing, questions relating to the stand of the Commonwealth on the Pakistan developments predominated. Indeed, at the media briefing addressed by Chief Emeka Anyaoku, the CHOGM Secretary-General, on November 11, the majority of the questions dealt with the situation in Pakistan.

A RELATED and far more important issue that dominated CHOGM '99 was the future role of the CMAG. The question before CHOGM was whether the CMAG, whose Report to CHOGM '99 (October 1, 1999), the second report of the CMAG on the 1991 Harare Declaration, had recommended (in Chapter 5) a significant enlargement of its mandate to enable the CMAG to deal with situations where "there is not a complete derogation from democracy and constitutional rule, but where is a clear-cut breakdown of democracy, sustained abuse of fundamental human rights, or otherwise serious or persistent violations of Commonwealth (sic) fundamental political values."

As instances, the recommendation cited three scenarios:

* "If national elections are postponed beyond the constitutional life of the government without the proper observance of all the prescribed constitutional provisions."
* "If a government bans or impedes, on a systematic and sustained basis, the legitimate political activities of opposition parties, groups, individuals or the media."
* "If there is compelling evidence, corroborated by other recognised and independent national or international observers, of a government's systematic and widespread violation of the fundamental human rights of citizens through the abrogation of the rule of law or the independence of the judiciary."

In such eventualities too, as in situations where democracy and constitutional rule had been clearly overthrown through military intervention, the Report recommended that the CMAG be "seized of the situation" and endeavour to promote the Harare principles "in all appropriate ways".

This recommendation, envisaging an enlarged role and mandate for the CMAG, which received wide support from non-governmental organisation (NGO) lobbies and civil society structures, however, watered down to just one paragraph in the final communique:

"Heads of Government commended the role played by CMAG as a custodian of the Harare Principles. They agreed that CMAG should continue to address serious or persistent violations of those Principles and that its future mandate should be considered further by the Commonwealth High Level Group."

The 'High Level Group' (HLG) is a new structure that has been established by CHOGM '99 "to review the role of the Commonwealth and advise it on how best to respond to the challenges of the new century". To be chaired by South African President Thabo Mbeki in his capacity as Chairman of the Commonwealth (a new position, making the Queen both in form and in terminology the ceremonial head of the Commonwealth) the 10-member HLG includes the heads of government of Australia, Fiji, India, Malta, Singapore, Tanzania, Trinidad and Tobago, the United Kingdom and Zimbabwe. It is to submit its report to the next CHOGM summit, which is to be held in Canberra in 2001.

Given the comprehensive nature of the HLG's primary mandate, its secondary task of considering the 'future mandate' of the CMAG is unlikely to receive its most urgent attention. The pattern of formulating apparently radical-sounding proposals and shelving them by seeking more time to study them, or forming another committee to study them, is not exactly new.

However, it would be unfair to attribute the shelving of the proposal to enlarge the mandate of the CMAG to bureaucratic lassitude alone. The proposals, made by the CMAG itself, are far-reaching and have important and unforeseeable implications for the concept of sovereignty of nation-states. Indeed, the anomaly is inherent even in the Harare Declaration, especially in the vagueness of the crucial formulation about 'good governance'. It does not take much imagination to see how such a formulation may easily degenerate into the most malignant kinds of intrusion into the sovereignty of nation-states by countries and structures with an agenda of re-colonisation of the world through self-appointed vigilantes of democratic rectitude and good governance. ■

Crackdown in Pakistan

The Musharraf regime turns the heat on politicians and others who have looted the nation's wealth, but its final intention is as yet unclear.

AMIT BARUAH
in Islamabad

PAKISTAN'S military regime has launched a major operation against bank loan defaulters. There is popular support for the operation, which aims to revive the ailing financial institutions and seeks to bring to book people who have looted the wealth of the nation. According to an official communique, this is the first such campaign since the country came into existence 52 years ago.

Cronyism, which has been a feature of the local culture, straddles the fields of politics and finance in Pakistan. The foundation for this culture was laid during Gen. Zia-ul-Haq's regime between 1977 and 1988. With the end of martial law in 1985 and the return of an elected government in 1988, it was expected that Pakistan's rulers would pay greater attention to the needs of the people. Instead, the governments run by Nawaz Sharif and Benazir Bhutto enriched themselves at the expense of the masses as the Army watched from the sidelines. However, the fact that Gen. Pervez Musharraf's regime is looking for Admiral Mansoor-ul-Haq, who was the Navy chief under Benazir Bhutto, tells its own tale.

Sharif's penchant for grandiose schemes landed banks and financial institutions in deep trouble. Banks are yet to overcome the problems created by the "yellow cab" scheme launched during his previous tenure. However, it is the "big fish" that have created the real problems for the economy. Nearly 90 per cent of the national budget goes to service debts and meet defence expenditure, leaving very little by way of funds for development needs. If Pakistan is to come out of the economic mess, it is essential that the government generates revenue.

Apart from loan defaulters, the military regime has targeted those who have defaulted payments on their utility bills. A report in the Urdu daily *Pakistan* said that the Water and Power Development Authority (WAPDA) had to recover Rs.3 crores from the Inter-Services Intelligence (ISI) Directorate, Rs. 3.25 crores from Radio Pakistan and Rs. 7.5 crores from the Heavy Mechanical Complex.

The deadline for the the month-long repayment period ended on November 16 and the banks and financial institutions had recovered Rs.8 billion of outstanding loans and Rs.2 billion in utility payments. At least 30 persons, including former Ministers belonging to various political parties, were arrested in a crackdown on defaulters from November 17. A press release issued by the National Accountability Bureau (NAB), set up under a presidential Ordinance, listed Nawaz Sharif, his brother Shahbaz Sharif and former Ehtesab Bureau Chief Saifur Rehman among the defaulters. The release added: "Some persons like Asif Zardari... are already in jail while Benazir Bhutto, wanted in a number of cases, is a proclaimed offender and outside the country."

Sharif, who is accused of hijacking and attempting to murder the Army chief, Gen. Musharraf, along with other passengers on a Pakistan International Airlines aircraft on October 12, was also booked under the new Accountability Ordinance. He was produced before a court in Karachi on November 19; he could face the death penalty if convicted on the charges of hijacking, attempt to murder and criminal conspiracy. Under the new Accountability law, a person convicted of corrupt practices can face up to 14 years in jail and be disqualified from holding public office or contesting elections for 21 years.

The law stipulates that the NAB must investigate the case within 75 days, after which it is transferred to a special civilian court, which must decide the case within 30 days. An appeal has to be filed in the High Court within 10 days of the Accountability Court's verdict. The final appeal must be disposed of within 30 days.

Chairman of the NAB Syed Amjad Hussain, who is at present a serving Lieutenant-General, can authorise the detention of any person for 90 days. No person can be released without his written orders. The NAB has also been given the powers to freeze property. Interestingly, the Ordinance will enable the military regime to investigate cases of corruption and corrupt practices dating back to 1985, when martial law was formally lifted by Gen. Zia and the procession of civilian governments began. The Ehtesab Act of 1997, enacted when Nawaz Sharif was in power, only permitted investigations from 1990 onwards.

ZIA MAZHAR AP

Surrounded by police and security personnel, Nawaz Sharif at a court in Karachi on November 15.

Current Affairs Editor of *The News*, Imtiaz Alam, wrote recently that the military operation against defaulters had been even-handed and politicians from both sides of the political divide were targeted. However, he added: "The notable exceptions are the serving armed forces personnel, the judiciary, the bureaucracy and technocrats employed by the previous government." Action against a few defaulters, according to him, would not eradicate the root causes of corruption. "But it may set an example by aiming at top ex-officials and politicians who had escaped so far. The best course would be to keep the swift and short surgery limited while focussing on long-term structural and institutional remedies." He lauded Gen. Musharraf for initiating the

Pressure on Pakistan

AMIT BARUAH

USING harsh language to denounce the October 12 coup in Pakistan, the Commonwealth Heads of Government Meeting (CHOGM) in Durban, held from November 12 to 15, approved Pakistan's continued suspension from the Commonwealth councils.

In response to the Commonwealth statement, the Pakistan Foreign Office said that the erstwhile British colonies had ignored "ground realities" in Pakistan as well as the CMAG report. According to the authorities in Pakistan, the CMAG report acknowledged the "strongly felt desire for change in Pakistan" but did not adequately address the failure of Pakistan's democratic regimes to provide "just and honest government".

The Foreign Office said: "The summit communique has lost sight of substance and dwelt on the form of democracy." It added that CHOGM did not take into account the declared determination of the Government "to move expeditiously and simultaneously on the twin tracks of reform and democratisation". The statement added that "Pakistan would continue to interact with the Commonwealth exclusively on the basis of reciprocity, the norms of diplomatic propriety and our national interests."

The Durban statement will create problems for Pakistan's military regime in its search for international legitimacy. The flying visits made by the Army Chief, Gen. Pervez Musharraf, to Saudi Arabia, the United Arab Emirates, Qatar and Turkey showed that the search for legitimacy is very much on. The military regime correctly believes that it needs recognition in the right quarters and should remain engaged with the international community. The Commonwealth statement denying "legitimacy" to the military regime must be particularly unsettling for it.

It needs to be seen what kind of approach leading members of the Commonwealth, such as the United Kingdom, plan to adopt in bilateral dealings with Pakistan. If the Commonwealth declaration is to be taken seriously, it could affect bilateral dealings between member-nations and Pakistan. In the face of the Commonwealth's tough stance, Pakistan too will look for a new strategy of engagement. It will try to develop and rebuild democratic institutions at all levels, including at the grassroots.

Although Pakistan has articulated this position formally, it will need to work out an arrangement within the Commonwealth. This club of nations is conscious of the fact that having taken a position on democratic principles in Africa, it must apply the same to Pakistan. According to the Millbrook Action Programme, countries in violation of the Harare declaration of the Commonwealth, particularly in the event of an unconstitutional overthrow of a democratically elected government, should return to democracy within a reasonable time-frame.

The action programme speaks of a "stipulation of up to two years as the time-frame for the restoration of democracy where the institutions are not in place to permit the holding of elections within, say, a maximum of six months". While formal institutions to hold elections are in place in Pakistan, their credibility and independence are another matter.

Pakistan is also miffed at India's approach at the Commonwealth summit. New Delhi saw the summit as an occasion to pursue its own agenda and undermine the military regime in Pakistan with which, for the moment, it does not propose to have any dealings. A statement issued by the Pakistan Foreign Office said: "All friendly countries are dealing with the Government of Pakistan led by General Pervez Musharraf....the Indian leaders spared no effort to malign Pakistan at the Commonwealth summit seeking stronger action against Pakistan. Having failed in their ill-intentioned exertions, they are now giving vile twists to the Commonwealth decisions. This is deplorable." ■

process, but argued that "he must also know how to conclude it at the earliest... without getting bogged down under the burden of the unachievable."

The only voices of dissent are from the religious Right, who are uncomfortable with the General's choice of candidates to the apex National Security Council (NSC) and the Cabinet. Most of the appointees are Western educated, except for an Islamic scholar inducted later. Jamaat-e-Islami chief Qazi Hussain Ahmed has been quoted as saying that those who themselves had plots worth crores of rupees in different cities were not fit to check others' accountability. This was a potshot at Gen. Musharraf, who made public his assets, which include plots of land in different cities. He also said that Finance Minister Shaukat Aziz was an employee of an American bank (Citibank) while Omar Asghar Khan, who ran a non-governmental organisation (NGO), lived on foreign aid. Such persons, the Qazi claimed, could not act in the national interest.

Late in 1998, the Jamaat leader, while addressing a congregation in Islamabad, described the Army's Corps Commanders as "crore commanders" – a description that provoked a sharp rejoinder from Rawalpindi. So far, the General has not found it necessary to dance to the tune of the religious gallery and this has displeased the religious Right, of which the Jamaat is an important constituent.

At a recent press conference in Islamabad, Lashkar-i-Taiba chief Hafiz Muhammad Saeed, however, indicated that his group would not enter into a confrontation with the regime. Nevertheless, he extended an "invitation" to Gen. Musharraf to base Pakistan's law and Constitution on the Koran and the Sunnah. He said that in Egypt and Algeria Islamic elements were branded "terrorists" and the state acted against them. He said that in Pakistan the Lashkar, which had acknowledged its military action in Kashmir, had no intention of getting into a conflict with the government. The Lashkar chief is more interested in persisting with the "Kashmir *jehad*". Given the nature of this task, it is impossible for the Lashkar to operate without the logistical support of the Pakistan Army.

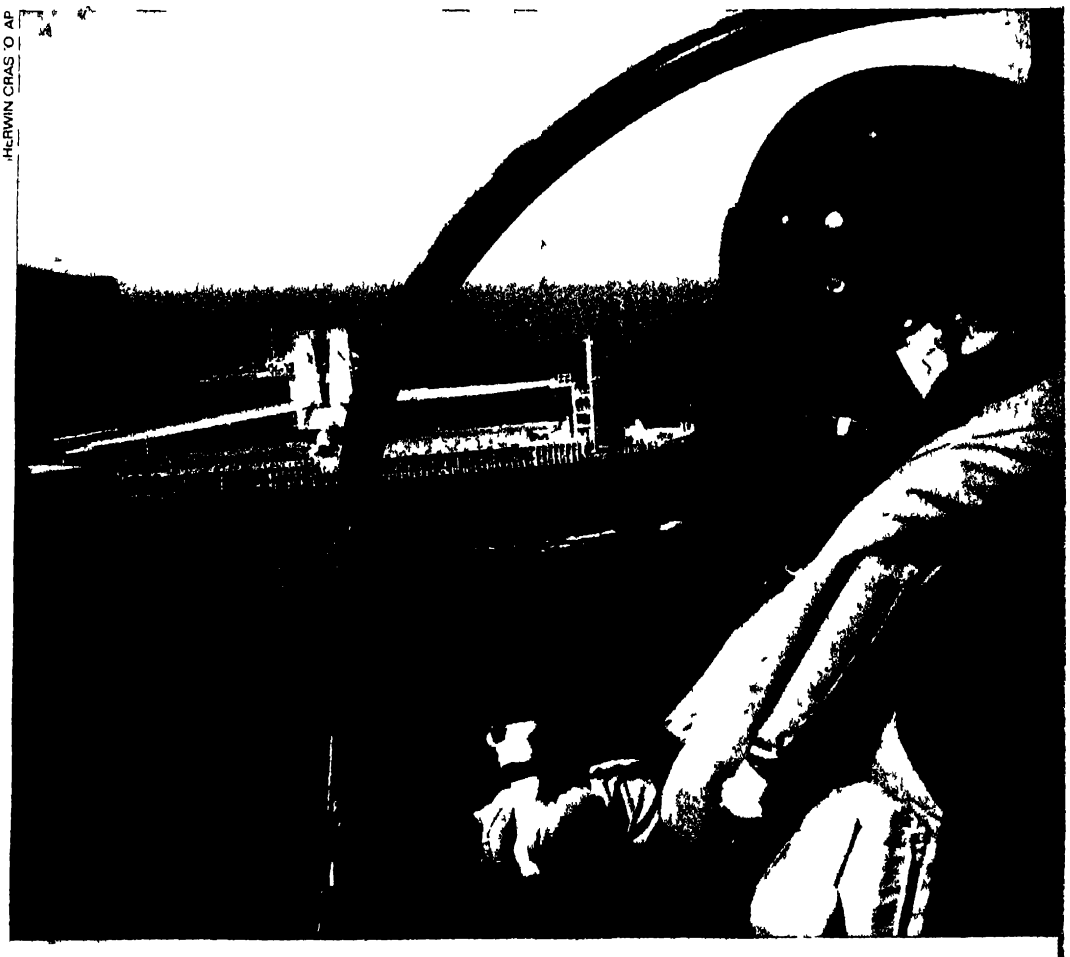
The Lashkar chief has articulated an "escape route" to buy peace with the government while continuing with the "*jehad*" in Kashmir and building up the organisation's strength within Pakistan. Such a formula will help silence critics who want a "pure" Islamic system to take root in Pakistan.

If Gen. Musharraf's belief in a tolerant Islam is genuine, he will not only have to encourage that feeling within Pakistan, but also try to halt the "*jehadi* forces" that are using Pakistan as a base to export Islamic militancy. ■

Pirates on the prowl

The Indian Navy and the Coast Guard help secure a hijacked ship in the Indian waters. Is there an LTTE angle to the incident?

PRAVEEN SWAMI
in Mumbai



ON October 22, the 8,900-tonne M V *Alondra Rainbow* disappeared The Panamanian-registered ship had left the port of Kuala Tanjung in Sumatra, carrying 7,000 tonnes of aluminium ingots for delivery at Milke, Japan Radio contact was lost a few days later *Alondra Rainbow*'s crew of 17 were found 11 days later by the Japanese Maritime Security Agency, floating in a life raft off the south Thailand coast after having been jettisoned The Japanese owned ship had been hijacked by armed pirates, who had taken it out into the Arabian Sea

It would not have been surprising if the *Alondra Rainbow* had never been seen again Dozens of hijacked ships routinely disappear in the pirate infested seas off South-East Asia – the Malacca Straits in particular – and the South China Sea (In 1998, 192 ships were hijacked and 61 crew members killed by pirates in these areas Officials have pointed to a steady rise in piracy through this year too) But prompt action by the Indian Navy and Coast Guard has led to the recovery of *Alondra Rainbow* and the arrest of the pirates. The operation to secure *Alondra Rainbow* is being hailed by security officials in South-East Asia as a model of the kind of international cooperation needed to fight maritime hijacking.

News of *Alondra Rainbow*'s disappearance was released to merchant ships in the region through the Piracy Reporting Centre in Kuala Lumpur, part of the International Maritime Bureau (IMB) The IMB put out details of the ship's shape and configuration, asking any vessels that spotted it to report the matter News came from the merchant vessel M V *Al-Shuadda*, which sighted the ship, headed northwest, 96 km southwest of Kanyakumari The IMB notified the Indian Coast Guard which sent a Dornier aircraft to investigate By November 13, the aircraft and the Coast Guard ship *Tarabhat* had made contact with the ship off Ponnani, Kerala

For two days, the pirates on board *Alondra Rainbow* traded small-arms fire with *Tarabhat* and the Dornier, refusing to halt The ship's engines were pushed to the limits reaching a speed of 14.5 knots This was enough to outstrip *Tarabhat*, and the Navy's missile corvette, *INS Prahaar*, was alerted on November 15 *Prahaar*, which was on routine exercises in the Arabian Sea, headed south to cut off *Alondra Rainbow* near Goa But despite a fire having broken out on the ship after the engines overheated the pirates refused to stop At 7 15 a m the next day *Prahaar* fired its heavy guns across *Alondra Rainbow*'s bows

Before they surrendered, the 15 pirates made a desperate effort to sink the ship opening the inlets to its sea chest and several valves meant to keep water

JH-RWIN CRASTO AP

M.V. *Alondra Rainbow*, seen from an Indian Coast Guard helicopter off Mumbai on November 20.

out. It took sustained operations by teams of divers and experts from *INS Delhi*, *INS Gomti* and the Coast Guard ship *Veera* to keep the merchant ship afloat. *Alondra Rainbow*, which the pirates had repainted to carry the name M.V. *Megha Rama* and given fake Belize registration, was towed into Mumbai on November 20. The arrested pirates will now face interrogation by Navy Intelligence and the Intelligence Bureau (I.B.), and legal proceedings to return the ship and its cargo to its legitimate owners will commence.

Coast Guard officials said that part of *Alondra Rainbow*'s cargo may have been sold in Cambodia as part of an arms deal between the pirates and the Liberation Tigers of Tamil Eelam (LTTE). Reports suggested that at the time of the ship's detection, it was carrying only 4,000 tonnes of aluminium ingots. While no evidence of LTTE complicity was available, some Coast Guard officials believe that linkages between South-East Asian insurgent movements and the Sri Lankan terrorist organisation make such a deal possible. IB officials, however, are less than enthused by the theory, and believe that the hijacking of *Alondra Rainbow* was merely a crime for profit.

HIGH-SEAS hijacking is growing alarmingly, a phenomenon some believed to be fuelled by the economic recession in South-East Asia. In June, the United Kingdom's Shipping Minister, Glenda Jackson, called attention to International Maritime Organisation (IMO) statistics which showed that attacks on ships on the high seas had increased by 15 per cent over the previous 18 months. Ships were advised to exercise special caution between 1 a.m. and 6 a.m. and to maintain continuous radio contact with other vessels on 2182 megahertz while travelling off South-East Asia, Somalia and the island of Socotra. IMO officials expressed concern that several recent hijackings involved the use of automatic weapons, and increasingly resulted in crew fatalities.

Merchant ship cargo, often valued at millions of dollars, has provoked increasingly gruesome crimes. On March 5, the Guangdong Provincial Public Security Department of China announced the arrest of 20 pirates for the mass murder of 23 Chinese sailors the previous year. The sailors had been shot dead on November 16, 1998, and their bodies thrown overboard from their Hong Kong-registered ship, which had set sail from Shanghai. The bodies were found at sea in December 1998. The ship was then reflagged, repainted, and handed over to a new crew. China faced severe criticism from the IMB, in February, for its failure to prosecute members of a pirate gang caught red handed, and some marine journals charged elements in the country's Navy of being complicit in such crimes.

But the March arrests show that in recent months, China has been coming down heavily on maritime hijacking. In January, port authorities at Zhangjia in Jiangsu province of China while inspecting engine markings on the Honduran-registered *Sanei-1*, discovered that it was in fact the Panamanian-registered freighter *Tenyu*. *Tenyu*, owned by the Japanese shipping company Masumoto Kisen KK, had been carrying aluminium ingots worth 500 million yen when it left Indonesia for South Korea on September 27, 1998. Its 14-member crew – two South Korean and 12 Japanese – were never seen again. Chinese police officials who interrogated Tenyu's Indonesian crew found that the sailors had no knowledge of the ship's past.

Chinese maritime authorities also picked up seven suspects in connection with the disappearance of the bulk carrier *Cheung Son*, Panama-registered again, in late December 1998. The mineral-ore laden ship had vanished while sailing towards China through the Taiwan Straits. Nothing was known for certain about its 23-member crew until fishermen found three bodies off the South China coast. The Hong Kong authorities identified the three bodies as those of members of the *Cheung Son*'s crew. The deaths prompted Noel Chung, regional manager of Piracy Reporting Centre, to call for "strong government action to wipe out piracy in Asian waters before it gets out of control".

Chances, however, are that even first-rate transnational cooperation, of the kind that led to *Alondra Rainbow*'s recovery, will not end marine crime much. For one, customers for a ship's cargo are easy to come by. In June, armed pirates in specially equipped speedboats stormed a Thai tanker carrying 2,060 tonnes of gas oil, a fuel used by ships. Twelve members of the crew were imprisoned in the ship's cabins for two days and then ordered overboard into a motorboat with a faulty engine. They drifted in the rough seas for 14 hours before being rescued by a passing ship. One sailor was held hostage because he knew how to operate the ship's valves. The attack, which took place off the Malaysian resort island of Tioman, was one of a string of similar enterprises capitalising on the ready market for gas oil and petrol.

A spectrum of commodities attract pirates. A fortnight after *Marine Fortuner* left the Chinese port of Nantong on March 1, and headed for India with over 6,000 tonnes of soda ash, the ship was hijacked by 20 heavily armed pirates. An IMB report on the hijacking produced results; port authorities in the city of Fanghchenggang discovered that technical data of the Honduras-registered *Nuovo Tierra*, which docked for maintenance work in May, was identical to that of the missing ship. In this case, all 14 crew members confessed to the Chinese police, their involvement in the hijacking. The Taiwanese-owned ship was returned to its owner, but the cargo had long been disposed of.

JUST how the *Alondra Rainbow* affair ends remains to be seen. Coast Guard Deputy Inspector General A.K. Mahajan said that his organisation would "try to find out whether the pirates have any link with the Inter Services Intelligence or the LTTE". In the so-far improbable event that they do, India's security establishment will have one more serious cause for concern. I.B. investigators are certain to focus on possible links between the hijackers and insurgent groups in South-East Asia, particularly Myanmar. But even if no such connection is found, *Alondra Rainbow*'s hijacking could mean trouble for India.

As the Chief Staff Officer in charge of the Western Naval Command's Operations, M.P. Taneja, pointed out, the *Alondra Rainbow* affair is the first reported incident of piracy in Indian waters. But with the thinly-policed Andaman Islands perched over South-East Asia's troubled waters, and pirates evidently looking for fresh markets in West Asia, both the Coast Guard and Navy will have to work hard to ensure that the seas around India do not become a major transit route for pirates. IMB official, Captain P. Mukundan, speaking to Singapore's *Shipping Times* in Kuala Lumpur, hailed the Indian operation as a "perfect example of cooperation". Indian maritime security officials can only hope that much more operations of this nature will not be needed in the near future. |

A RAVAGED REGION

After the killer cyclone, disease and famine stalk coastal Orissa.

SUHRID SANKAR CHATTOPADHYAY
in Orissa

COASTAL Orissa remained grim two weeks after the October 29 cyclonic storm had devastated vast areas of it. The death roll mounted by the day as several affected areas, which had been rendered inaccessible, were accessed. The official toll as of November 15 stood at 9,524, the district-wise break-up being: Jagatsinghpur 8,119; Puri 287; Cuttack 392; Kendrapara 242; Nayagarh 3; Khurda 84; Bhadrak 92; Keonjhar 27; Dhenkanal 50; Jajpur 158; Balasore 48; and Mayurbhanj 7. Unofficial estimates put the toll above 50,000.

According to official estimates, 1.26 crore people in 12 districts have been affected. As many as 12.48 lakh houses have been damaged, and 15.7 lakh hectares of paddy crop and 32,956 hectares of other crops destroyed. Moreover, most of the paddy fields have been rendered uncultivable by the saline water carried 15 km inland by massive tidal waves.

State Revenue Minister Jagannath Patnaik, who is in charge of the relief operations, told *Frontline*: "If immediate steps are not taken, we will be saddled with a drought-like situation. We are giving top priority to developing a strategy for rabi cultivation." However, owing to the large-scale destruction of cattle, the State faces an acute shortage of draught animals. The Government planned to procure bullocks from the unaffected regions of the State and also from Andhra Pradesh, Haryana and Punjab. Tractors, not commonly employed in ploughing operations in the State, were also being mobilised. Negotiations were on to procure seeds from Maharashtra and Gujarat. "We have invited horticulturists to help us out in areas where saline water has ruined the land. We are willing to change the pattern of cultivation if necessary," Patnaik said.

The State government had sought a Central assistance of Rs.10,000 crores. The Centre granted Rs.200 crores. Patnaik said that the assistance extended was insufficient as rehabilitation work alone would require Rs.2,500 crores. The Government plans to approach the World Bank for low interest loans for housing, electricity and infrastructural projects. "One of our top priorities is to rehabilitate the people who have been rendered homeless. HUDCO (Housing and Urban Development Corporation) has evolved a Rs.190-crore housing scheme. We plan to construct cyclone-proof houses," the Minister said.

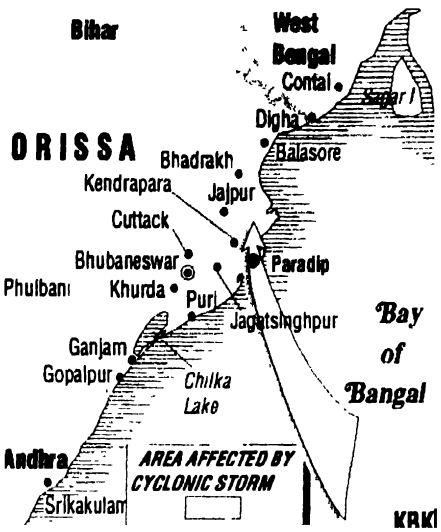
ALTHOUGH the water level had receded in most areas, several villages in the Ersama block of Jagatsinghpur district, such as Padmapur, Bhitarandhari, Dhinkia, Noagaon, Bagadia, Balitutha, Gandikipur and Kunjakothi – were still inundated. Stagnant water and rotting bodies and carcasses posed a major threat to the survivors. Relief materials were air-dropped in these areas. Unofficial reports stated that 37 villages in Ersama had been washed away by tidal waves. Bijay Nayak, who represents Ersama in the State Assembly, said: "I am sure that in Ersama alone more than 20,000 people have died. More than 50 per cent of them are Bengalis who came from Midnapore."

P.K. Pani, Additional District Magistrate of Jagatsinghpur, said: "We are unable to enter some areas in Ersama because of the overpowering stench of rotting bodies and stagnant water. More than 14,000 hectares of agricultural land there has been destroyed and rendered unfertile. We are staring straight at a drought."

Unofficial reports stated that the cyclone had claimed more than 5,000 lives in adjoining Balikuda. The Army cleared two roads to Ersama. In areas that were inaccessible, Army personnel supplied drinking water by boats. "We lower our boats east of Ersama and through a creek, deliver relief materials," Brigadier R.S. Rawat, who is in charge of relief operations by the Army, said. An Army team of 5,000 men planned to clear another road to Ersama via a bridge 5 km away. "Approaches to the bridge from both sides are blocked. We are clearing them," Rawat said.

The Army also planned to open a 30-bed hospital in Ersama. Three Army hospitals were functioning at Balikuda, Tirtol and Kendrapara. Two more were to be opened in Mahakalpara and Ersama. A team of Army doctors and volunteers from Pune, stationed at Balikuda, visited Ersama to treat patients. The Army cleared a stretch of 1,712 km of road, subsidiary roads and railway tracks; evacuated 24,201 people; treated 16,319 patients; and distributed 5,922 packets of food and 60,600 kilolitres of water. With the job of providing immediate relief over, the Air Force operated two aircraft to drop relief materials in Ersama and Balikuda, which remained inaccessible. The Air Force delivered a daily average of 27 tonnes of food materials.

V. SUDERSHAN



Chief Minister Giridhar Gamang.

The Army and volunteers of organisations such as the Anand Marg, the Rashtriya Swayam-sevak Sangh (RSS) and Christian missionary organisations were involved in the disposal of corpses and carcasses. The Government has instructed District Magistrates and gram panchayat chiefs to burn the bodies. "We are providing them as much petrol, diesel and other material required for this," Patnaik said. Of the 3.5 lakh head of cattle killed in the cyclone, about 75,600 have been disposed of.

Defence Minister George Fernandes, who heads the Central moni-

toring team, announced in Bhubaneswar on November 12 that a cyclone reconstruction authority would be formed to deal with the current crisis as also similar calamities that may occur in the future. The authority, comprising representatives of both the Central and State governments, would tackle long-term issues arising out of natural disasters.

Meanwhile, other Congress(I)-ruled States have adopted various districts affected by the cyclone. Puri has been adopted by Delhi, Kendrapara by Karnataka, Jagatsinghpur by Maharashtra, Bhadrak by Rajasthan, Jajpur by Madhya Pradesh and Keonjhar by Goa. The Orissa Government insists that the Congress(I) governments would merely supplement the relief materials and manpower already available and not adopt any district. However, Goa's Minister for Agriculture Sanjay Bandhekar told *Frontline*: "We will adopt Keonjhar. We will first assess the damage and then send officials to rehabilitate the people." The Goa government has set up a special cell for relief, and all administrative officers, Ministers, Members of the Legislative Assembly and Members of

Parliament in Goa have been asked to donate a month's salary to a relief and rehabilitation fund.

Senior Indian Administrative Service (IAS) officers of Orissa resent the policy of adoption. "This will give rise to friction between the administrative officers of Orissa and other States," a senior officer said on the condition of anonymity. He said that this was a political gimmick adopted by the Congress(I) ahead of the Assembly elections in order to project a picture of solidarity. "The man who is truly the knight in shining armour is Andhra Pradesh Chief Minister N. Chandrababu Naidu, who is monitoring all relief work from Hyderabad instead of politicising matters by visiting Orissa," he said. Apart from sending 2,000 government employees to undertake relief work, Chandrababu Naidu assigned experts from different departments, such as engineering, medicine, and urban development, to the affected areas.

Not all IAS officers were happy with the planning and execution of relief works. Pratap Mukhopadhyay, Member, Board of Revenue, and the second senior most officer in the State, said: "A crisis such as this cannot be controlled from one place. Senior officers should have been deployed immediately to the affected areas as on-the-spot decisions had to be taken. Junior officers in the ranks of District Magistrates and Additional District Magistrates often hesitate to take them."

He said that the disaster was as much man-made as it was natural. The persistent depletion of forests in the coastal belt

SUNIL MALHOTRA/REUTERS

Khandadhar village. The storm brought down innumerable trees and destroyed thousands of houses in coastal Orissa.

for the last 20 years had resulted in an ecological imbalance, he pointed out. The cyclone had swept away whatever little forest area was left and another cyclone of similar intensity would occur, he said. "It is a vicious cycle." Another senior officer expressed his displeasure at the way relief materials were distributed. "Two truck loads of lemon rice that came from Andhra Pradesh was dumped at the Kalinga stadium and it lay there for over 48 hours. The rice got spoilt and had to be destroyed," he said. He further said that more than 15,000 polythene covers were waiting to be distributed.

HIMANGSHU WATTS/TRS

Villagers outside their makeshift home in Paradeep. A spectre of starvation looms over the coastal belt of Orissa.

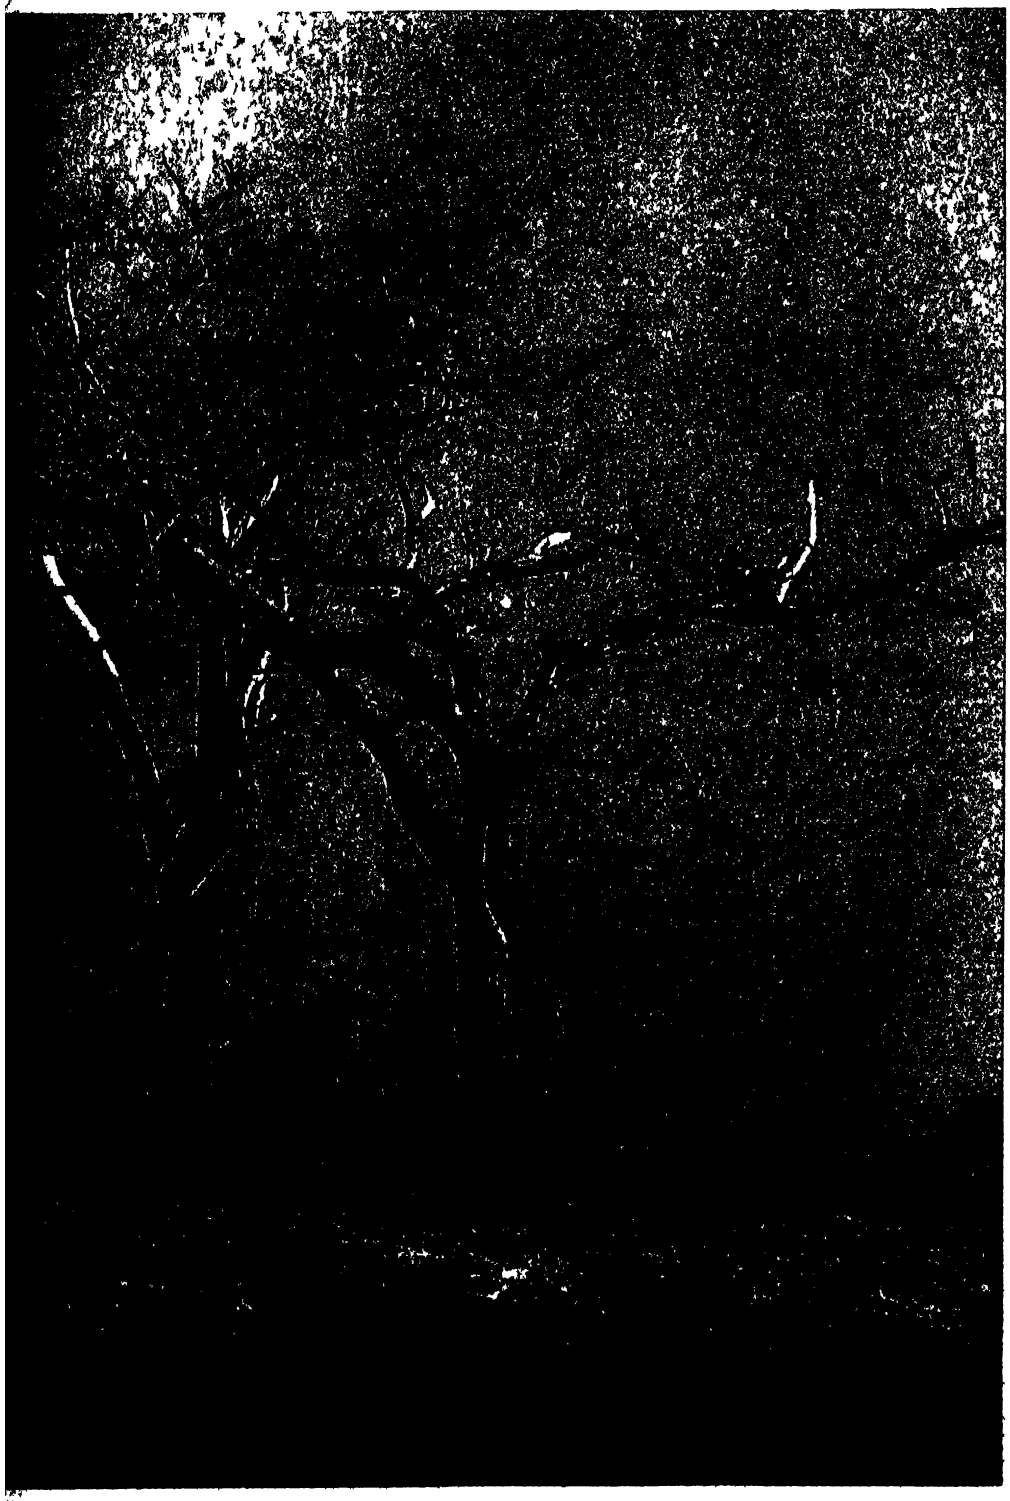
THE port town of Paradeep almost returned to normalcy with the clearing of the roads and the restoration of water supply. As of November 13, five of the eight berths were filled. "We have achieved 50 per cent utilisation and hope to achieve 100 per cent within 100 days," Port Trust Chairman Santosh Mahapatra told *Frontline*. He said: "There is marginal silting of the channels; where there should be 14 metres of water there is 12 metres. But this can be desilted soon. We are waiting for an improvement in power supply in order to load iron ore from the port plant. The damage to the port, estimated at Rs.65 crores, has not been much, considering that the port was set up at a cost of Rs.2,000 crores. What has been lost are the roofs of some godowns and office buildings, the electrical systems and 60 metres of the security wall around the port."

Electricity and water supply have been restored in most parts of Bhubaneswar. The animals in the Nandankanan Biological Park did not receive proper food and attention and as a result a number of camels are reported to have died. The Central zoo authority released Rs.20 lakhs for the immediate needs of Nandankanan. According to official estimates, Rs.4 crores is required to get the zoo back on its feet. With the cyclone destroying most of the bamboo shoots - the prime food for elephants - herds of elephants from the Wildlife Sanctuary are raiding villages such as Chandaka, Andharua, Kantaban and Jokalandi.

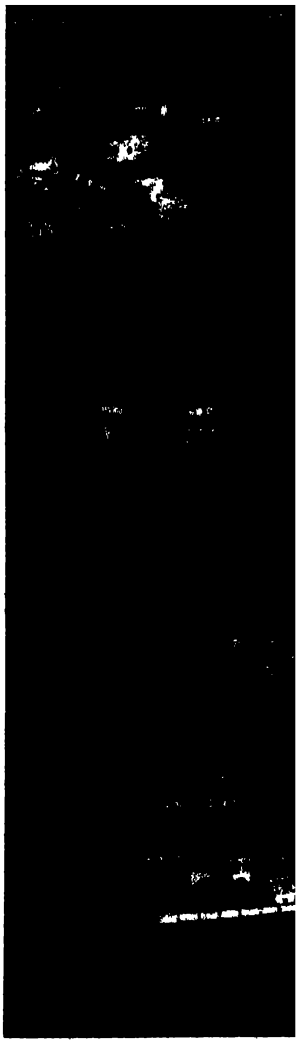
NOTWITHSTANDING the State Government's claim that no epidemic was likely to break out in the cyclone- and flood-affected areas as precautionary measures had been taken, cases of gastroenteritis, cholera and diarrhoea were increasing. Official reports stated that 35 deaths had occurred owing to diseases and that nearly 5,000 persons had been admitted to hospitals. Cuttack reported 22 diarrhoea deaths and two cholera deaths, and 987 people were afflicted by diarrhoea in the district.

On November 13, a Sadbhabana Health Care Team from Gujarat, consisting of 150 doctors, arrived in Bhubaneswar with medicines meant for distribution in the affected districts. State Health Secretary Meena Gupta said that besides health teams from other States, 311 doctors and 515 paramedical workers had been deployed to treat the victims. She also said that Orissa had received 106 truckloads of halogen and paracetamol tablets and intravenous fluids.

The Central Reserve Police Force (CRPF) was actively engaged in providing medical relief. It deployed eight medical teams, comprising medical and paramedical officers from New Delhi, Hyderabad, Jamshedpur and Durgapur, in Jagatsinghpur, Ersama, Astarang, Bhadrak, Cuttack, Kendrapara and Jajpur. These medical teams were also distributing drinking water. A team of international doctors supplied medicines required for one lakh people for a period of three months.



The United Nations has contributed in a big way. It has already provided medicine and relief materials worth $1.8 million. The United Nations Children's Fund (UNICEF) has provided 420 tonnes of medicines and other relief supplies. The World Food Programme, which had earlier promised $200,000, has increased the grant to $375,000. The U.N. Population Fund will provide assistance worth $170,000. The World Health Organisation will extend $100,000 in order to set up an emergency surveillance system to control epidemic.

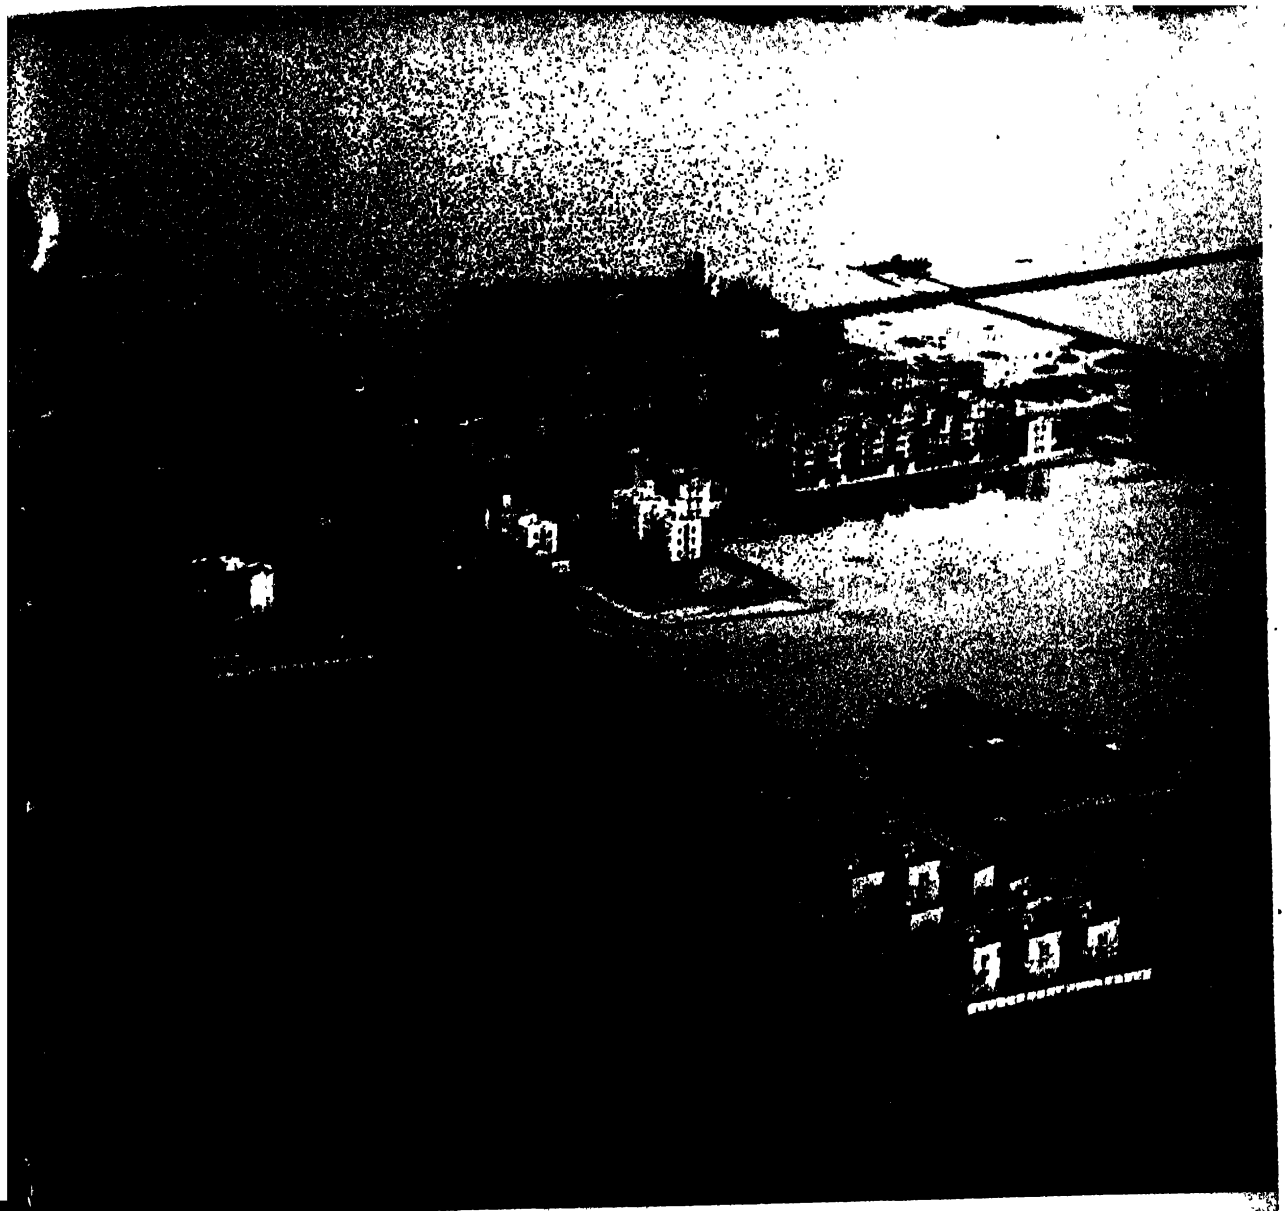


The previous Finance Commission had made provisions for a National Calamity Relief Fund, which would meet the requirements of a State in the event of a natural calamity of "rare severity". That fund has long been exhausted, but the Centre has nevertheless made available to Orissa more than Rs.500 crores by way of financial assistance.

Yet all these efforts may just not be enough to infuse life into coastal Orissa. With the State administration still grappling with the immediate problems of distributing relief materials and medicines and restoring public utilities, a detailed assessment of the damage to private and public property has not been possible. According to informed sources, when such an assessment is finally done, the financial burden may be awesome. "If in the final assessment 10 lakh houses are found damaged, Rs.5,000 crores would be needed to repair them at Rs.50,000 a house." This burden is apart from financial requirement to provide infrastructure such as roads, power lines and water supply installations. ■

DISASTER

AFTER THE STORM



PARTH SANYAL

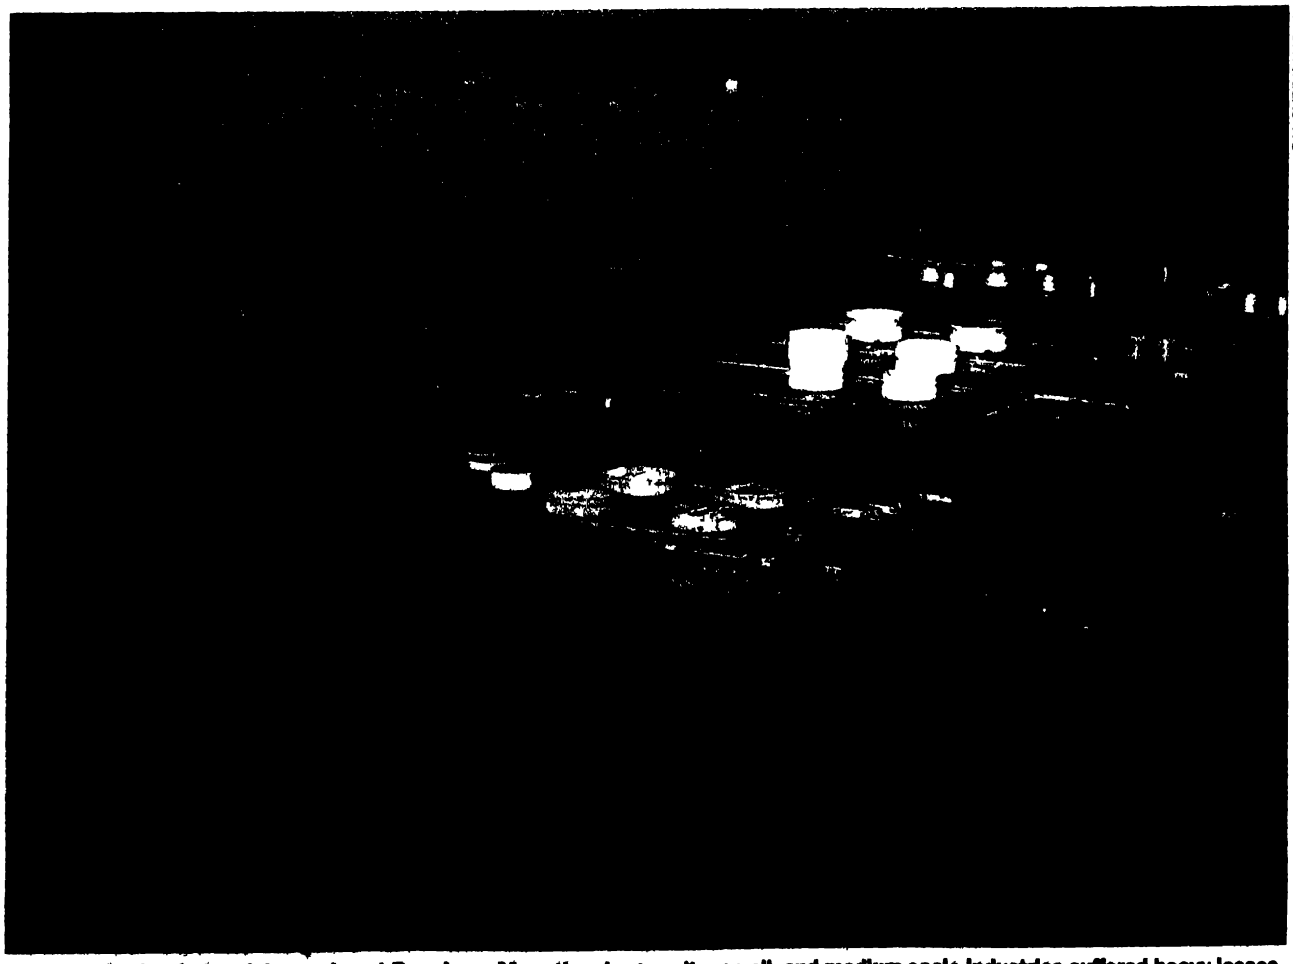
A crippled economy

The cyclone has hit Orissa's already parlous economy hard, and there are no reliable estimates of the losses in the various sectors even weeks after the disaster.

SANTANU SANYAL
in Orissa



ORISSA S economy is in a shambles There is hardly any sector that has not been hit hard by the October 29 cyclone No reliable estimates of the extent of loss were available more than two weeks after the disaster as the government agencies were concentrating their energies on the distribution of relief materials and the disposal of bodies However, preliminary projections indicated that the impact could indeed be enormous

On November 10, poultry farmers submitted a memorandum to Chief Minister Giridhar Gamang, drawing his attention to the damage caused to the poultry sector The memorandum put the loss, which included the destruction of birds hatcheries, feed mills and sheds, at Rs 40 crores According to preliminary estimates more than 1,000 poultry farmers, located mostly in the districts of Ganjam, Berhampore, Cuttack and Bhubaneswar, lost their means of livelihood Altogether, more than 15,000 people engaged in this sector have been hit

The resumption of agricultural operations may take time The total crop loss is estimated at Rs 1,750 crores The cyclone left more than 24 lakh hectares of farm land inundated About 15 lakh ha suffered a loss of between 50 and 75 per cent of standing crops In the absence of mechanised farming, the loss of draught animals – more than two lakh head of cattle have been killed – could hamper cultivation in future

Coconut and betel leaf cultivation has been badly affected Coconut trees on several hectares of plantations, mostly along the coast came down and betel leaf plantations in the districts of Balasore, Puri and Bhadrak were inundated The State, which produced a surplus of coconuts, will now have to depend on supplies from Andhra Pradesh Tamil Nadu and Kerala to meet its domestic requirement The destruction of betel leaf plantations entails a business loss of Rs 25 lakhs a day in Bhubaneswar and Cuttack alone Certain varieties of betel leaves grown in some pockets of Balasore district, which are exported, cannot be produced before six months

The cyclone also destroyed vegetable crops on one lakh hectares – 15,000 ha each in Puri and Jagatsinghpur, 34,000 ha in Kendrapara and 14,000 ha in

C V SUBRAMANYAM

What is left of an industrial complex at Paradeep. More than large units, small- and medium-scale industries suffered heavy losses

Cuttack. The average crop yield was eight to 10 tonnes a hectare. The damage to mushroom cultivation has affected 700 families in Nimapara (Puri district), Bhubaneswar and Khurda.

The State's rich dairy sector has also suffered severe losses Besides the death of milch cows and the destruction of dairy farms, a large number of chilling plants and more than 200 artificial insemination centres were damaged. At least 500 milk cooperatives need assistance to restart their operations. The Orissa Milk Producers' Cooperative Federation (Omfed), which collected more than one lakh litres of milk a day and supplied it to Bhubaneswar, Cuttack and Puri, among other places, will now depend on supplies of milk powder from other States to maintain normal deliveries. The daily collection of milk dropped to around 10,000 litres. Omfed is likely to procure milk from Andhra Pradesh and West Bengal.

The National Dairy Development Board (NDDB), in association with the Anand Milk Producers' Union, despatched 200 tonnes of milk powder and 200 tonnes of cattle feed. The NDDB also sent vaccines and life-saving drugs for animals.

According to the State Small and Medium Entrepreneurs Association, nearly 700 small- and medium-scale units, which employed about 70,000 to 80,000 people, have been devastated in Bhubaneswar and Cuttack. The figure is expected to rise when information from other districts arrives. The association has urged the State government to provide interest-free loans of up to Rs.10 lakhs to the affected units and declare a five-year moratorium on loan repayment by them. Units with a paid-up capital of more than Rs.10 lakhs should be helped with grants and soft loans, it said. About 400 small-scale and 24 medium-scale units that survived the cyclone were looted by anti-social elements, it said.

In the Paradeep port area, fishing activities have come to a standstill. About 300 fishermen were killed; nearly 60 per cent of the 11,000 country boats were destroyed, marking a loss of about Rs.24 crores. In addition, 2,500 mechanised boats and 400 trawlers sank, causing a loss of another Rs.30 crores. About 500 trawlers, mostly belonging to fishermen from Andhra Pradesh, sank at Paradeep port. The export of marine products from Orissa has hence suffered a setback.

ELECTRICITY supply and telecommunications services are yet to be restored in the 12 affected districts. Cesco, an undertaking of AES Corp, of the United States, had planned to give power connections to all applicants by November 14. The plan has gone haywire. AES Corp, which runs a power distribution system in eight districts of Orissa, has sought a tariff hike to offset the losses, estimated at Rs.300 crores. Cesco plans to appeal to the State government for compensation. If the government declines to oblige it, it will approach the State-level power regulatory authority, the Orissa Electricity

Paradeep's problems

SANTANU SANYAL
in Paradeep

THE Paradeep Port Trust (PPT) authorities knew what was coming, thanks to the Internet. They lost no time in taking measures according to a contingency plan formulated by the Union Government in the wake of the cyclone havoc at the Kandla port two years ago.

"We did not rely much on the forecasts by the Meteorological Department, which were general in nature. Instead, we started surfing the Net and at least two sites gave us a clear picture of the projected route, movement and intensity of the impending storm. We were on the alert," PPT Chairman S.K. Mohapatra said.

"Having lived in Paradeep for more than 30 years, we have learnt one thing: never take a cyclone warning signal lightly," Dilip Misra, PPT Traffic Manager, said.

The first priority was to force the berthed ships out of the port. There were six such vessels. Five of these were moved to mid-sea where the effect of the storm on them would be less severe. The vessels returned to the port after the Navy declared the navigation channel clear for traffic on November 6.

A sixth vessel, Spar Opal, which was loading steel coil, refused to sail out. Its moorings snapped and it was pushed from one berth to another, but it suffered no major damage. As it happened, the vessel's onboard satellite telephone system was the only means of communication Paradeep had with the outside world.

Eight vessels were waiting outside the port for berths. All but one left as soon as the cyclone struck.

No piece of major equipment at the port was damaged. Mohapatra said that the port authorities did everything possible to protect the equipment. The projecting parts of large equipment were lowered and fastened with bolts and the equipment was removed to safer places. However, some losses were inevitable. For example, the roofs of the transit sheds were blown off. Sea water damaged transformers and electric motors. Sand-casting has reduced the depth of the channel by about two metres: the channel has to be dredged. Navigational lights are gone, so are the pylons.

What has caused the most concern is the damage to the railway tracks between Rahama and Paradeep on the Cuttack-Paradeep section of the South Eastern Railway. The movement of bulk items such as coal and ore to and from the port has been hampered. Bulk items constitute more than 95 per cent of the port's traffic. Coastal shipment of thermal coal for the Tamil Nadu Electricity Board (TNEB) and other consumers could be resumed as nearly 2.5 lakh tonnes of ground stock was lying at the port. Thermal coal accounts for seven million tonnes of the port's total throughput of 13 million tonnes. The TNEB's share in the thermal coal traffic is more than five million tonnes.

The problem that coking coal importers such as the Tata Iron and Steel Company (Tisco) and Steel Authority of India Limited (SAIL) faced was even greater. The imported coking coal lying at the port premises cannot be evacuated unless the railway lines are repaired. To solve the problem, Tisco chartered a vessel to ship it to Haldia for onward movement by rail. Thus, part of the coking coal stock was shifted, though at a cost.

"We estimate the loss of port property at Rs.80 crores," Mohapatra said, pointing out that several private firms that undertook port projects on contract had complained of a combined loss of Rs.20 crores. "We will request the Centre to provide funds to meet the additional expenditure," he said, adding that the suspension of normal port operations entailed a loss of income of about Rs.60 lakhs a day.

At the Paradeep port. Ahead of the cyclone, the port authorities had almost all the ships moved out of the berths to mid-sea.

Rebuilding work to facilitate early resumption of normal operations took a back seat as the port authorities were forced to devote themselves to relief work. A large number of people living in shanties on port lands and the residents of villages close to the port were badly affected. Moreover, the port authorities had to coordinate the relief work undertaken by various government and non-governmental agencies. For this reason, they could not pay continued attention to the work on the Asian Development Bank-aided coal handling plant. The commissioning of the plant will now be delayed by at least six months.

Although the Navy deployed seven vessels and cleared the navigation channel, work could not resume. Even two weeks after the cyclone, Paradeep had no power supply. Since the public sector Paradeep Phosphates Ltd (PPL) was hit badly, the berth dedicated to it did not receive vessels.

Absenteeism, in view of the cyclone and the scare of ammonia leaks, was another factor that stood in the way of the resumption of normal work. Rumours of leaks in the PPL's ammonia storage tanks (the plant had released small quantities of ammonia in order to ensure the safety of the tanks) led to a virtual exodus of workers. Significantly, only one port employee died: he lived in a thatched hut, having sublet his official quarters.

Several fishermen living along the Paradeep coast were killed. Although not employed by the port, they used the fishing harbour, which is part of the port complex. As soon as the cyclone warning was received, the port authorities had urged the people living in the shanties in the port area to move under pucca structures. Most of them allegedly ignored the warning.

THE PPL bore the brunt of the cyclone. Its phosphoric acid and sulphuric acid plants were damaged. Between 5,000 and 6,000 tonnes of di-ammonium phosphate (DAP) worth about Rs.6 crores, stored in silos, was destroyed. The boundary walls of the plant and the township collapsed. Attempts were being made to resume DAP production in November itself. However, H. Mishra, Chairman and Managing Director, told *Frontline* that the acid plants would not resume production immediately. An assessment of the loss suffered by PPL would take time. The condition of the equipment would be known only after power supply was restored, Mishra said.

Mishra appealed to the Centre for special assistance. The appeal, it is learnt, has not gone totally unheeded. The Centre has before it a financial restructuring proposal for PPL. However, the sanction of grant would depend on the assessment of loss. As per the proposal, the accumulated loss of about Rs.256 crores would be knocked off from the book of accounts. The present equity size of Rs.214 crores would be reduced to Rs.2.14 crores and the loan of Rs.230 crores converted into equity. The interest on the loan too has to be waived by way of book adjustments. "Once the restructuring plan is implemented, PPL will start afresh, on a clean slate," Mishra said.

The loss suffered by the DAP plant of Oswal Chemicals & Fertilisers is put at Rs.100 crores. The two-million-tonne plant, estimated to cost Rs.2,000 crores, was due for commissioning in November. Now the commissioning has been deferred until January. Abhay Oswal, its Chairman, said that the exact extent of the loss would be known after the insurance company assessed the extent of the damage. The project's prime consultant, United States-based Jacobs, Humphreys and Glasgow, was involved in the assessment exercise.

The company, Oswal said, did relief work in 180 villages under 47 panchayats, with a total population of four lakhs. "We distributed about 1,000 tonnes of foodgrains and we will distribute another 3,000 tonnes," he said. Saris, dhotis and materials for shelters had also been distributed. The Oswals propose to spend Rs.10 crores on relief work and have involved their employees from all over the country in the operation. "We have a commitment to the people of the place where we have put up such a huge plant with so much investment," Oswal said. ■

Regulatory Commission, with a request to pass the burden on to the consumers. Power consumers are angry with Cesco's plan. The loss, they say, is largely owing to the failure of the company to insure its assets. Some consumers have threatened to take the matter to the streets. "Why should the consumers and the State government be made to pay for the loss suffered by a private concern," asked one consumer. Interestingly, some sections of the State government are for compensating Cesco suitably and have accordingly taken up the issue with the Central government. (see Column by Jayati Ghosh on page 76)

The loss to the telecom circle is estimated at Rs.50 crores, with a large number of telephone exchanges washed away and microwave towers – at Nimapara, Paradeep, Kakatpur and Jajpur – uproot-

ed.

The local chambers of commerce have estimated the loss to industry, big and small, at Rs 500 crores They emphasise the importance of early normalisation of the affected units This process could be accelerated if an interest holiday is declared for one year on loans issued by commercial banks, according to them. They also want the repayment period should be extended Fresh working capital should be made available to industry at a concessional rate and the requirement of margin money on fresh loans should not be insisted upon, the chambers have suggested

Following the cyclone havoc, the Reserve Bank of India and the Union Finance Ministry directed all banks to provide immediate assistance to the affected people to help them raise new crops and purchase farm implements, seeds, fertilizers and insecticides Banks and other financial institutions were told to extend loans to rebuild houses

The State government has sought a Central assistance of about Rs 350 crores to reconstruct about 1 2 million dwelling units. It has also urged the authorities concerned to build houses under the Indira Awas Yojana The Housing and Urban Development Corporation (HUDCO) has announced that it would provide Rs.187.5 crores towards the reconstruction of about 75,000 dwelling units

Sharda Singh, Chairman and Managing Director of UCO Bank and convener of the State-Level Bankers' Committee (SLBC), led a team of senior bankers and top executives of financial institutions to Orissa and held meetings with the Chief Minister, the Finance Minister, the Chief Secretary and other senior officials in order to assess the kind of assistance the banking sector would be required to provide to raise new crops, rebuild houses and restart businesses and factories in the small and medium sectors The Government at that time did not have a correct estimate of the losses or the kind of assistance that would be required These aspects are likely to be finalised at an SLBC meeting in the near future.

Another factor causing concern is the financial situation of the State government. Doubts have been expressed in certain quarters that the money received for relief and rehabilitation might actually be used to pay the salaries to government employees. The critical financial situation of the Government had earlier forced the RBI to clamp restrictions on overdraft. The restrictions have since been lifted. ■

■ COLUMN

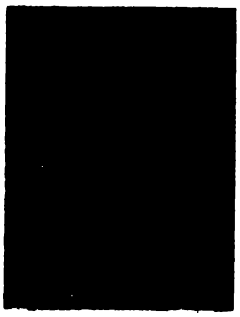
Cyclones, power and social responsibility

A multinational company seeking to triple power tariff in already suffering coastal Orissa, claiming that the cyclone has hit its facilities, which had been left uninsured, raises questions regarding the rationale for and pattern of privatisation in the country, and consequent monopolistic practices that impinge on the lives of ordinary people.

THE cyclone that ravaged the coast of Orissa was one of the worst to affect the subcontinent in this century The scale of devastation that has occurred is unimaginable already the official death toll is close to ten thousand people, although the situation has been so dire that no formal enumeration of the dead has yet been undertaken More than 20 million people are said to be affected, and agriculture and industry in the region have been ravaged

Around ten lakh houses are said to have been damaged, many beyond repair, as well as more than 30 lakh *kutcha* houses, rendering millions of people homeless Nearly three lakh farm animals were killed, the extent of the crop area affected (with standing crops destroyed) exceeds 12 lakh hectares, and preliminary estimates of property loss range upwards of Rs 1,000 crores

Calamities as extreme as this will take years if not decades to recover from, even in terms of the most minimal reconstruction and repair. Quite apart from the enormous loss of human life, simply replacing physical infrastructure in a State that was already one of the most absolutely poor and backward in the country is a task of huge proportions. The enormity of the requirement of providing immediate relief has clearly exposed both public and private agencies as being inadequate, and lakhs of people in at least nine districts continue to be in great distress, deprived of the most basic amenities and sometimes even of the means of survival



In the wake of such a major disaster, the natural expectation is that all sections of society, especially those with the finances to make a difference, would step forward to contribute to the recovery and reconstruction effort This expectation is even higher *vis-a-vis* large industrialists and multinational companies (MNCs), which are increasingly prone to publicise their sense of "social responsibility" This is why some recent news reports of the response of at least one multinational company comes as a shock, even to hardened critics accustomed to expecting the

SHERWIN CRASTO/ AP

Lineemen repair power cables in Jagatsinghpur, two weeks after the cyclone.

worst from such quarters.

JAYATI GHOSH

ACCORDING to a news report in a major national newspaper (*The Indian Express*, November 11), a major multinational company which owns majority share in the power transmission and distribution company supplying the coastal districts, has demanded full compensation for its losses from the government, failing which it would triple the cost of electricity to consumers in the affected areas.

The United States-based multinational AES Corporation currently holds 51 per cent of the stock of the Central Electricity Supply Company (Cesco), which supplies power to consumers in the affected coastal districts of Orissa. The president and chief executive officer of AES, Dennis Bakke, came to India to review the post-cyclone situation, and apparently discovered that Cesco had sustained losses of around $60 million (Rs. 300 crores) due to the cyclone.

As a result, said Bakke, the company was asking the Government of India to bear the losses. If it refused to do so, Cesco would be forced to approach the relevant price-setting body, the Orissa Electricity Regulatory Commission, for a tariff revision which he estimated could be as much as three times the present tariff. Obviously, the company felt that if the government does not share the burden, then the people would have to bear the cost.

In the wake of the cyclone, many public and private companies have declared concessions to the affected people, who are already reeling under very adverse material circumstances. Thus, the Department of Telecommunications has announced special concessions to consumers in the region. In the case of electricity, the supply of which has been so badly disrupted, it would be expected that consumers who are already suffering because of no or low provision would at least be spared the burden of higher prices. Indeed, total restoration of earlier levels of electricity supply in the affected districts is expected to take as long as six months.

However, any such concessions are obviously not under consideration by Cesco. Bakke argued that the company is under financial stress because of poor revenue collection, making it difficult, in the management's assessment, to give any relief to consumers. Perhaps more significantly, there is no legal obligation for the company to do so. The majority shareholding in Cesco was purchased from the public sector Power Grid Corporation of India Limited, which continues to hold 49 per cent of the shares.

Under the terms of the agreement of sale, there was no contractual provision about covering its losses arising from any calamity. Further, remarkably for these obsessively risk-averse multinational companies, no disaster insurance cover had been taken for any such eventuality; in fact, the company claims that it was in the process of taking out insurance on its infrastructure when the cyclone struck. Since it had clearly been inefficient in insuring itself in time, it would choose instead to make its customers – including some of the poorest people in the world living through a major catastrophe – pay for its lapse.

EVEN if we set aside the inevitable knee-jerk reaction that this is likely to evoke in terms of the perfidious behaviour of MNCs, there are some important issues that arise in this context. The first issue relates to the whole pattern of privatisation of the generation, transmission and distribution of electricity that has accelerated in many States in recent times. Many observers have noted that in several States this process has been characterised by a piecemeal approach, vagueness, secrecy and lack of transparency in the legal follow-through, and a tremendous lack of public participation and therefore of democratic accountability in the final institutional framework that has resulted.

The haste to privatise came from a perception that public sector companies were unable to deliver not only because of bureaucratic interference but also because they could not be professional in their approach in terms of efficient provision and recovery of costs. But the pattern that now seems to be followed in many cases in this sector is that private investors (usually multinational investors) will pick up all the profits (in some cases, even guaranteed profits) while the government exchequer bears all the risks. So taxpayers end up funding even though the essential idea inherent in private entrepreneurship is that profits are rewards for risk-bearing.

It is now apparent that another source of trouble in dealing with natural monopolies such as electricity provision is that when the private sector is given control then monopolistic practices are also much more likely. In such circumstances, at the very minimum, the regulatory devices need to be very carefully specified and comprehensive. But this is clearly not so yet in India.

The current experience in Orissa illustrates one way in which this can become extremely problematic. In this case, the people of the State, especially in the coastal region, seem to have lost out because of the electricity companys attempt to make them pay for a major natural calamity which has already caused them huge dispossession. The State Government has lost out because it does not get the advantage of revenues even as it is forced to take on losses if it does not want consumers to be charged more. It is difficult to understand, therefore, why the entire process was necessary at all.

The entire privatisation process has been sold to the country on the argument that this would help the government get out of things that the private sector can do better so that the government can concentrate on what the private sector will not do. This episode shows that like so much else in the language of liberalisers and of globalisation, there are poignant gaps both in language and its interpretation in reality, which can be appropriated by those in power.

Perhaps this is why Union Power Minister P. Rangarajan Kumaramangalam, talking about power and the Orissa cyclone in a conference involving the Central Electricity Regulatory Commission and the United States Energy Association on November 2 (*Business Line*, November 3) could offer no more wisdom than that the Orissa Electricity Regulatory Commission and the privatised distribution and generation companies "will have a challenging task ahead of them in the reconstruction of the State with a human face".

That statement was made before Bakkes made his comments quoted above. If the past and present practice of post-liberalisation governments is any indication, it is possible to predict that the face of the present BJP-led Government will be much more "human" to multinationals than it is towards those Indians who happen to find themselves in a crisis as in Orissa. ■

Towards e-governance

Implementing e-governance in the country may be a long way off, but some States are making efforts to move in that direction.

ANUPAMA KATAKAM
in Bangalore

NO country can today afford to avoid keeping pace with the growth and spread of information technology, let alone ignore it. No wonder then that the Indian Government is trying to build its own computer networks, which will perhaps usher in in the new millennium an administration that is organised and effective in providing the citizens services that are long overdue.

Electronic governance appears to be the keyword today in most administrative departments. And now, with a Ministry for Information Technology formed in the Union Government, the concept of government departments becoming fully computerised might actually work. At a recent national conference on e-governance (as it is called) in Bangalore, IT Secretaries from 32 States and Union Territories participated in discussions which led them to announce that they were "committed to providing a one-stop, non-stop, efficient, effective, responsive, transparent citizen governance through the use of information technology."

Nevertheless, the outcome of the three-day conference was disappointing. Held against the backdrop of BangaloreIT.com, a five-day international exhibition on computers, the conference was attended by the country's who's who in IT. That being the case, a more significant "declaration" was expected. However, the decisions were bereft of specificity, and the plans lacked timeframes (see box).

Apart from networking government departments, e-governance throws up several questions of transparency, accountability, technology and logistic feasibility, of whether these will benefit the common man. *Frontline* spoke to officials and experts on some of the issues that surround this concept.

ELECTRONIC governance is used as a synonym for an information technology-driven system of governance that works better, costs less and is capable of servicing people's needs. It is also broadly defined as the use of information technology for efficient delivery of government services to the people and to business and industry. A double-pronged term, e-governance involves the computerisation of government departments and the networking of all government departments, and linking them, as also district and taluk offices across a state, with the State headquarters.

According to Karnataka's IT Secretary Sanjoy Das Gupta, the objective of electronic governance in India goes beyond mere computerisation of government offices. It fundamentally means changing the way the government operates and implies a new set of responsibilities for civil servants, businesses and the public. According to him, plans such as online services will give the average citizen access to government services, with faster responses at more convenient hours. These services include providing information, collecting taxes, granting licences, administering regulations, and paying grants and benefits.

It may seem almost impossible to revolutionise India's bureaucracy which is notorious for its red tapism, but projects have already been successfully executed. Andhra Pradesh went high-tech to a considerable extent almost two years ago, and Kerala follows close behind. Karnataka has ambitious plans in this regared; Chief Minister S.M. Krishna has promised to put them into effect in two years' time.

SAGGERE RAMASWAMY

At a railway reservation counter. The Railways have proved how computerisation can revolutionise a public utility.

Announcing some of Karnataka's plans, Krishna said at the inauguration of the conference that every Deputy Commissioner, Superintendent of Police, and chief executive officer of zilla parishads would be provided with video-conferencing facilities by December. The government plans to provide a computer laboratory and Internet connectivity to every high school; however, no timeframe has been specified. Five per cent of the Plan budget for every department will be earmarked, for a period of five years, toward promoting IT development in its offices. The Chief Minister also said that a bottom-to-top approach should be taken. "The less fortunate and ordinary man needs to be helped immediately," he said.

ANDHRA PRADESH IT secretary R. Chandrashekhar asserted that the ideas would work; he said his State government had proved that the plan could

make a difference to the ordinary people. "It is not just for the literate and the well-to-do, but also for people who need information about, say, housing schemes or rants available," he said.

Andhra Pradesh has already implemented four programmes. The Computer-Aided Administration of Registration Department (CARD) project was the first to be implemented. It ensures efficiency in the registration of documents, by providing help in ascertaining the market value of property and calculating stamp duty, transfer duty and registration fees. The project is likely to cover about 29,000 revenue villages in 23 districts. "Previously it used to take days, even weeks, to get information; now it takes between 10 and 30 minutes," Chandrashekhar said.

On November 1, 1999, the State's Formation Day, Chief Minister N. Chandrababu Naidu launched the video-conferencing facility in the State, linking most of the districts to the State capital, Hyderabad. Known as the Andhra Pradesh State-wide Area Network (APSWAN) and the Andhra Pradesh State Secretariat Campus Network (APSCAN), the projects had been in the pipeline for quite sometime. APSWAN is envisioned as the backbone network for voice, data and video communications throughout the State. In the first phase, Hyderabad was linked to Vijayawada and Tirupati besides 23 district headquarters using 2 Mbps fibre optic links provided by the Department of Telecommunications (DoT). APSWAN will eventually be extended to all mandal headquarters and then to all villages in the State, Chandrashekhar said. The Local Area Networks (LANs) that are in operation in various government offices will be linked to APSWAN while all offices in the State Secretariat have been connected to various district headquarters through APSCAN. Eventually, all government offices in the State capital, the District Collectorates and the various offices at the district level will become part of the network. Approximately Rs. 100 crores will be spent over a period of five years for the project.

The TWINS or Twin Cities Network Services Project will operate a chain of integrated Citizen Service Centres. Chandrashekhar said that the aim was to integrate all the administrative services and make it a single office ultimately. Whether one wants to get a driver's licence or to make a payment, it can be done at a single window at these centres. Currently at the pilot stage, the project will start with 20 services from six departments. The State government hopes that these service centres will eventually grow in numbers, like public telephone booths. This will generate more employment opportunities and put at rest any notions that technology will cause retrenchment, he explained.

Chandrashekhar said that Andhra Pradesh was able to establish a high level of connectivity across the State with the assistance of the Department of Electronics (DoE). Therefore, it will not take long for all the districts to be connected. He expects that the project will be implemented in about six months' time.

KERALA launched a Rs.43-crore Information Kerala Project last year. This will computerise and network relevant applications for 1,214 local bodies, Kerala's IT Secretary Aruna Sundarrajan said. Starting at the local level, they had developed software for the payment of welfare pensions, she said. A citizens' database has also been created by local bodies and elected panchayat members. Easy access is a key factor, however. The database can be used to procure information on building licences, licence fees and taxes. People living in rural areas can find out what quotas they are entitled to, what schemes are applicable to them, or, in the case of land records, where they are located and whom to contact. "E-governance is going to benefit the common man only when he walks into a government office and finds that he does not have to wait in a line for licence renewal forms or that payment does not mean running from pillar to post," she said.

Aruna Sundarrajan said that in Kerala, the IT work completed so far included the linking of 152 development blocks to a networked computer project. The network provides electronic mail identities for each block and helps monitor projects at the block level. All treasuries/sub-treasuries in the State will be connected by next month. Three treasuries, five sub-treasuries and extension counters in Thiruvananthapuram district are already online. In addition, work on the Secretariat Wide Area Network (SWAN), linking the offices of Ministers, secretaries and State departments, is under way, according to her.

PROFESSOR Roddam Narasimha, Director, National Institute for Advanced Studies, told *Frontline* that "to be completely effective, e-governance needs to have a strong infrastructure." Presenting a paper on "E-governance - A Blueprint," he said network and connectivity in the country were relatively poor, but as India had the technical skill and know-how in the field there was no excuse for not achieving goals. Moreover, he said, DoT had good fibre optic cables that would be used for electronic transmission. "Begin with them and continue finding solutions," he said.

Narasimha believes that computer accessibility is possible if a computer that can be made widely available is built. Unless computers reach every section of the population, e-governance will not work, he says. Half the components that are offered in computers today are not needed by the average customer. If we can make a computer without the frills – one

The declaration

The following is the declaration made at the conclusion of the national conference on e-governance:

1. The focus of governance has to shift from being "government centric" to "citizen centric".
2. Information technology (IT) provides an opportunity for large-scale delivery of quality services.
3. The use of IT must facilitate efficient delivery of government services to citizens and business. The goal is to provide services to anyone, anytime, anywhere through a variety of channels at a reasonable cost.
4. There is a need to re-engineer the process of government in order to achieve synergy with IT.
5. Human resource development of the existing workforce in order to inculcate appropriate skills and attitudes is a critical factor.
6. Government, industry and community must join hands in e-delivery of services, especially in social sectors.
7. A sound communication infrastructure is essential for ubiquitous access.
8. A conscious effort should be made to harmonise IT with regional requirements.
9. IT should be innovatively used to ensure that no section of society is deprived of the benefits accruing therefrom.
10. The Central Government should provide support for capacity building in IT in the States. ■

Technology options

ANUPAMA KATAKAM

THERE are several technology options available in order to instal a complete computer network in a State. Dr. N. Chandrasekharan, Director, Centre for Development of Advanced Computing (C-DAC) has done a study on the computerisation of government departments in Andhra Pradesh. The following are some of his observations:

* Video conferencing is going to become obsolete. State governments should wait for wireless technologies which have been very successful in the United States and in Europe.
* Extremely high bandwidths are required for networking, and until the necessary infrastructure is installed, governments should not embark on computerisation. "For e-governance to succeed, a citizen should become a netizen by being able to garner uninterrupted and sumptuous bandwidth."
* In the last three decades, the world has moved away from Cobol-based solutions to Client-Server, and now to Network Centric Multi-tier solutions.
* A database server will help as it acts as a central source of data access for a group of end-users, which can vary from a small number to thousands. When several users access the same data source, rules must be established for reading, inserting, deleting and updating data records in order to guarantee the integrity of data.
* When one moves from mandal level to district level to State level, users will need to be able to connect to local databases, remote databases and Application Server databases, by specifying database names. A system administrator will be required to provide assistance with the System Database directory.
* Security is among the most important concerns. Access to data is controlled at many levels. Typical database users need to be configured in order to be grouped under database administrators, system administrators, transactional processing personnel and decision support users. The access privileges also vary.
* Technology is a double-edged sword. It is a vital tool but it can also cause immense harm. Users along with developers will tamper with the system. Security, in fact, should be a primary concern.
* Governments have to learn to digitise documents quickly and effectively. That way information will be easily accessible.
* Finally, it is step-by-step procedure. Governments have to rehaul the physical system of the administration and also to rethink the strategy and the whole philosophy behind administration. ■

that costs between Rs.5,000 and Rs.10,000 and has only word processing, a modem that provides access to the network and the ability to calculate along with the option of using it in an Indian language – the demand will be in millions and State governments will have the answer to the present predicament, he explains. "Make the information user-friendly, computers widely available, perhaps place them in schools and colleges, and even the most computer illiterate will be able to access information."

Time-frames to implement electronic governance are short, Narasimha says. The entire network can be in place in two years, and it is not terribly expensive. He estimates that it would cost Rs.150-200 crores to interconnect all large towns in a State like Karnataka. India, he says, is ready but needs to untangle its bureaucracy.

Although Narasimha is not part of the official task force, the government often consults him on technology-related issues and policies. A larger issue, he says, is the disparity between the village and the city. Once the villager or even a less fortunate citizen who lives in urban areas but have had no education is made aware of his rights, public pressure will mount and the government will have to take steps to make information readily available, according to Narasimha.

When the people learn that at the push of a button, they can access information on developmental works, court documents, ration quotas, licences, poll lists and land records, and pay bills, they will understand the value of information technology.

Speaking on the fundamental concepts of e-governance, Dr. N. Chandrasekharan, Director, Centre for Developing and Advanced Computing, said that the core of e-governance was eliminating middlemen and corruption. Once people know that information could not be monopolised, they would demand access to it.

Chandrasekharan does not believe that the Central or State governments are handling the technology in the right way. He feels that the Indian government is ill-prepared to face the "revolution", as he calls it. "Those who make policy do not consult scientists and technocrats. Unless they hold discussions with the architects of the system, the most appropriate tools in advanced technology will not be used, he said.

Private industry may be able to bail the government out but it must always be kept in mind that where there is profit to be made, the best interests are not always looked after. Chandrasekharan, who argues that the most powerful technology may not installed, says that in that case India will never be able to exploit the full potential of information technology without the advice of scientists.

The best technology, according to Chandrasekharan, is Web-based. "Without Web connectivity, any plans for e-governance is a non-starter." He pointed out: "It is an overwhelming task to put everything online, and although the government has started discussions and a few pilot projects, I don't think the government realises the scale."

While the task may be huge and India has a long road ahead, the silver lining, as Chandrasekharan and other officials pointed out, is that there appears to be a will and a desire to seek change. The first hurdle, they said, was the mindset. Once people within the government and outside it realised the benefits, there was and is a positive attitude to using technology. The Railways, they say, are a standing example of what computerisation has done for the people.

Even if the resistance to technology is fading, implementing electronic governance in India as a whole could still be far away. Some of the concepts even appear utopian. After all, will a peasant in a remote village whose land records have been stolen be ever told that his documents are available in a machine? Yet if e-governance works, it might open an era in the country. Transparency, accountability and the right to information will change the nature of government functioning. ■

The question of nuclear yield

BARC scientists present the proof.

In the wake of the five nuclear tests at Pokhran on May 11 and 13, 1998, some questions were raised about their yield levels. Some Western seismologists said that the total yield of the three explosions on May 11 was between 10 and 15 kilotonnes, while that of the two tests on May 13 was 100 to 150 tonnes. Then doubts were raised about whether one of the three devices exploded on May 11 was really a thermonuclear device, or a hydrogen bomb as it is called. In response, Dr. R. Chidambaram, Chairman, Atomic Energy Commission (AEC), and Dr. Anil Kakodkar, Director, Bhabha Atomic Research Centre (BARC), asserted that the total yield of the five explosions was around 60 kilotonnes. (*Frontline*, June 9, 1998 and January 15, 1999). Dr. Chidambaram and BARC scientists also asserted that it was a thermonuclear device that India had exploded.

In October 1999, questions were raised about whether the two sub-kilotonne tests on May 13 had fizzled out, that is, whether the explosion had occurred at all. *The New York Times* wrote in October 1999: "Had India faked explosive tests? Were they flops? Or had small blasts eluded the eavesdroppers?... Though opponents of the treaty point to the Indian claim as a test ban embarrassment, the emerging consensus among nuclear experts is that what failed that day was not global monitoring but the pair of explosive devices."

In January 1999, in an article titled "Nuclear Energy in India," Dr. Chidambaram stated that the sub-kilotonne devices, whose yield is less than one kilotonne (1,000 tonnes), were also fission devices. But designing a sub-kilotonne device was more difficult than designing a standard fission device. "In a sub-kilotonne device... where one goes marginally super-critical, one cannot afford to make a mistake. In the case of a mistake, one may have a fizzle. In the case of the May 1998 tests, all the three sub-kilotonne tests gave a perfect match between the calculated and the measured yields, which is important. In case one signs the CTBT, one cannot carry out tests, which release any nuclear yield. If one can predict accurately the yield of a device whose yield is only a few hundred tonnes, one can also guarantee the design of an experiment where the fissile material in its optimum configuration will go close to criticality and still stay sub-critical. Thus, our sub-kilotonnes tests have also given us a capability to carry out sub-critical tests, if we consider them necessary. We have, however, no plans at the moment to carry out sub-critical tests..."

In order to sustain an informed debate on the subject, *Frontline* reproduces here an article written by scientists of the Bhabha Atomic Research Centre, Trombay, in *BARC Newsletter*, September 1999. The authors of the article are **R. B. Attarde, V.K. Shukla, D.A.R. Babu, V.V. Kulkarni and Anil Kakodkar.**

THE five nuclear tests conducted during May 11-13, 1998 at Pokhran included three sub-kilotonne devices, in addition to a thermonuclear device and a standard fission device. One sub-kilotonne device was tested on May 11, while on May 13, two sub-kilotonne devices were tested. This report gives some of the results of gamma radiation logging measurements in bore holes at the sites of the sub-kilotonne tests as well as the post-shot radioactivity measurements on the samples extracted from these sites.

Gamma radiation logging

Gamma radiation logging was carried out in the bore holes drilled at each of the test sites. The equipment used for this purpose was developed at the Radiation Safety Systems Division, BARC. The equipment consisted of a measuring unit and a detector probe unit that were coupled by a long cable wound on a cable winch. The main detector probe consisted of two energy-compensated Geiger-Mueller (GM) tubes. It covered six ranges, from 0-2 microGray to 0-200 milliGray. (The actual ranges were 0-2 microGray, 0-20 microGray, 0-200 microGray, 0-2 milliGray, 0-20 milliGray, 0-200 milliGray.)

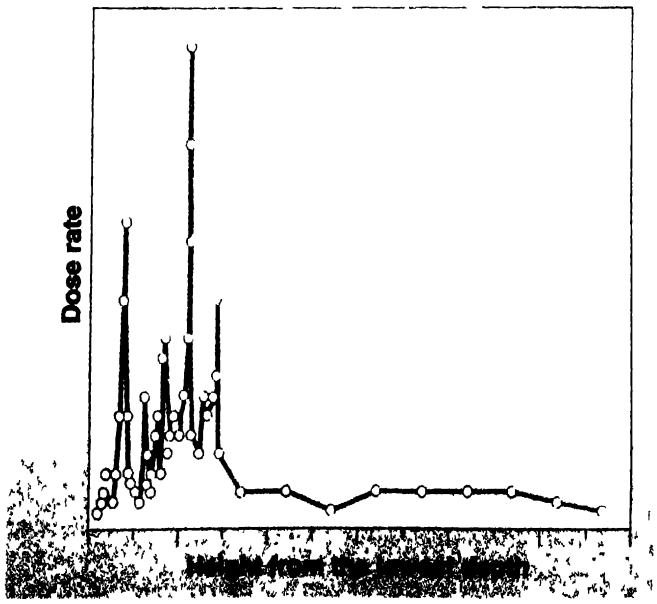


Figure 1. The gamma dose rate at the test site of the 0.5 kilotonne device on May 13, 1998.

The real story. Every time

The measuring unit incorporates necessary high voltage supply for detectors, a count rate meter, scaling circuits and an audio circuit All the readings were displayed by the linear 50 division meter. The audio facility was quite useful in monitoring the health of the instrument during logging Before and after each logging, the instrument was checked with a test source The instrument was initially calibrated at the BARC for all the ranges – at different points in each range – using various source strengths

These measurements have shown the presence of gamma emitters at all the test sites Figure 1 gives the variation of gamma dose along depth at the test site of the 0 5 kilotonne device

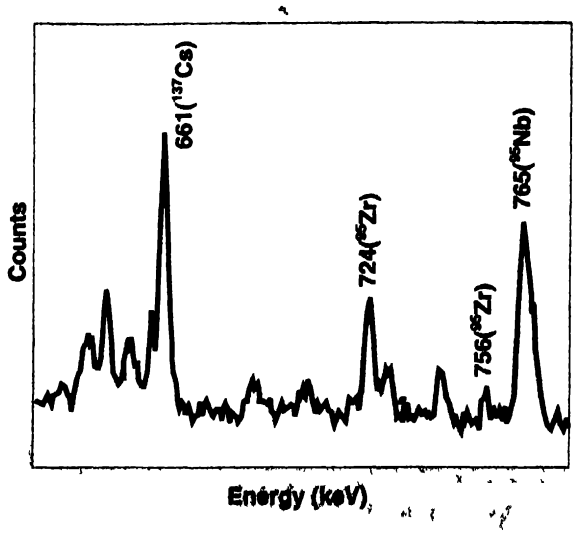

Figure 2. The gamma spectrum of a sample from the test of the 0.3 kilotonne device.

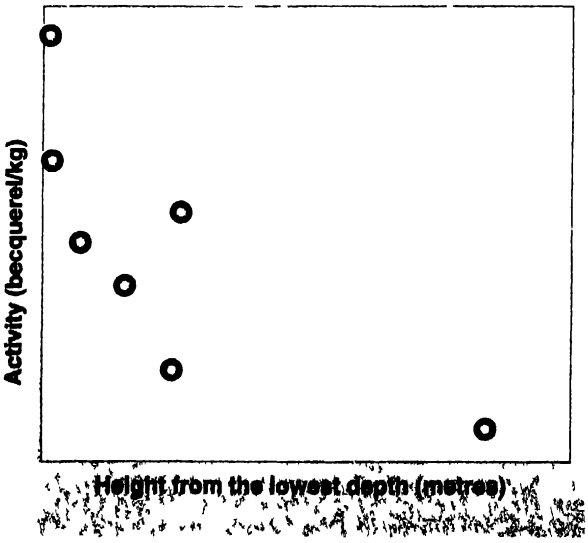

Figure 3. Variation of ^{137}Cs activity with depth for the 0.2 kilotonne device.

Identification of radioactive species

The samples extracted from bore holes at all the test sites were assayed for radioactivity content at the Environmental Assessment Division of the BARC The samples were powdered and dried. The homogenised samples were stored in plastic containers of 8 cm height and 7 cm diameter each For the assessment of radionuclides, two high resolution gamma-ray detectors with efficiency levels of 20 per cent and 30 per cent with respect to a 7 5 cm x 7.5 cm thallium-activated sodium iodide detector (a versatile detector for radiation) coupled with a multi-channel spectrometer consisting of 8,000 channels, were used. This detector is capable of giving a high-resolution spectrum. Europium-152 sources (as gamma radiation) were employed as standards for efficiency calibrations of the detectors in the specified geometry.

Figure 2 gives a typical gamma spectre of a sample collected from the test site of the 0 3 kilotonne device. The spectra clearly show the presence of fission products such as Cesium-137, Zirconium-95 and Niobium-95. These isotopes are otherwise not present in nature. Their presence in samples is a signature of nuclear fission.

Figure 3 shows the variation of ^{137}Cs activity with height, from the lowest point at the test site of the 0.2 kilotonne device. ■

On matters of style

WILLIAM SAFIRE

On November 1, the president of the United States lost his capital. This is not about the burning of the Executive Mansion by the British on August 24, 1814, just after James Madison took flight from the nation's capital and his wife, Dolley, cut the Gilbert Stuart portrait of George Washington out of its frame and took it with her for safekeeping.

Rather, I refer to the recent Triumph of the Lowercase (or, as we are now encouraged to put it, the triumph of the lowercase). In the latest, eagerly awaited *New York Times Manual of Style and Usage* – subtitled (curiously, all in initial caps) "The Official Style Guide Used by the Writers and Editors of the World's Most Authoritative Newspaper" – the capital letter is decisively taken down.

We are guided: "It is *President Lamm* (without a given name) in a first reference to the current president of the United States." Note: not "the current President," with a capital *P*.

From now on, even when referring to the specific person holding the highest office in the nation, *Times* style is to lowercase the *p*. The Associated Press stylebook has been doing this for decades (which is why I sometimes refer to the a.p.), but I like the respect shown to the particular president marked by the capital *P*. My preferred style, no longer stylish: "'This is an attempt to bumfuzzle,' said the President."

The same lowercasing is in store for *founding fathers* (an expression coined by Warren G. Harding, the 29th president). *The Times* further suggests desexing the alliterative phrase to *founders*, though I can't think of any who were mothers. Inconsistently, *The Times* holds fast to the capitalisation of *Fourth Estate*; that's got to go.

So it's "God save the king", not "the King". Speaking of God, the faithful will be happy to see that the Supreme Being retains his capital. But note that I just wrote "his capital" – lowercase *h*, not "His capital" or, as some would insist, "Her capital". *The New York Times* stylebook entry: "God (Supreme Being). Lowercase *he, him, his, thee, thou, who* and *whom* when the reference is to God, Jesus, the Holy Ghost (or the Holy Spirit) or Allah."

I go along with this judgment, though I may pay for it on judgment day, because of a parenthetical remark in a letter written in the last century by Herman Melville to his literary mentor, Nathaniel Hawthorne: "You perceive I employ a capital initial in the pronoun referring to the Deity; don't you think there is a slight dash of flunkeyism in that usage?"

Signs of the times can be seen in the entries dropped and added between editions of the stylebook. Gone are *Molotov cocktail, women's liberation, monkey wrench, Novocain* and *zymurgy* (a word for fermentation that hasn't been used or abused in decades). In are *voice mail, postmodern, euro* (that unified currency is lowercased, though *Eurocurrency* is not, to differentiate U.S. dollars held in European banks), *feng shui* and *into the breach*.

About that last: Apparently, too many reporters have been using that phrase instead of Shakespeare's "Once more *unto* the breach." And the Bard's usage is also neatly defended in the entry for *gild the lily*: "An accepted phrase for overembellishment, but writers who wish to delight the exacting reader will *use* Shakespeare's actual words, from '*King John*': 'To gild refined gold, to *paint the lily*.'"

I think Allan M. Siegal and William G. Connolly, authors of the new stylebook, had this column in mind on *gilding the lily*, because an exacting readership is what I've got.

In jocular jousting with the arbiters of style in New York, I win a few and lose a few. *Speechwriter* is now a solid word, and *catalog* no longer ends in *ue*. *Data* is now accepted as singular, and I'm thinking of starting a fight about *media*, which should be as singular as *fourth estate*. (If the copy editor has capitalised that, I've been sabotaged.)

The first entry I turned to was *American Indian*. For years, I have been insisting that I am a *native American*, having been born in the United States, and resisting the seizure of that compound by aboriginal Americans.

The Times says that "American Indian(s) remains the most widely used term for the native people of North America" and notes that *Native Americans* is rejected by some Indians because the U.S. government uses the term to include Eskimos, Aleuts, Native Hawaiians and Pacific Islanders. The book's solution: Use the term preferred by the people written about.

Fights I have lost so far: *Ms.*, though not an abbreviation, takes a period. Nicknames, at least those for bad guys, are still in parentheses, not quotation marks, and so I cannot refer to Willie "the actor" Sutton's nocturnal pioneering in automatic teller machine withdrawals. *Pee* is still disallowed (show me a little kid who asks to urinate), and *versus* is still preferred to *vs.*, though *v* is OK for court cases. Even though my word processor defaults to *stories*, that word is frowned upon except at bedtime: "The preferred word for a newspaper or magazine report is *article*."

Siegal and Connolly grimly insist on putting an apostrophe in decades: We're coming to the end of the *90's*. They have a reason: Many publications omit such apostrophes, but they are needed to make *The Times'* all-cap headlines intelligible and are therefore used throughout the paper for consistency. That means that you, dear reader, are free to drop that apostrophe if you don't use all caps in your headlines.

STYLE is not a set of rules; it is a group of conventions to reflect an attitude and set a tone. "In approaching the mechanics of usage and grammar," write Siegal and Connolly, "this manual reflects *The Times's* impression of its educated and sophisticated readership – traditional but not tradition-bound. ...Throughout, the goal is a fluid style, easygoing but not slangy and only occasionally colloquial."

The best thing about this institution's language arbiters is their sense of place – neither on the ramparts nor on the cutting edge. For that reason, I would cheerfully plunk down $30 for the *New York times manual of style and usage*, though I would capitalise a few of those words and put an apostrophe after the *Times*. ■

Wit and wisdom

A. G. NOORANI

Name-Dropping: From F.D.R. On by John Kenneth Galbraith; Houghton Mifflin Co.; pages 194.

WERE it not for his solid reputation as a teacher and writer, John Kenneth Galbraith's ready and irreverent wit would have led people to dismiss him as a delightful gadfly. Even those familiar with his record of wise counsel during many a crisis might be forgiven for regarding this slim volume as a self-indulgent memoir by a 91-year-old celebrity. They would soon find themselves proved wrong as they turn its pages. There is a fund of good sense, even wisdom, spread over the book. It is more than serious; it is sad. An aspect to his personality that emerges, despite the well-deserved reputation for arrogance, is a deep, abiding commitment to friends and to friendships and an endearing sensitivity to warmth in others.

Galbraith set out to describe the political personality of the ones he writes about: Franklin Delano Roosevelt, his wife Eleanor, Albert Speer, the Nazi wizard, Harry Truman, Adlai Stevenson, John F. Kennedy, Jawaharlal Nehru, Lyndon B. Johnson, Chester Bowles and, more briefly, some others, especially from the British Labour Party. But he abandoned the idea and decided, instead, to write on how they "appeared to their contemporaries, of whom I was one". The author is conscious of the risks it entails. "Reminiscences and anecdotes, as they tell of one's meetings with the great or the prominent, are an established form of self-enhancement." Critics might dub the exercise name-dropping. Hence, the self-deprecatory title of the book.

There are flashes of insight and of wisdom and admissions and revelations that astonish the reader. Galbraith repeatedly praises Dwight D. Eisenhower as "one of the underestimated Presidents of our time. A Republican, he accepted the social legacy" of the New Deal era and confirmed it. "He also left the deathless and death-defying warning as to the military-industrial complex." The warning was delivered in his Farewell Address as President in 1959.

Ronald Reagan and Galbraith were founders of Americans for Democratic Action, a liberal voice in the U.S. "Ronnie, as he was known, left us when his screen career diminished and he began giving well-paid lectures on, as it was then denoted, the free enterprise system. His regression, we always said, was not from any commitment to newly acquired belief; it was only for the money."

Galbraith thought of writing a chapter on Churchill and de Gaulle but, having met them only after the War was over and for "no deeply operative purpose", he felt that to make anything of those encounters would, indeed, have been name-dropping.

The book wins the reader's attention as well as respect as it wends its way since its great hero is F.D.R. One cannot but recall Walter Lippman's attack on the candidate for the Presidency in January 1932 which neither friend nor foe allowed him to forget for the rest of his life. Charming but slippery, Roosevelt was "a highly impressionable person without a firm grasp of public affairs and without very strong convictions.... He is an amiable man with many philanthropic impulses, but he is not the dangerous enemy of anything... a pleasant man who, without any important qualifications for the office, would very much like to be President" (Ronald Steel: *Walter Lippmann and the American Century*, Vintage, 1981; pages 291-292.)

There is a fund of good sense, even wisdom, spread over the book. It is more than serious; it is sad... It wins the reader's attention as well as respect as it wends its way since its great hero is F.D.R.

There is a word in Urdu which is difficult to translate into English. *Mardum-shanaasi* is a talent for sizing up persons, for assessing character. A whole decade and more earlier, the sage Oliver Wendell Holmes passed a judgment which endured after the phases of both demonising and hero-worship of F.D.R. were over – "a second-rate intellect, but a first-rate temperament." F.D.R's skills as a political leader of acumen are described well in this book. So also the mindset of Big Business which bitterly opposed him. It was the sense of lost prestige that mobilised privilege. The state would assume a role in shaping the economy that once belonged to the rich exclusively. "This antagonism became a considerable source of strength for him as well." Before long, some of the leading lights of the business community were co-opted to work for the President.

It fell to Galbraith, as a director of the U.S. Strategic Bombing Survey, to interrogate Albert Speer who began as Hitler's architect and became the czar of arms production in 1942. The experience left a deep impact on Galbraith's mind, of which he became very conscious during the Vietnam years. "There is grave doubt that the strategic long-range bombing of Germany effectively shortened World War II. That war won by the troops on the ground." His co-director, George Ball, thought the same way. What effect could bombing have on "the vast rural reaches of North Vietnam... they were, above all, agricultural, not military, targets?"

Speer was adroit under questioning, combining professions of innocence with disarming confessions. When he died, after serving his 20-year prison sentence, "he was, on balance, a well-regarded figure". Unlike him, other Nazi leaders were drug-addicts or alcoholics or both. The head warden of the prison remarked: "Who would have thought we were fighting the greatest war in history against that bunch of jerks?" Hitler proved his ineptness by attacking the Soviet Union and declaring war against the U.S., in unique fulfilment of a treaty obligation (to Japan).

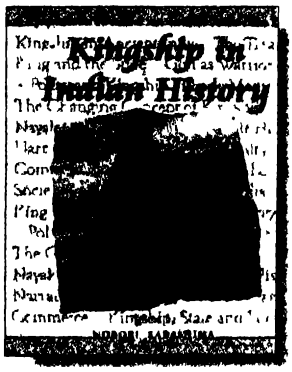
Galbraith, surprisingly, is "not wholly in sympathy with much of this discussion" on Truman's decision to drop the atomic bombs on Japan. He "did not have a choice", the author avers dismissively and wrongly. An ardent Democrat and a party activist, Galbraith worked actively for Adlai Stevenson, John F. Kennedy and Eugene McCarthy. He left the Stevenson team to work for Kennedy and Robert Kennedy's for McCarthy. Objectivity eludes him more than once. J.F.K. had played a dirty and well-recorded trick on Stevenson in the aftermath of the Cuban

missile crisis. Galbraith slurs over it. The disaster that was Nehru's meeting with Kennedy and other admirers among his aides is authentically recorded in the memoirs of Arthur M. Schlesinger, Jr. (*A housand Days*) and of Theodore C. Sorensen (*Kennedy*). Both were published in 1965. Kennedy became convinced "that India's potential role in world affairs had been overestimated by its admirers". One gets a misleadingly watered-down version in Galbraith's account (p. 140). This is attributable to his deep regard and affection for Nehru. One is amazed to learn that Nehru was flattened by and owned up Malcolm Muggeridge's famous comment on Nehru: "You realise, Galbraith, that I am the last Englishman to rule in India." Neither of the two realised, of course, that his was unjust to Nehru.

Nor is Galbraith realistic about India's influence on the course of global politics. He, however, rightly criticises Pokhran-II as a "mindless, useless and even disastrous recourse to the testing of nuclear weapons. India became a minor player in the nuclear arms race" (p. 134). This comes from a committed friend of India.

He has a dig at our politicians' "enduring appetite for oratory" and proceeds acidly to remark: "In Western democracies, those listening to a lengthy speech think of the more interesting things they might be doing; they are hoping for the end. In India, public address is a welcome alternative to idleness, even greater boredom. (The often appalling Indian motion pictures serve the same function.) Accordingly, the longer the speech, the more it is appreciated. This, Nehru fully understood. Galbraith clearly did not understand Nehru's own weakness for verbosity. His remarks on Mountbatten are justifiably scathing: "Nothing in the twentieth century was so badly handled and with such disastrous consequences as Mountbatten's policies on India's independence..."

These vignettes, written with urbane wit and felicity of style, make for absorbing reading. It is as a dissenter that Galbraith will ever be known in all discussions on U.S. foreign policy. His views on policies towards the Third World and the USSR have been vindicated by time. The trait in the U.S. State Department he particularly singles out for criticism is widely shared by others as well, our Ministry for External Affairs included. It is "institutional rigidity, which holds it firmly on course even when it is visibly wrong... this rigidity, with its strong commitment to error, has prevailed in both past and present times..." ■



■ BOOKS

A perspective on Indian kingship

PARVATHI MENON

in Indian History: Japanese Studies in South Asia No.2, Noburu Karashima (ed.); Manohar, New Delhi, 1999; pages 271, Rs.500.

THE Japanese Association for South Asian Studies, established in 1988, gave formal expression to the growing body of India-related research and writing in the universities and research institutes in Japan. Drawn from across the social science spectrum, Japanese scholarship on India shares a rigorous empirical approach. Indeed, the historical component of this tradition, its strongest perhaps, could almost claim the status of a 'school' of India studies. The work of Japanese historians who write on India is distinguished by a mastery of the language and structure of the main source material of the period under study, and by the innovative use of quantitative techniques in analysing historical data. The Association for South Asian Studies has a robust publishing record. It is into the tenth annual issue of its journal, and it also brings out an annual newsletter. The book under review is the second in a series on South Asia (the first, a collection of essays on caste in India, was published in 1997).

Noboru Karashima, editor of the volume, is the doyen of historical studies on India in Japan. In India, south India in particular, his is a well-known and admired name in historical circles, as his work and academic collaborations have substantially advanced the frontiers of knowledge on the economy and politics of medieval south India. The volume brings together a selection of nine studies by Japanese historians on kingship in the ideology and practice of the medieval period. Three of these articles look at the theory of kingship in literary sources, while the others are studies of the actual forms that kingship took in different regions of India, the evolution of these forms, and the historical purposes they served.

The question of kingship, linked as it is to the important issue of state formation and forms of state control, has generated much debate in historical and anthropological studies in India. The variety and complexity in the forms of early and medieval kingship across the country (between the 'great' traditions of monarchy and statecraft, and the 'little' traditions that proliferated outside them) is evident from the variation and unevenness of source material. Karashima, in his introduction to the volume, notes the tendency in this large and growing body of research towards the "blurring or losing of the historical perspective... with changes in the meaning and function of kingship being ignored." He evaluates the contributions in the volume in the light of standard approaches to the concept and function of kingship in academic research, as for example, 'secular' vs 'religious' and 'political' vs 'ritual'. But these issues can be concretised only by actually looking at the historical data to see how kingship of its agencies permeated local communities. Most of the essays in the volume do not offer theoretical postulations that are not drawn from a meticulously marshalled source base.

THE first article by Genichi Yamazaki is a comparison of the theory of kingship as presented in three major literary sources of ancient India, on the one hand, and how it found practical expression as revealed in four major inscriptions of around the same period. The literary sources are the Dharmasastras (c. 200 B.C. and A.D. 200) reflecting orthodox Brahmanism; the Buddhist literature written by heterodox thinkers between c.500-100 B.C.; and the *Arthasastra*, a book on

political science believed to have been written around the third century B.C. The theories on kingship postulated in these works are compared to kingship as described in the Edicts of Asoka (third centry B.C.), the Hathigumpha Inscription of Kharavela (second to first century B.C.), the Junagadh Rock inscription of Rudradaman (second century A.D.), and the Allahabad Pillar Inscription of Samudragupta (fourth century A.D.). Yamazaki lists 18 attributes of kingship in the three literary sources – 12 of which they share, and six on which there is a divergence of views. If the orthodox and heterodox schools hold two extreme positions of the scale, the four actual systems of kingship as described in the inscriptions are strung on the scale between these extreme positions. Purely on the basis of the features of kingship that the inscriptions share with the literary sources, what emerges from the study is the shift along the scale from heterodox to orthodox forms of kingship between the age of the Mauryas and the age of the Guptas.

The question of kingship, linked as it is to the important issue of state formation and forms of state control, has generated much debate in historical and anthropological studies in India.

Takanobu Takahashi and Hiroshi Yamashita look at the images of kingship in the *Tirukkural*, the didactic Tamil classic of the fifth century, and in two major Sangam works of around the same period, namely the *Tirumurugatrupadai* and *Paripadal*. Takahashi looks at why the *Tirukkural* is not as aggressively prescriptive as say, the *Arthasastra*, in its treatment of the duties and rights of the king, and why it only offers rather vague and often naive generalisations on kingship. Yamashita evaluates the view held in Tamil literary studies that the Hindu concepts of god in Tamil India owe a great deal to indigenous notions on the warrior-like and superhuman king. According to this theory, the ancient Tamil king was a warrior *par excellence* and the gods of the period were consequently invested with similar virtues. Yamashita's own reading of the texts does not support this view. Both he and Takahashi urge a re-examination of the Sangam works.

Complementing these contributions is an excellent study by Yasushi Ogura about temple architecture being the mirror of changing forms of kingship during the Chola period. If royal involvement in temple building was a way of expressing and consolidating ideological and political legitimacy by the Chola kings, then these forms changed through the 400 years of the Chola period. Looking at conventions of temple building over this period, at royal involvement in construction, and at changing forms of iconographic representation, Ogura concludes that the Chola pattern of seeking legitimacy "... developed from a simple and more heroic form in the early period to a more sophisticated Sanskritised form in the later period, while in the middle transitional period, both forms were mixed together."

Karashima's contribution to this volume is a study of the Vijaynagar nayakas, a stratum of intermediaries between the ruler and the local communities, who were conferred military titles and held superior rights in the land. Compiling the lists of nayakas appearing in Vijaynagar inscriptions in the districts of Chinglepet, North Arcot, South Arcot, Tiruchirapalli and Thanjavur, he has looked at nayaka rule in relation to their control over land and taxation systems, and the nature of their subordination to the Vijaynagar kings. Karashima's conclusions strengthen the idea of a hierarchical and inclusive power structure that extended from the king at the apex to the local communities at the base, an understanding that contrasts with that held by another distinguished historian of south India, Burton Stein.

Nobuhiro Ota's survey of two clans of the Beda Nayakas in Karnataka is an interesting study of the historical narratives of two families. He looks at how the clans secure a desired self-image through the use of idioms and legends, in order to establish themselves within the larger caste/clan on the one hand, and within the military/political structure of the nayaka system on the other.

Studies on the practice of kingship and society in early medieval Rajasthan by Masahiko Mita, in 18th century Khurda (Orissa) by Akio Tanabe; and in 17th to 19th century Deccan by Hiroyuki Kotani complete the volume.

It must be said that the high academic standard of the contributions is unfortunately not matched by the quality of editing. Editing errors are aplenty and do detract from an otherwise absorbing read. ■

■ BOOKS

SUSAN RAM

by J.M. Coetzee; Secker & Warburg, 1999; pages 220, £14.99, special Indian price Rs.590.50.

IT is, perhaps, coincidental that the final Booker Prize of our century should go to a South African writer. But as you read *Disgrace*, J.M.Coetzee's eighth novel and his second to win the prestigious literary award, you become aware of a certain bleak appropriateness. It is not so much that South Africa, with its rare physical beauty, mineral bounty and human diversity, is poised to enter the new millennium weighed down by its grim, oppressive past. In political terms, there has been, if not a revolution, then a partial overturning of the old order. Apartheid, the dominant reality of South Africa's twentieth century, has been dismantled. The formal structures of a modern democracy have been put in place. Innovative efforts have been made, through the Truth and Reconciliation Commission, to come to terms with the past. But all this seems overwhelmed by a continuing sense of tragedy. As the stories come out of South Africa – stories of unemployment at epidemic levels, rising crime, lives blighted by Acquired Immune Deficiency Syndrome (AIDS), defeated expectations – the realisation grows that the process of reckoning has only just begun.

Coetzee's new novel is essentially an engagement with the anguish and the mayhem that stalk contemporary South Africa. But where another writer might have been tempted to assay the grand scale, mounting a broad sweep through a society in crisis and producing a blockbuster, Coetzee adheres to a modest canvas. Herein lies his effectiveness. Through his small, spare story, with its unheroic central character and its encounter with violence that, by prevailing South African standards, can be deemed a brush, he unlocks a stash of themes and issues.

With a rape at the centre of the narrative, there is an exploration of the act of rape along its personal, political and other dimensions. Growing old, understood not simply as a process of physical diminution and decay but as a loss of identity and being, is a running theme. There is attention to language, especially relevant in a culture of man most of them traditionally l

A comprehension of life

tempt by white South Africa, and to the ssociated challenge of communication in new times. Above all, Coetzee engages with difficult areas of human experience: confession of wrongdoing, atonement, forgiveness, the path back from purgatory to something like a state of grace.

COETZEE, a professor of literature at the University of Cape Town, draws the central figure of his novel from the academic world of the southern Cape. David Lurie, a white South African of English descent, is a university teacher for whom the certainties of life – a cloistered existence among the Romantic poets, a succession of women won over by his wit and boyish good looks – are in visible retreat. Leisurely literary pursuits stand uprooted in the new South Africa; David now teaches courses in communications skills, in the company of colleagues who are similar relics of the past, 'clerks in a post-religious age'. More damaging still to his sense of being is the awareness that his attractiveness to women is dwindling. As a womaniser once confident that 'if he looked at a woman in a certain way, with a certain intent, she would return his look', he experiences growing old (he is now 52) as losing 'the backbone of his life'.

Through his small, spare story, with its unheroic central character and its encounter with violence... Coetzee unlocks a stash of themes and issues.

David's response is a classic instance of mid-life male recklessness: he seduces one of his students. The one-sided affair quickly sours, exposure follows, and he finds himself before a university enquiry facing charges of sexual harassment. In the new South Africa, sensitivity to such issues is part of a larger human rights agenda, but David, locked in the past and incapable of frank self-exploration, reacts with disdain: while ready to plead guilty as charged, he will not issue the public statement of confession and remorse ('abasement' is how he sees it) that will save his job. Banished from the university, he now steps out into realities – geographic, social, racial, political – for which nothing in his years of sheltered, privileged self-preoccupation has prepared him.

With two broken marriages behind him, David has no partner to help him through the crisis. He therefore turns to his daughter Lucy, a woman in her mid-twenties who owns a homestead in the eastern Cape. This is several removes from the rural idyll of the Romantic poets, a dusty, incomplete Eden hobbled by 'poor soil, poor land... good only for goats'. But it is a sanctuary of sorts, a place where David might come to terms with his new situation, soothed by unhurried routines and his daughter's calm engagement with existence.

But in a society as ravaged and scarred as contemporary South Africa, sanctuary can only be fragile and temporary. The homestead becomes the target of a vicious assault in which Lucy is raped and David is bludgeoned, locked in a lavatory and set alight in a manner designed to taunt rather than kill or maim. His impotence as a father and protective male is underlined by this humiliation; the womaniser with the rarefied poetic interests must now confront his daughter's incomprehensible reaction to events: Lucy will not press charges of rape, will not even give voice to the fact of her violation.

Initially the reader shares the father's incredulity. But as the dialogue between father and daughter unfolds between confrontations and silences, Lucy's perspective reveals its inner logic. As a young white liberal who has made a conscious choice to stay on in South Africa, abjuring the easier option of moving to Europe to live with her Dutch mother, Lucy knows that there are implications, costs, sacrifices. Were she to pursue her rapists, who are black, she would set in motion all the old mechanisms of the past, unleash ancient prejudices, reopen wounds in the early, tentative stages of healing, set back the whole attempt of a society to knit itself together. Her contribution now, 'in this place, at this time', lies in stretching herself across the past like a protective wall or dam. The rape she will diminish in her mind to 'debt collection', a 'purely private matter' between herself and her attackers. And she will stay on in her farm, not in a spirit of bravado or confrontation but as an expression of something more elemental: that, somehow, this is what is needed, this might possibly endure.

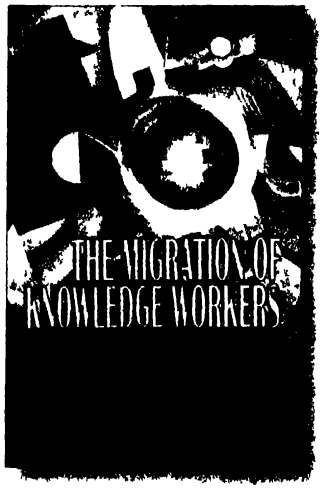
Such a course does not easily commend itself to David, for whom the whole notion of sacrifice is suspect. But the rape, and his daughter's reaction to it, prove unstoppably destabilising, forcing him to re-examine his life, his priorities, his sense of himself, his view of what the future holds. The results fall far short of a tidy resolution. Indeed, if Coetzee has a message to convey, it is about the incompleteness of life, its inherent messiness, the necessity of making do. At the end of the novel David has achieved at least this understanding.

This is a big novel, presented tautly and with understatement in a little over 200 pages. It is not without unevenness: like his protagonist, Coetzee is more at ease in the world of libraries and lecture theatres than in the rural Cape, and the opening section of the novel charting David's fall from grace is particularly persuasive. Not every strand introduced into the story works, however. A recurring motif is the unrealised music in David's head, and his attempt, through an episode in Byron's life, to give voice to it. There are interesting possibilities in the clash between inner music and external mundanity, between past poetic yearnings and the challenge of the present, but Coetzee perhaps leaves himself too little space in which to explore them convincingly. But such caveats in no way detract from Coetzee's achievement. *Disgrace* is an outstanding work of fiction, opening windows not only on a distant land but on painful, problematic areas of human experience that all of us find easy to pass by. ■

Brain drain vs brain gain

C.T. KURIEN

The Migration of Knowledge Workers: Second-Generation Effects of India's Brain Drain by Binod Khadria; Sage Publications, New Delhi, 1999; pages 240, Rs.350.



THE movement of professionally trained people – knowledge workers as they have come to be known – from one country to another is not a new phenomenon. During the colonial period the flow was primarily from the metropolis to the colonies. In the new international order that has been emerging since the end of the Second World War – when many colonies became independent but described as "developing countries" – there has been a reversal of the flow. Now, knowledge workers migrate from the developing countries to the developed ones, from the poor countries to the rich ones, to be more honest. It is this flow that has widely come to be known as "brain drain".

The phenomenon is now quite familiar, but a few statistics may still be useful. A 1994 study estimated that out of the annual output of highly qualified young men and women in India, 7.3 per cent in engineering, 2.8 per cent in medicine and 2.1 per cent in the natural sciences move to other countries in search of better earnings and conditions of work than would be available in India. Another study found that roughly one-fourth of the B.Tech graduates who pass out of the Indian Institutes of Technology (IITs) are moving out of the country. It is well known too that in the area of computer science, those leaving the country as a proportion of those trained is even higher.

With globalisation, and the relatively freer mobility that is now becoming possible to highly skilled persons in practically all walks of life, brain drain could become even more pronounced. There is a natural explanation for this. Governments of developing countries attach a great deal of importance to higher education, especially in the sciences and in technology. Developed countries find in such trained people a ready-made recruitment pool. The poor spend on training, the rich make use of that training – at relatively low cost!

That is the "first generation" aspect of brain drain. But is it possible to visualise a "second generation" effect of this phenomenon? Can the emigrants participate in certain selected but specific nation-building activities as opposed to the general stereotypes, asks the author. Isn't it possible that in this age of globalisation there may be a significant return flow of resources that can replace and replenish what is being drained away? These are the questions that the author of the book sets out to explore. In short, can brain drain in the newly emerging global situation become "brain gain"? Is this already beginning to happen?

For his enquiry the author has chosen the brain movement between India and the United States. While the U.S. may be correctly described as a land where the vast majority of the population consists of immigrants and their descendants, free immigration was for long restricted to those from Europe. Even as late as the middle of the present century there were severe restrictions on immigration from Asia. Similarly, Indians traditionally emigrated to the United Kingdom and Canada (among the Western countries). Only in the early 1970s did the number of persons emigrating to the U.S. begin to exceed the total of those going to the U.K. and Canada. However, by the early 1990s, the number of people migrating to the U.S. from India was almost twice as many as those going to the other two countries. Today, the Indian community in the U.S. (migrants plus Indians born in that country) forms a noticeable proportion of the Asian population there. What is more important is that among the immigrant communities, Indians constitute a much higher proportion of the labour force (that is, those employed and those actively looking for employment). The data given in the book on this aspect is rather dated, but still important. According to the 1980 U.S. Census figures, 75 per cent of Indian immigrants aged 16 and over were in the labour force – 95 per cent of them were employed, while 5 per cent were looking for jobs. This figure was significantly higher than that for all immigrants (56 per cent in the labour force) and noticeably higher than the figure for total U.S. population (62 per cent in the labour force). More striking perhaps was the fact that in 1983, the share of professionally and technically qualified immigrants constituted 50 per cent of the total Indian immigrants, placing Indian knowledge workers at the top of the list of those from all Asian countries, including Japan. Average earnings of Indians are also considerably higher than those of other Asian immigrant communities. One of the major weaknesses of the book is that while it is full of facts and figures, information on some of these significant aspects is very dated.

Knowledge workers migrate from the developing countries to the developed ones, from the poor countries to the rich ones. This flow has widely come to be known as "brain drain".

In terms of the questions that the author had set out to explore, the three final chapters of the book are the most important. The first of these, Chapter 5, contains a well-documented and revealing account of the benefits that India may have accrued by way of remittances from Indian communities in different parts of the world, technology transfers and services rendered directly by expatriate Indians. Remittances have been quite significant, especially in relation to the balance of payments problem. But

the final verdict the author arrives at are: (1) "...in terms of return of money... to India, globalisation of the Indian knowledge workers has not been quite gainful to the country" (p.150) when remittances are considered as returns on capital invested for training; (2) "...the payments made by developing countries to developed countries on technology account would be in the vicinity of U.S. $10 billion per annum, cancelling at one stroke a major part of the total aid flow from the latter to the former" (p.156); and (3) "...gains realised from the geo-economic presence of Indian knowledge workers in the U.S. neither necessarily nor sufficiently support the proposition of a successful globalisation of India's human capital through emigration of Indian professional and qualified manpower, whether to the U.S. or to any other developed country" (p.162).

So much for the first generation aspects of brain drain. Evidence points to the fact that it is still a drain. What about the second generation possibility? The last two chapters deal with this question. Chapter 6 reports on interviews the author conducted with a few returnees in India, some non-resident Indians in the U.S., and a few select experts and academicians in both the countries. The exploration was aimed at studying whether Indian knowledge workers outside the country can help India, specifically in the areas of education and health care. There are, of course, examples, some of which qualify as "shining examples". Indian scholars who settled abroad have come back, often during their sabbaticals, to teach in India or to interact with researchers here. Doctors too have made their services available to their parent country. More important, institutions have been founded and continue to be supported by Indians living abroad, including some of the prestigious hospitals in the country. In all, the author sees evidence of "some silver streaks ... even if no proper silver lining" (p.164). But, there are severe constraints. For one, only well-established senior professionals who have spent some 15 years in the countries to which they migrated can afford to turn to social service. More important, globalisation severely discounts social service, and puts a high premium on value for money. Born optimists may find signs of some hope somewhere in situations like this. But realistically speaking, the possibility of the "brain drain" turning into "brain gain" for countries such as India is a matter for the future – a very distant future, indeed. ■

■ BOOKS

An exceptional career in politics

ROBERT DALLEK

Edward M. Kennedy: A Biography by Adam Clymer; William Morrow & Co; pages 692, $27.50.

IN 1968, after Robert Kennedy's assassination had deprived the nation of his likely election to the presidency, Democratic Party leaders urged his 36-year-old brother, Senator Ted Kennedy, to run in his place. They assured him that the nomination was his for the asking. Kennedy refused: "How could I conscientiously combat allegations by Nixon...that I was too young, that I had no record in public life strong enough to recommend me for the high office of President, that perhaps I was trying to trade on my brothers' names." Kennedy's self-denying response in 1968, among many considerations in deciding not to run, stand in stark contrast to current assumptions about running for President. A want of political experience as an officeholder, elected or appointed, is no deterrent to becoming a candidate. Celebrity is an acceptable credential for a White House bid.

As Adam Clymer, Washington correspondent for *The New York Times*, demonstrates in this first-rate biography, Kennedy has consistently put public ideals above personal ambition during his 37 years as a U.S. senator. Clymer's book is not a hagiography; Kennedy's personal flaws are on full display. But unlike so many other recent political biographies, Clymer's volume focuses not on sex or scandal but on politics.

Americans interested in substantive public questions have been rewarded with a biography that reconstructs Kennedy's role in the many major domestic and foreign policy issues that have been central to his political career. This is not to imply that we are in the presence of some dry political chronicle devoid of the personal tragedies that have punctuated Ted Kennedy's life. The suffering he endured through the murders of his brothers and the illness of a son who lost a leg to cancer are sensitively covered. The author also deals forthrightly with the senator's failed marriage and the Chappaquiddick scandal.

What sets Clymer's discussion of the personal apart from recent biographical exposes is the link he makes between the private and the public. Some biographers of John F. Kennedy, for example, have explained their emphasis on his womanising by asserting that it jeopardised his presidency; his impeachment was only a newspaper story away, they argue. But as Clymer convincingly demonstrates, journalists in the 1960s published little or nothing about politicians' sex lives. When Senator Kennedy became drunk on a plane ride home from Alaska, the reporters with him did not publish stories about it.

Clymer says that he believes that Chappaquiddick – with the death of Mary Jo Kopechne on Martha's Vineyard in 1969 in a car accident caused by Senator Kennedy's carelessness – changed the way in which journalists write about politicians' private lives. The accident raised questions about the senator's character and put him under a journalistic spotlight. Whether it was only or even principally Chappaquiddick that altered journalistic standards is debatable. But Chappaquiddick was of crucial importance in Ted Kennedy's political career. It was a decisive element in the defeat of his presidential ambitions in 1979-80. Consequently it receives Clymer's close scrutiny, not for the sake of salacious details that might titillate readers but rather because it was of such importance in Senator Kennedy's public life and the life of the nation. Clymer argues that despite never gaining the presidency, Senator Kennedy has been a major political force as an heir to the idealism John and Robert called forth and as the unflinching leader of New Deal liberalism. He writes that Senator Kennedy "deserves recognition not just as the leading senator of his time, but as one of the greats in its history".

Clymer's book is also a fine counter to the cynicism and indifference that have recently reduced voter participation in elections and discouraged too many of the country's best and brightest from taking up the challenge of a political life. ■

Indefensible arms

Excerpts from the South Asia on a Short Fuse: Nuclear Politics and the Future of Global Disarmament *by Praful Bidwai and Achin Vanaik, Oxford University Press, Rs.595.*

NUCLEAR weapons are quite unlike any other armaments. Their uniqueness lies in their truly awesome power of destruction on a scale unimaginable until rather recently in human history. Nuclear weapons alone have the potential to cause *total destruction*, exterminate humanity, destroy all life on earth. No other class of armaments can possibly cause that kind of havoc through an unstoppable chain of destructive events – including the release of vast amounts of energy through heat blasts, X-rays, and a range of radioactive poisons, some of which will remain lethal for millions of years. There is not, and cannot be, any defence against nuclear weapons, whether military, civilian, or medical. The totality of destruction wreaked by, and the unending lethality of, nuclear weapons gives them a singularly horrible quality, which is incomparable with any other instrument of war. They are unique even within the category of 'weapons of mass destruction'.

Ten years after the Cold War ended, the world still has enough firepower in its 30,000-plus nuclear weapons arsenal to cause a million Hiroshimas; indeed, wipe out the human race altogether. At least half of these weapons are in a state of alert or are deployed so as to be ready to be launched in a matter of minutes or hours. It is this sheer awesomeness, this vast, virtually infinite, limitless, destructive power of nuclear weapons that has radically altered the condition of human existence, indeed its very possibility, as never before.

At no time in the past has the world experienced such an obsession with a particular type of weaponry, nor has another class of armaments so fundamentally transformed, distorted, and in other ways affected, the way millions of human beings look at security and defence, experience mortal fear and vulnerability, or feel anxiety and uncertainty of the most profound kind. Nuclear weapons have the potential to terminate human culture, end history, murder the human imagination as we know it. Nuclearism is based upon a series of illusions. One illusion holds that security can be derived from insecurity, itself rooted in the capacity of adversaries to inflict limitless violence upon each other. Another is that responsible leadership structures exist at the military and political level which can prudently and effectively 'manage' nuclear weapons, and that the citizen can be reliably protected against the enemy's nuclear weapons. One of the greater illusions is that nuclear deterrence can, and will always, work dependably, enhancing mutual confidence and security.

Just and unjust wars

The acute problem posed by nuclear weapons is this: are they legitimate weapons of war? And are they compatible with the notion of just wars? This notion has two components going back to St. Augustine and the ethics of the use of violence: *jus ad bellum* (justice through war, or the justness of war itself) and *jus in bello* (justice in war, or in the conduct of war). For our purposes, it should be evident that the second is more important than the first. The first aspect is relatively simple to deal with only because nuclear weapons are quintessentially offensive weapons calculated to wreak devastation on an indiscriminate scale. They can have no function in a war waged in self-defence, or to vacate an aggression.

The use of nuclear weapons is simply inconceivable in, say, a war of national liberation, or one waged to defend values of decency, or of democracy and worthy political systems or cultures. Wars are just only insofar as they are waged in self-defence or in pursuit of causes that are noble, and oppose injustice and tyranny. Wars involve the deliberate use of lethal violence, which can be justified only because we recognise '*two* orders of fact, each of them compelling, each of them terrible'.

Wars are indeed 'destructive to the peace of the world' but they may nevertheless be necessary and just under certain circumstances. John Locke argued by analogy against the categorical pacifist view: 'They may as well say, upon the same ground, that honest men may not oppose robbers or pirates, because this may occasion disorder or bloodshed... If any mischief come in such cases, it is not to be charged upon him who defends his own right'.

It is virtually impossible to countenance the possibility that a nuclear war could meet any elementary criterion underlying the notion of *jus ad bellum*. How can epochal, apocalyptic forms of mass destruction and insensate violence possibly promote a cause that is noble? The nature of any struggle against tyranny and injustice, however grave, is undermined by the greater tyranny of nuclear destruction. Indeed, even the creation of the wherewithal to wage nuclear war, a gigantic military apparatus ready and willing, and in a state of alert, to wreak devastation upon the earth, itself involves disregard for values such as sobriety, caution, democracy, and transparency, and an obsession with paranoid and jingoistic notions of national security.

At best, a rather wishful case could be made out in favour of the *threat* of use of nuclear weapons: the idea that through active preparation and readiness to use such weapons, one might be effectively and reliably able to deter an adversary from using his own nuclear armaments or other weapons of mass destruction (WMDs). This, however, really pertains to the issue of nuclear deterrence, its morality and its strategic value, not to the morality of the actual use of such weapons. Nuclear deterrence is discussed separately below.

There are several criteria of *jus in bello*, which have evolved over the past centuries through debates on ethics. Some of these have been incorporated into jurisprudence and bodies of international law and international humanitarian law. War and methods of warfare cannot be divorced from rational strategic considerations. The use of force must be *proportionate* to the threat that it is meant to contain. Excessive force or violence is not permissible. Non-combatants must not be targeted. The use of cruel or inhuman methods with pitiless disregard for basic human values is forbidden. For instance, you cannot mass-poison civilians or starve prisoners of war. Prisoners of war have rights, just as combatants, even guerillas,

have rights. Wars must be fought well and scrupulously. Certain methods of warfare are totally prohibited no matter how admirable and desirable the end they might achieve. There are rules about hostages and blockades, and about reprisals and retribution.

Indiscriminate destruction

Nuclear weapons fail each of these criteria. They kill massively, indiscriminately, without distinguishing between combatant soldiers and non-combatant civilians. Indeed, they are quintessentially indiscriminate and acquire their particularly horrifying character precisely because they kill massively and indiscriminately... If the world could outlaw chemical and biological weapons, and even agree to an anti-personnel landmines ban, then surely the case for eliminating nuclear weapons – which are incalculably more destructive and more indiscriminate in the damage they cause – is even stronger.

The case extends even to nuclear deterrence, the doctrine that holds that an adversary can and should be effectively deterred from attack by virtue of being threatened with the infliction of 'unacceptable' damage. Nuclear deterrence not only legitimises horror weapons but entails a willingness to use them, whether in anticipation, to pre-empt an enemy attack, or in retaliation or reprisal. Without such willingness, indeed a firm commitment, to use them, deterrence loses its sting, becomes meaningless. Every established nuclear weapons power has well-formulated, elaborate plans to *use* nuclear weapons. Whatever the difference in the details of their strategic doctrines – whether they profess a policy of No First Use, and of No Use against a non-nuclear adversary, or are wedded to 'extended deterrence' and pre-emptive use of nuclear weapons even against non-nuclear states – each of the P-5 has well-developed plans for the *actual* use of such weapons. These go well beyond mere *intentions*, themselves highly objectionable. They involve *actual* preparations, the creation of extremely expensive command, control, communications, and intelligence infrastructures (which in the U.S. alone have cost over $4,000 billion), and *credible* war-fighting schemes to which nuclear weapons are central.

The Gandhi-Nehru legacy and its degradation

Ever since Mahatma Gandhi declared that nuclear weapons 'represent the most sinful and diabolical use of science', India's leaders have forcefully characterised (until recently, that is) nuclear deterrence as an 'abhorrent' and 'morally repugnant' doctrine. Indeed, India's classical position, officially stated by its first Prime Minister, Jawaharlal Nehru, insisted that not only the use or threat of use of nuclear weapons, but even their manufacture and possession, be 'declared a crime against humanity'. India's diplomats, spokespersons and Ministers until 1998 energetically argued that nuclear deterrence is simply impermissible and morally unacceptable...

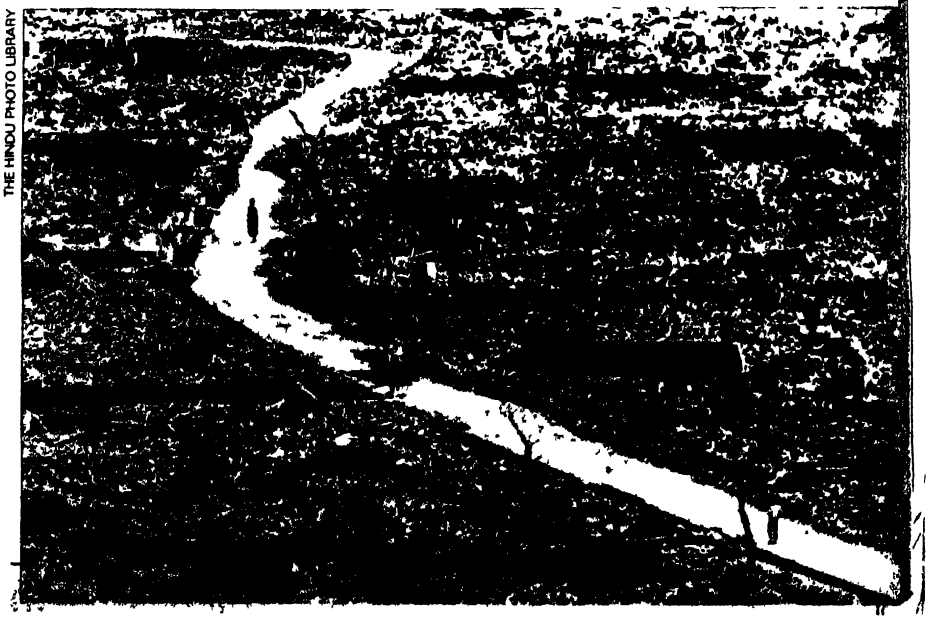
Thus, it was not an aberration that India in 1995 pleaded before the World Court that nuclear weapons are illegal and incompatible with international law and international humanitarian law, and advanced an elaborate set of arguments for outlawing their use, threat of use, manufacture or possession. The written statement of the Government of India before the International Court of Justice contends, on the basis of Article 2(4) of the U.N. Charter, that 'any use of nuclear weapons as a measure of use of force to promote national policy objectives would be unlawful' and the 'use of nuclear weapons in any armed conflicts as a first attack would be unlawful under international law'. Further, it argued that the use of nuclear weapons 'by way of reprisal or retaliation would violate the principle of proportionality and humanitarian law'; therefore, the 'prohibition of the use of a nuclear weapon in an armed conflict is an absolute one, compliance with which is not dependent on corresponding compliance by others'; it is a 'requisite in all circumstances'.

The Indian official statement reads:

This brings us to the question as to the legality of the use of nuclear weapons in an armed conflict on the ground that it is open as a measure of last resort under limited conditions as a matter of military necessity. A basic principle of the law of armed conflict and particularly the international humanitarian law, which is contained in Article 22 of the Hague Convention IV (1907), states that 'the right of belligerents to adopt means of injuring the enemy is not unlimited'.

Therefore,

the use of nuclear weapons in response to attack by a conventional weapon would patently violate the principle of proportionality, but also a nuclear response to nuclear attack, would violate the principle of discrimination, humanity, environmental security and probably the principle of neutrality as such an attack would not distinguish between combatants and non-combatants, causing civilian casualties, ravaging the natural environment and contaminating the territory of neighbouring and distant neutral countries. Nuclear deterrence had been considered to be abhorrent to human sentiment since it implies that a state if required to defend its own existence will act with pitiless disregard for the consequences to its own and adversary's people



This was not all. India also pleaded:

Since the production and manufacture of nuclear weapons can only be with the objective of their use, it must follow that if the use of such weapons itself is illegal under international law, then their production and manufacture cannot under any circumstances be considered as permitted.

Thus, the statement concluded:

In view of the above, it is submitted that the

threat or use of nuclear weapon in any circumstances, whether as a means or method of warfare or otherwise, is illegal or unlawful under international law

Similarly, it was the long-standing doctrinal continuity in India's radical and categorical rejection of nuclear weapons that led Foreign Secretary Salman Haidar to state at the Conference on Disarmament in Geneva in March 1996:

> India's objectives are different We do not believe that the acquisition of nuclear weapons is essential for national security, and we have followed a conscious decision in this regard We are also convinced that the existence of nuclear weapons diminishes international security. We therefore, seek their complete elimination. These are fundamental precepts that have been an integral basis of India's foreign and national security policy. It shall, therefore, remain our endeavour in the coming months to try to ensure that the disarmament agenda is not lost in a purely non-proliferation agenda.

New Delhi's embrace of this 'abhorrent' doctrine barely two years later, without as much as a figleaf of an attempt at a rational explanation of a change of stance, signifies not so much a change in ground realities or the regional situation, as the moral debasement of the Indian elite and a coarsening of the quality of public discourse in the country. The degeneration of the Indian elite is a long drawn out process, but it has become particularly stark and obvious over the past two decades. It is itself related to the evolution of domestic politics since the early 1980s: a combination of an ascendant Hindu communal ideology, growing alienation of the elite from the people, its militaristic obsession with India becoming a great power, and the spread of profoundly cynical political ideas.

A distinctive moral insensitivity

Perhaps the single most disturbing fact that emerged after the Indian tests (followed by the tests in Pakistan) was the moral insensitivity of India's policymakers in regard to nuclearism. In no country that had previously gone nuclear was the crossing of the threshold made into such an issue of national pride. The nuclear bombing of Hiroshima and Nagasaki is to this day supported by a majority of U.S. citizens. This is shameful, but the Bombs were viewed with a sense of relief, not pride. They were widely (though incorrectly) seen as helping to bring the Second World War to a rapid end. The Russian and Chinese tests were seen internally as necessary responses to the US and there was, of course, the officially organised drumming up of 'patriotic sentiment' typical of the authoritarian undemocratic regimes that existed at the time the first Bombs were developed and exploded in the two countries. In Britain, the public response was far more muted. Indeed, of all the NWSs, in Britain there emerged in the 1950s a major anti-nuclear mass movement and sentiment. In France, a significant 'patriotic' sentiment did emerge around nuclear weapons, but there was no euphoria.

In none of the first five NWSs was there anything to parallel or approximate the kind of nationalist euphoria and near-hysterical response that was characteristic of significant sections of upper-caste, upper-class Indian urbanites. The kind of celebratory scenes that were portrayed in the international media gave a misleading impression about the size and depth of popular support to the Indian tests. However, although small, the celebrations were real and disturbing in themselves. If similar behaviour was to be found in Pakistan after their government tested, this is more easily explicable as resulting from the popular belief that Pakistan could now match India. It is the insecurity, immaturity and moral insensitivity of the pro-nuclear Indian elite that is most striking. No one in Pakistan talked of building a mosque in commemoration of the 'grand act', but Hindu nationalist organisations like the VHP declared their determination to build just such a temple to worship Shakti, the goddess of power, in commemoration of the Pokhran-II blasts!

At one level, it is not difficult to understand (without ever condoning) this new elite sense of pride. After all, what else has the Indian elite helped accomplish over the last 20 years that could be a source of national pride? Poverty, illiteracy, institutionalised injustices of all kinds continue to haunt Indian society. To take pride in the possession of what even Indian hawks once used to admit was a 'necessary evil' testified to the existence of a profound moral sclerosis. However necessary one might consider an evil, the fact that it is an evil should preclude celebration or pride at its arrival. But it did not. Equally disturbing was the fact that not a single strategic expert, politician, or media-person among all those who supported the tests criticised the praise (official and non-official) that was showered upon Indian science and scientists following the tests. This was truly extraordinary.

Not one prominent supporter of the Bomb found the intelligence or integrity to say what could easily have been said: That even as he or she supported the tests and India's newly declared status as a nuclear weapons power, he or she lamented the fact that Indian science had to be *misused* and that the skills of 'our wonderful pool of scientists' had to be *abused* to produce these evil weapons (when we would have preferred to use their skills for so much more worthwhile ends) because India felt compelled for security reasons to follow the path of other NWSs which had similarly abused science and the skills of their own scientific community. To have said as much, even while supporting Indian nuclearisation, would have at least shown a recognition of the proper relationship between science and ethics. That no prominent pro-Bomb person stated this obvious truth was a striking testimony to the collective absence of a reasonable level of moral sobriety, balance and sensitivity.

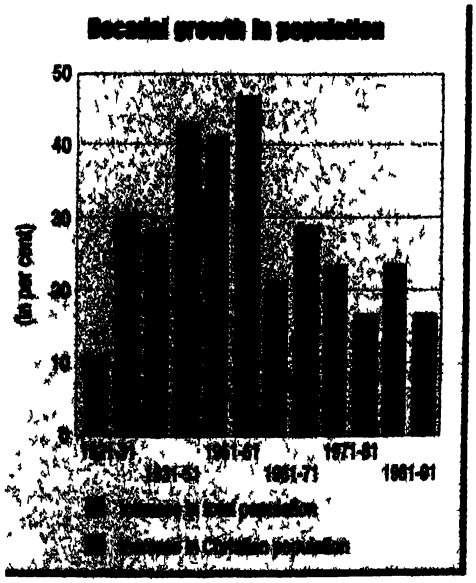
Influential sections of the Indian and Pakistani media selectively played up the 'popularity' of the Bomb. Based on no more than a few casual phone calls, one of them reported that 91 per cent of Indians support India's nuclear weapons. The DAE and DRDO scientists and engineers responsible for Pokhran-II were instantly turned into heroes and glamour figures. The circumstance that they disguised their identities, misled their families on their whereabouts, and wore military fatigues, was celebrated as a great achievement. Awards and prizes were showered upon them even as they openly advocated the creation of a 'military-industrial complex' and 'defence-based development.'

Opposing nuclear weapons is not merely a personal matter. There are certain universal evils that must be recognised as such. They debase all of humanity: those that seek to benefit from them as well as those who are their purported or actual victims. Such is the case with evils like apartheid, colonialism, and nuclearism, all of which involve insensate violence. They are often justified in the name of 'national security', 'the national interest', 'national greatness', etc. We cannot create a sustainable and durable nuclear-free world unless we value our common humanity and sustain a shared anger for such universal evils as nuclearism. It is only on the basis of this shared but controlled anger and passion whose wellsprings are our individual moral capacities that we can hope to build a wider consciousness across national boundaries. That alone can help bring about the goal of complete and global nuclear disarmament. ■

A numbers game

The campaign by the Sangh Parivar that there has been a disproportionately high growth in the Christian population in India relies on skilful and selective suppression of facts.

V SRIDHAR



THE repeated articulation by sections of the intelligentsia of mendacious theories floated by Sangh Parivar elements goes some way towards investing these with an aura of legitimacy The canards the Sangh Parivar spread about Muslims in India since the 1980s (*Frontline*, October 25, 1991) gained currency because its propositions were repeated even by informed sections of society This strategy is now being employed against Christians in India While attacks against Christians have gone on across the country, the Sangh Parivar has managed to focus on the evil designs' of Christian missionaries indulging in mass conversions' This shrill campaign, which grew ever louder on the eve of Pope John Paul II s visit, has however been picked up by others

On the day the Pope arrived in India several newspapers published (as an advertisement) an open letter to him addressed by several prominent personalities Among those who appended their signatures to the letter, under the banner of the Citizens Committee of Dharma Raksha Sammelan in Chennai, were the ophthalmologist Dr S S Badrinath, dancers Sonal Mansingh and Padma Subramaniam and several writers and film personalities

They alleged that evangelisation was but a "less dignified cousin" of 'conversion" and that "the Christian missionary activity in our nation is tearing apart families and communities in every strata of our society" They said that "religious conversion, which seems to be synonymous with papal work, is violence pure and simple." They blamed the "intolerance of missionaries" for the "clashes" that occurred regularly since the Bharatiya Janata Party came to power in 1998 "We Indians are deeply hurt by the spurt in the aggressive campaigning of the Church to convert the people of India by all available means," they claimed.

On the eve of the Pope's visit, *Organiser* the mouthpiece of the Rashtriya Swayamsevak Sangh (RSS), published several articles attacking the Christian community in India The Pope was obviously the main target, but there were also articles which used official and other statistics to back claims of a massive increase in the Christian population in India An article titled "Christian population Misleading figures,' by Rajendra Kumar Chaddha in the October 31 issue, used statistics" to drive home the point that the Christian population is increasing at an alarming rate

The author provides a list of districts in India where the Christian population has grown by more than 100 per cent between the 1981 and 1991 Censuses However, an analysis of the Census data reveals that the *Organiser* has abused the statistics in several cases, suppressed relevant facts in some others, and used bogus figures in still others For instance, *Organiser* claims that the Christian population as a percentage of the total population increased from 2 53 per cent in 1981 to 2 61 per cent in 1991, however, Census data show that the percentage declined from 2 45 per cent to 2 32 per cent during this period The ratio of Christians in the population increased by a little over half a percentage point between 1921 and 1991, indicating that conversions are an insignificant factor in the long term demographic transition of Christians in India (see Table 1)

The list of districts in which the RSS claims that the Christian population increased sharply between 1981 and 1991 is interesting (see Table 2) The article provides just the percentage of increase of the Christian population It ignores any mention of ratios of Christians in the total population, details which will indicate whether their weightage in the population is increasing What is striking is the small numbers of Christians in many of the districts listed in the *Organiser* article For instance, in Guna district in Madhya Pradesh, the number of Christians increased from 258 to 642 over a 10-year period ending in 1991 Although this is an increase of nearly 150 per cent, the fact remains that the Christian population in Guna accounted for 0 05 per cent of the total population in 1991, up from 0 03 per cent in 1981 Obvious factors such as migration into the district over a 10-year period have not been taken into account by the author, who seems determined to attribute the increase entirely to conversions

In three cases of the districts examined – Udaipur and Sirohi in Rajasthan, and Periyar (now Erode) in Tamil Nadu – *Organiser*'s figures are false For instance, *Organiser* claims that the Christian population increased by 928 per cent between 1981 and 1991 in Erode district, the fact is that the Christian population here increased by only 2 28 per cent during this period In fact, in 1991 Christians accounted for 1 86 per cent of the population of 2 32 million, having declined from 2 02 per cent in 1981

In the case of Arunachal Pradesh, *Organiser* again makes a skilful suppression of facts about percentages and ratios. Its claim that the Christian population in Arunachal Pradesh grew by

226 per cent between 1981 and 1991 is true; however, it fails to mention that the Christian population as a percentage of the total population increased from about 4 per cent in 1981 to about 10 per cent in 1991. The Census figures show that the population of the States in the north-eastern region increased at a rate far above the national average. For instance, while the population of India increased by about 24 per cent, the population of Arunachal Pradesh increased by 37 per cent between 1981 and 1991. This was probably because of the porous nature of the border in these States and also because of large-scale migration within the region. Interestingly, while *Organiser* mentions the districts where the Christian population grew more rapidly than the Hindu population between 1981 and 1991, it fails to mention two other districts in the State – Upper Subansiri and Lohit – where the Hindu population grew much faster than the Christian population (see Table 3).

Population by religion in India
(percentage of total population)

Census Year	Hindu	Muslim	Christian	RSS claims on Christian Population
1921	84.40	9 57	1.79	1 47
1931	84.34	9.86	2 11	1 77
1951	86 89	9.09	2.35	2 35

(ii)RSS claims from Organiser October 31 1999

Note Between 1981 and 1991 the Christian population increased by 16 89 per cent, the population of Hindus increased by 23 79 per cent and the Muslim population increased by 32 76 per cent

An interesting aspect of the data for the northeastern States is that there was a sharp decline in the number of people who told the enumerators that they were from "other religions and persuasions". This category would include those who maintain their tribal identity, worshipping local deities, and whose beliefs and practices would be far-removed from mainstream Hindu practices and rituals. In Arunachal Pradesh this category accounted for more than 50 per cent of the population in 1981; in 1991, people with "other religions and persuasions" accounted for only 36 per cent. While the Hindu population increased sharply in some districts, the Christian population increased in some others. This trend in the decline of the percentage of people with such beliefs is in line with the historical tendency of mainstream religions to make inroads into such communities.

Historian Sumit Sarkar points out that "Sanskritisation" or "cultural integration" of marginal groups and tribals were often termed "*shuddhi*", "reclamation" or "*paravartan*" (the Vishwa Hindu Parishad's preferred term for getting these groups back into Hindu society) and is not substantially different from the term "conversion" (Sumit Sarkar, *Economic and Political Weekly*, June 26, 1999). Sumit Sarkar also elaborates on the point made by Richard Eaton in his study of the rise of Islam in Bengal "that in large parts of the subcontinent, certainly in medieval times and to a considerable extent even today, the great religious traditions have been expanding at the cost, not so much of each other as in relation to a multitude of local cults or practices." He emphasises the point that the potential for conflict in premodern times was far less because of the slow nature of the process. Moreover, the process in those times was not based on conversion of individuals but of whole groups, families, clans or local communities. This, he notes, reduced the scope for conflict. Such an explanation also contradicts the right-wing claims that the state, whether during Mughal rule or during British rule, played the major role as a facilitator in the spread of Islam or Christianity.

Data available from the National Family Health Survey conducted in 1992-93 reveal some patterns across the various religious communities. For instance, the rate of illiteracy was about

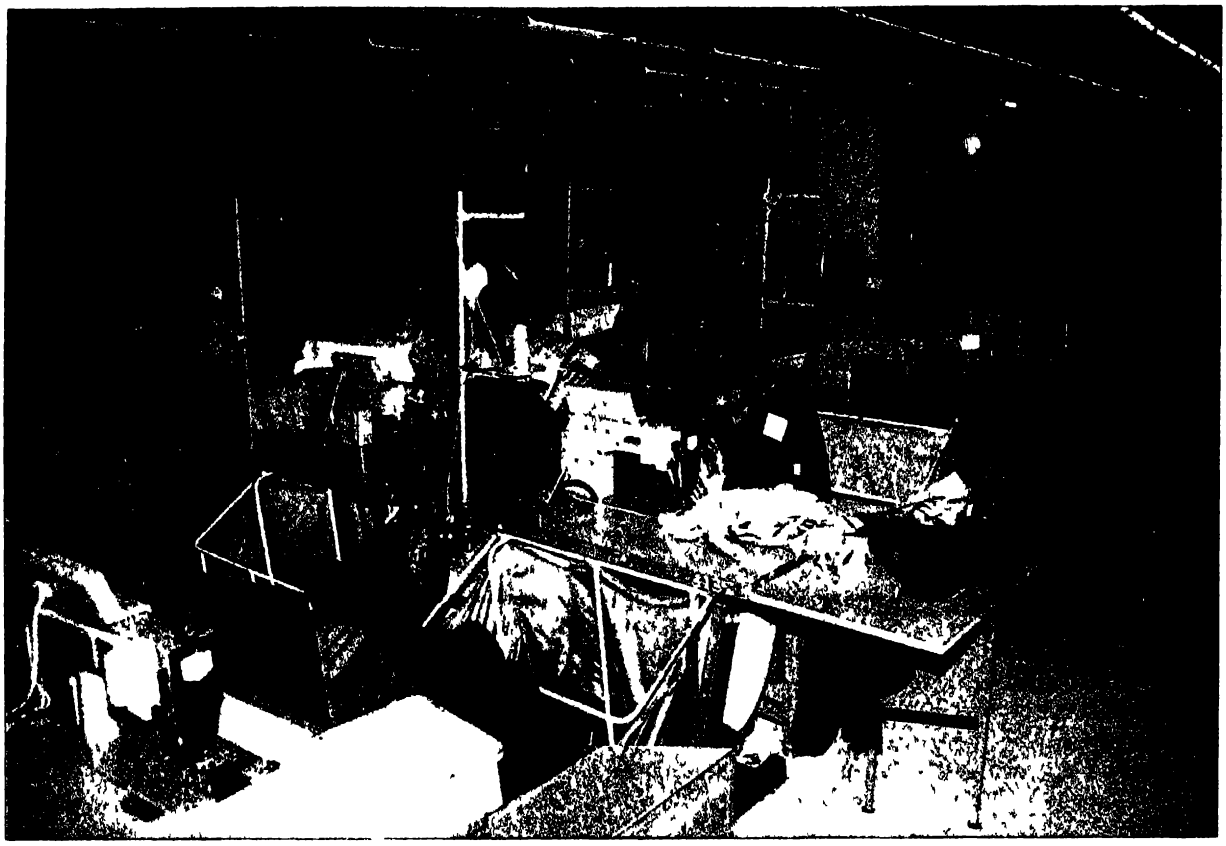
ANU PUSHKARNA

At the papal Mass in New Delhi on November 7. Census data indicate that conversions are an insignificant factor in the demographic transition of Christians in India.

33 per cent among Christians, compared to 64 per cent among Hindus. Nearly 8 per cent of the Christian population had studied above the high school level, compared to 3.4 per cent among Hindus. The empowering aspect of the figures is brought out by these figures: nearly half the Christian women surveyed knew the legal minimum age for marriage, compared to 32.5 per cent among Hindu women.

The results of the survey show that the Christian population in India also has better access to health care. Neonatal mortality among Hindus was estimated at 55 per thousand live births, compared to 32.6 per thousand live births among Christians. Post-neonatal mortality rates were estimated at 35.4 per thousand live births for Hindus, compared to 17.3 per thousand for Christians, while the infant mortality rate for Hindus was 90.4 per thousand live births compared to 49.9 per thousand live births among Christians. The child mortality rate was estimated at 19.4 per thousand live births among Christians while for Hindus it was 36.9 per thousand live births. More than 60 per cent of those surveyed among Christians reported that they received antenatal care from a doctor, compared to only 38.6 per cent among Hindus. A comparison of the Total Fertility Rate (TFR), the measure of the average number of children delivered by a woman during her reproductive life, among Hindus and Christians also indicates a gap among the two communities. While the TFR for the Christian population was 2.87 in 1992-93, it was 3.3 for Hindus. The obvious conclusion is that the Christian population had better access to medical facilities compared to the rest of the population. Obviously, the death rate among Christians was far lower than in the rest of the population – 8.2 per cent, compared to 12.9 per cent among Hindus (figures for 1984).

The rate of growth of the Christian population in India was high between 1921 and 1971; in fact, between 1921 and 1971, the rate of growth of the Christian population was consistently higher than that of the total population, although the gap narrowed in successive rounds of the Census. However, since 1981, this trend has been reversed. While the population of India increased by almost 24 per cent between 1981 and 1991, the Christian population grew by 17 per cent.



It is clear that the Christian population in India is well on its way towards a demographic transition. Principles of demography show that the first impact of development is on the death rate, reducing it by the delivery of modern medicine to combat the basic diseases. However, the birth rate takes longer to slow down because it is in part a function of literacy, particularly among women, and other long-term factors. It is quite plausible that the natural rate of growth of the Christian population up to 1971 was higher because of the sharper decline in the death rate among Christians when compared to the rest of the population. However, since then, exposure to literacy and other factors, particularly among women, appear to have set the birth rate on a declining trend. This would have caused the natural rate of growth of the Christian population to slow down. The unwinding of this process means that the natural rate of growth of the Christian population is likely to slow down even more in relation to the rest of the population.

What this means in terms of the logic of the Sangh Parivar is that if the Christian population has to catch up, it has to rely increasingly on conversions. The fact that the proportion of Christians in the population has increased by just half a percentage point in the last 70 years shows the absurdity of such fears. The Christian population accounts for only 2.5 per cent of the total population almost 2000 years after the religion reached India.

It is obvious that much of the advancement in the living conditions of the Christian population has been because of missionary activity – not confined to conversion in the narrow sense, but also in reaching literacy, health care and other basic empowering resources to the poor. That the state has failed to reach these basic fruits of development to large sections of the people is the obvious corollary. ■

Global double standards

While non-competitive and decaying industries in Western countries cry for universal labour standard, more buoyant Western industries looking for new areas of operation seek the dilution of labour laws.

K PICHUMANI

The criticism of rich countries for their attempt to impose "labour standard" on poor countries does not take away from the fact that the working conditions of Indian workers are sometimes appalling.

BIPLAB DASGUPTA

THE first official Commission, established in 1895, to inquire into the conditions of workers in the Indian jute industry, was inspired by the industry's global rivals, the jute textile industry of Britain, located in Dundee, Scotland.[1] The management of both was in the hands of the British, more specifically Scottish, but the managements were sworn enemies. The Indian industry was seen by its Scottish rivals as an intruder in a field that they looked upon as their exclusive preserve. The interest they took in the labour conditions in the Indian jute industry was prompted less by their concern for the low wages and poor working conditions of the Indian proletariat than by the fear that the Dundee industry would be swamped by products from this cheap source and its survival would be threatened.

THE issue of "labour standard", which the rich countries are pushing for acceptance at the World Trade Organisation (WTO) ministerial conference in Seattle, to begin on November 30, is prompted by the same capitalist desire to keep away competition from cheap sources. The rich countries are proposing a set of global rules that would standardise labour market behaviour and establish some parity in terms of the wages paid and the conditions under which they operate. The argument in support of such standardisation is that low wages are conferring on the poor countries a differential advantage in global trade and that such differential is unfair and is threatening many industries of the rich countries.

Such a partisan view ignores what is obvious. The wage level of a country cannot be independent of the overall state of its economy and its per capita gross national product (GNP). There can be no mechanical parity of wages between, say, Japan and India when the former's per capita income is one hundred times more than India's. To demand that the wages paid in India should be made com-

1. Daniel Houston Buchanan, *The Development of Capitalistic Enterprise in India*, Frank Cass & Co, London, 1966 (first edition 1934), p. 421.

parable with those paid in rich countries would amount to driving Indian exports out of the world market.

It can also be argued that poor countries like India, having little capital, technology and management resources, enjoy an advantage over the rich countries only in terms of the prevailing low wages. To force them to adopt Western wage levels would ruin their industries and take away whatever little chance they still have in making some of their products competitive in the world market. It might also be asked why the rich countries should grudge this very small advantage the poor countries have over them when they dominate world trade comprehensively and ruthlessly. The share of poor countries in global trade is pitifully small and is getting ever smaller. The terms of trade are consistently against poor countries as they keep on producing and exporting more to earn less. Activities that are ancillary to trade, such as shipping and insurance, are under the near-absolute control of the rich countries, while multinational companies (MNCs) decide, in the case of most poor countries, what to produce and what to sell.

The criticism of rich countries for their attempt to impose "labour standard" on poor countries does not take away the fact that the conditions in which Indian workers work are appalling. Many of the issues the Dundee competitors raised in the 1890s regarding conditions of work in the Indian jute industry were undeniable, nor was there anything wrong in the support, monetary and otherwise, their trade unions gave to their Indian counterparts. The management has always been reluctant to share the profit with those who toil on the floor, while the unpardonable crime of employment of child labour continues. But the analysis above serves the purpose of providing a global perspective. The International Labour Organisation (ILO) rightly takes the view that the provision of social insurance and social protection are basic human rights.[2]

THE controversy over labour standards is yet another manifestation of two current global tendencies, both emanating from the rich countries and harmful to the interests of the poor countries. The first is the tendency to universalise and standardise everything in terms of a set of global rules that are framed mainly by the rich countries with the interests of their own MNCs in focus. Whether it is patents, investment, competition policy, labour or the environment, an obsessive and vulgar desire to bind the world with a uniform set of rules is evident. Such an attempt at standardisation ignores the wide divergence that exists between countries in terms of the level of development, resource endowment, human resource, historical background, and what not. Such standardisation is also opposed to the spirit of the 1993 Convention on Biodiversity, which followed the Rio Earth Summit and emphasised on diversity (and not conformity) as something essential for the sustenance of life on this planet.

TOWARDS SEATTLE

The second tendency is to subordinate the United Nations and its affiliated bodies to agencies promoted by Group of Seven (G-7) countries and the powerful global trinity of the World Bank, the International Monetary Fund (IMF) and the WTO, organisations which are effectively owned/controlled by the former and which share a market-oriented economic philosophy. The WTO now deals with matters such as investment, patents, agriculture, the environment and labour, which should have been left to specialised U.N. institutions that were created in response to specific needs – for instance, the United Nations Industrial Development Organisation (UNIDO), the World Intellectual Property Organisation (WIPO), the Food and Agriculture Organisation (FAO), the United Nations Environment Programme (UNEP) and the ILO. Almost all these U.N.-affiliated organisations had for a long time opposed the various aspects of globalisation sponsored by the trinity, though, over the past few years, with intense pressure from G-7 countries, almost all of them have been brought in line with the economic philosophy of the trinity. While, in the original format of 1944, the World Bank and the IMF were supposed to report their activities to the Economic and Social Council of the United Nations (ECOSOC), this was never done. The agenda of various U.N. bodies has been hijacked by the institutions patronised by G-7 countries, so much so that today people hardly know of the ECOSOC, but, whether they love it or hate it, the trinity influences their lives. The G-7's preference for the trinity over the United Nations and their active financial and political patronage of the former in comparison with the latter is understandable because by their voting power and otherwise they control the trinity more easily.[3]

THE trinity's concern for free trade and global mobility of capital, inputs and products does not mean support for a free flow of labour power across national frontiers. If anything, over the past three decades, immigration laws in the rich countries have become more rigid and their implementation more severe against labour exports from poor countries. Unlike capital and products that are supposed to move from anywhere to anywhere in response to demand, movement of people from labour-surplus areas to labour-deficit ones is actively discouraged. Obviously, what is desirable in terms of the philosophy of free trade in the case of capital, one major factor of production, does not apply to labour, another and no less important a factor. To complete the argument one should add that land, the third major factor of production, is incapable of moving across frontiers.

If capital is to be given "national treatment" and freed from discrimination in favour of local enterprises under TRIMs (Trade-Related aspects of Investment Measures), why should labour, irrespective of its source, not enjoy a similar "national treatment" and protection from discrimination? The argument that unrestricted flow of labour would adversely affect the local population and their culture in rich countries is analogous to the "local content requirement" argument that was used by many countries, including India and East Asian countries, during the pre-1991 period (it is banned by the WTO now) against foreign capital, asking the foreign investor to give priority to local manpower and materials. It cannot be that "local content requirement" is bad for capital and good for labour, while "national treatment" is good for capital but bad for labour. Obviously, the global trinity's love for free trade is confined to the factor the rich

2. Roger Plant, *Labour Standards & Structural Adjustment*, ILO, Geneva, 1994, p.57.
3. Biplab Dasgupta, *Structural Adjustment, Global Trade and the New Political Economy of Development*, Sage (Delhi) and Zed Books (London), 1998, Chapter IV on Structural Adjustment.

countries have in plenty, that is, capital, and does not extend to labour, which the poor countries have in plenty.

THERE is, however, a serious conflict between two types of views on labour use, which are yet to be reconciled – again both emanating from the rich countries. For the purpose of this article, they can be described as "protectionist" and "liberal" views. While "labour standard" is essentially a protectionist argument to ensure the survival of many of the inefficient and non-viable industries in rich countries, particularly leather and textile industries, there are other western industries that are stronger and are keen to enter the markets of poor countries. The latter, in fact, argue for a completely different set of labour policies in the poor countries, that is, for the dilution of existing labour laws that protect the interests of workers, for instance, laws on minimum wages, job security against lay-offs and closures, the right for better working conditions, compensation in case of injuries, provident funds, and trade union rights. The objective here is to ensure that MNC investments are not hindered by restrictive labour laws. This is more in line with the orthodox view on liberalisation, which is by its very nature anti-trade union. These industries argue that the existing labour laws do not allow flexibility in the operation of an enterprise, that is, they do not allow wages to fall or the workers to be sacked, as and when needed, in order to balance demand with supply.

How to resolve this contradiction, between those who favour a universal labour standard that can be brought about by elaborate labour legislation, and those who seek as much dilution of labour laws as possible, and between the non-competitive, non-viable, decaying Western industries gasping for breath and the more buoyant Western ones searching for new markets, is a matter to be pondered over by the G-7 countries. However, it is in the interest of the poor countries to point out this contradiction.

To demand that the wages paid in India should be made comparable with those paid in rich countries would amount to driving Indian exports out of the world market.

Some of those who take this second, liberal view and seek the dilution of labour laws even prescribe a complete overhauling of the labour market, with "labour power" rather than the "labourer" as the focus. They argue for the replacement of regular labourers who work for a scheduled number of hours in a day and for a scheduled number of days in a week by "flexi-time workers", whose contribution would be measured by "hours" and who would not be required to stick to a given time format. This, they claim, would improve efficiency as it would no longer be necessary for an enterprise to carry permanent workers on the pay roll even when the demand for its product declines.[4] Those who advocate a competitive labour market, with completely flexible movement of wages, both upward and downward, in response to demand, mainly seek the right to hire and fire and to close down non-viable units.[5]

Those who are opposed to such radical change in the pattern of labour use point to the Japanese example, where a person is recruited for life, and seniority, rather than merit, determines the grant of promotion. The Japanese model, based on a stable and regular workforce, has cemented the bond between the worker and the management, while no such loyalty is expected from flexi-time workers, they argue.[6] It is also established that governments, which are otherwise keen to carry out labour market reform in line with the "structural adjustment" package of the Bretton Woods twins often find it politically risky to implement a radical change.[7]

ONE major impact of globalisation on labour use and the labour market that has serious implications for a country like India is rarely, if ever, discussed. This relates to the distorting impact of MNC salaries on the wage structure for the country as a whole. With the entry of the multinationals, the pay structure for the higher levels of management has been catapulted to a very high level. Although not on a par with salaries for the same jobs in the rich countries, these are now high enough to make the ablest of the skilled workforce to gravitate towards them in the poor countries. This is forcing non-MNC companies, in their turn, to raise the salaries of their own management staff to MNC levels, realising that not to do so in this age of globalisation would mean losing them to MNCs.

Two major consequences follow from these. First, the economy is divided clearly into those enterprises which can offer MNC-level salaries to their professionals and managers and those who cannot. Secondly, the disparity between the highest paid and the lowest paid within the same enterprise is widening alarmingly. The company's balance sheet, while capable of offering astronomical salaries to a few, would not allow similar increases in the salaries and wages of other employees. While the ratio between the highest paid and the lowest paid is around 30:1 in the rich countries and 10:1 in East Asia, it is around 100:1 in many Indian enterprises. Such gross inequality is not sustainable and is bound to lead to widespread industrial unrest. The Indian companies are thus facing a serious dilemma as it is not easy to reduce this disparity – either by raising the wages of the lower order, given their vast number, or by restraining wage increases at higher level, in view of the global competition. ■

China into the WTO

A Sino-U.S. agreement clears the way for China to be admitted into the World Trade Organisation, but it is hard to believe that China would go the whole hog in the matter.

C.P.CHANDRASEKHAR

WHAT seemed inevitable for almost two decades, finally seems imminent. The mid-November Sino-U.S. agreement over the terms on which the U.S. would support China's entry into the 135-member World Trade Organisation (WTO), paves the way for the quick accession of that country into the world trading arrangement. The Chinese Government would of course have to win the support of many other members as well. Under the rules governing the WTO, where voting rights are distributed on the one-nation, one-vote principle and which follows the convention of taking decisions by consensus, the general council or a ministerial conference has to approve a membership treaty drafted after agreement with all members on the terms of accession. This requires, in principle, bilateral deals with all member-countries. While quite a few countries had virtually unconditionally backed China's request for membership, 12 formal bilateral deals have been inked so far and negotiations are open with another 28 countries and groups, including the European Union. However, for political reasons, agreement with the U.S. was considered a major stumbling block. With that block having been cleared, full agreement is widely expected to follow soon, even if not in time for the Seattle ministerial meet starting on November 30.

To most China-watchers, this outcome had seemed inevitable once it was clear that the Chinese economic reform which began in 1978 would remain in place. This view was buttressed by the fact that, despite China's exclusion from the formal world trading arrangement during the 1980s and 1990s, exports constituted a major plank of its growth strategy under reform. The share of merchandise trade in China's aggregate product rose from 9.2 per cent in 1978 to 16.8 per cent in 1984 and more than 20 per cent in the mid-1990s.

This dependence on trade implied a growing engagement of world markets. China's share of world merchandise exports, which stood at between 0.7 and 0.8 per cent during the 1970s, rose to 1.4 per cent in 1983 and stood at 2.9 per cent in 1996. In that year, China's share was higher than that of other leading developing country exporters such as South Korea (2.5 per cent), Singapore (2.4 per cent), Taiwan (2.2 per cent) and Mexico (1.8 per cent). With exports constituting the goal of an important segment of domestic economic activity and China's presence in the international markets increasing, it no more appeared sensible for China to remain vulnerable to unilateral trade policy responses and tenuous bilateral arrangements. The dangers were epitomised by the debates which surrounded the annual exercise since 1974 in which the U.S. Congress had to ratify continuing a normal trading relationship with China.

Not surprisingly, China declared in 1986 that it would like to be part of the multilateral framework governing world trade. The fact that China's accession is finally in sight only 13 years later is not primarily due to its own recalcitrance. There have been occasions when China has on many trade-related issues been willing to go further in the direction of liberalisation than developing countries participating in the multilateral trading arrangement. In fact, in the dispute over patent regimes during the later stages of the negotiations that led up to the Uruguay Round agreement, China's willingness to compromise at a bilateral level was quoted to smother developing-country opposition and buttress developed-country positions. What held back the final agreement were complex political and economic compulsions in the developed countries, especially in the U.S.

That such compulsions played a role is clear from the fact that as recently as April, President Clinton turned down terms offered by China in return for U.S. support for its entry, which were no different from those underlying the latest agreement. Those terms were by no means limited.

To start with, it involves a substantial degree of liberalisation of trade. China's average import tariffs are to be reduced by almost 5 percentage points, from 22.1 per cent to 17 per cent. Tariffs on some farm products exported by the U.S. are to be reduced sharply to 15 per cent. And tariffs on automobiles, currently ranging up to 100 per cent, are to be subject to a "front-loaded" reduction to 25 per cent over a six-year period.

Secondly, the package offers a number of concessions for foreign firms and investors. For example, international automobile manufacturers and banks would be allowed to offer consumer loans for car purchases, which is a crucial concession given the high price of automobiles in China relative to incomes. Foreign manufacturers will also be allowed to distribute their own products imported from abroad and not be forced to rely on domestic distributors. Above all, foreign firms are to be provided an important role in the emerging and rapidly growing telecommunications sector (including the Internet). The agreement provides for foreign firms to hold 49 per cent of the equity in local ventures for a period of two years and 50 per cent subsequently.

The third area in which major concessions have been offered is the financial sector. Thus far, foreign banks were allowed to offer their services to foreign companies operating in China. But under the terms of the agreement they would be allowed to offer their services to Chinese firms two years after their entry, providing loans, undertaking currency transactions and servicing their other banking requirements. Limits on the insurance business undertaken by foreign insurance companies are also to be gradually dismantled and they are to be allowed to increase the number and expand the size of their branches as well as enter new areas such as property. Market access is to be eased and enlarged for foreign legal and accounting firms. Finally, foreign brokerage houses and mutual funds are to be allowed to form joint ventures with Chinese companies, holding 33 per cent equity initially and a possible 49 per cent subsequently.

In return for these substantial concessions, the U.S. has agreed to support

China's claim to WTO membership. But it has not offered very much else. In the contentious area of textiles, which is a major item in the Chinese export basket, quotas are to be phased out only by 2005. The U.S. has also reserved for itself the right to respond in protectionist fashion to what it sees as import surges in the U.S. market, for a period of ten years, and to respond similarly to "dumping" for a period of 15 years. The experience under the Uruguay Round so far points to the ease with which such clauses can be converted into protectionist devices by developed countries.

THE willingness of China, an important developing country exporter which has been struggling to join the formal multilateral trade framework, to make these compromises is to an extent understandable. What is less clear is why the U.S. which for political reasons was earlier unwilling to accept even these terms, has suddenly come round to accepting an agreement which according to some reports is not as good as the terms which were on offer and were rejected in April. Moreover, given the impending presidential elections and the strong opposition among the trade unions to Chinese entry, the timing of the agreement is indeed surprising. AFL-CIO, the American Federation of Labour and Congress of Industrial Organisations, has vowed to fight the deal, because it threatens American jobs and goes against America's "democratic principles and most cherished values".

And some local business interests, including the textile lobby, have sharply attacked the agreement.

If yet the Clinton administration has chosen to go through with it, it is possibly because of a strategic concern. It is indeed pointless not integrating an emerging economic power like China into current and future negotiations on the world trading system. But, more important, the willingness of China to make crucial concessions in areas like foreign investment and the financial sector could be an important source of pressure on recalcitrant developing countries unwilling to agree to start negotiations on investment and services, as part of a new round. That could possibly explain the willingness to conclude an agreement on terms rejected only recently, in time for the ministerial meet in Seattle. As in the case of patents at the time of the Uruguay Round, China is implicitly being held up as a model of a developing country with a reasonable negotiating position.

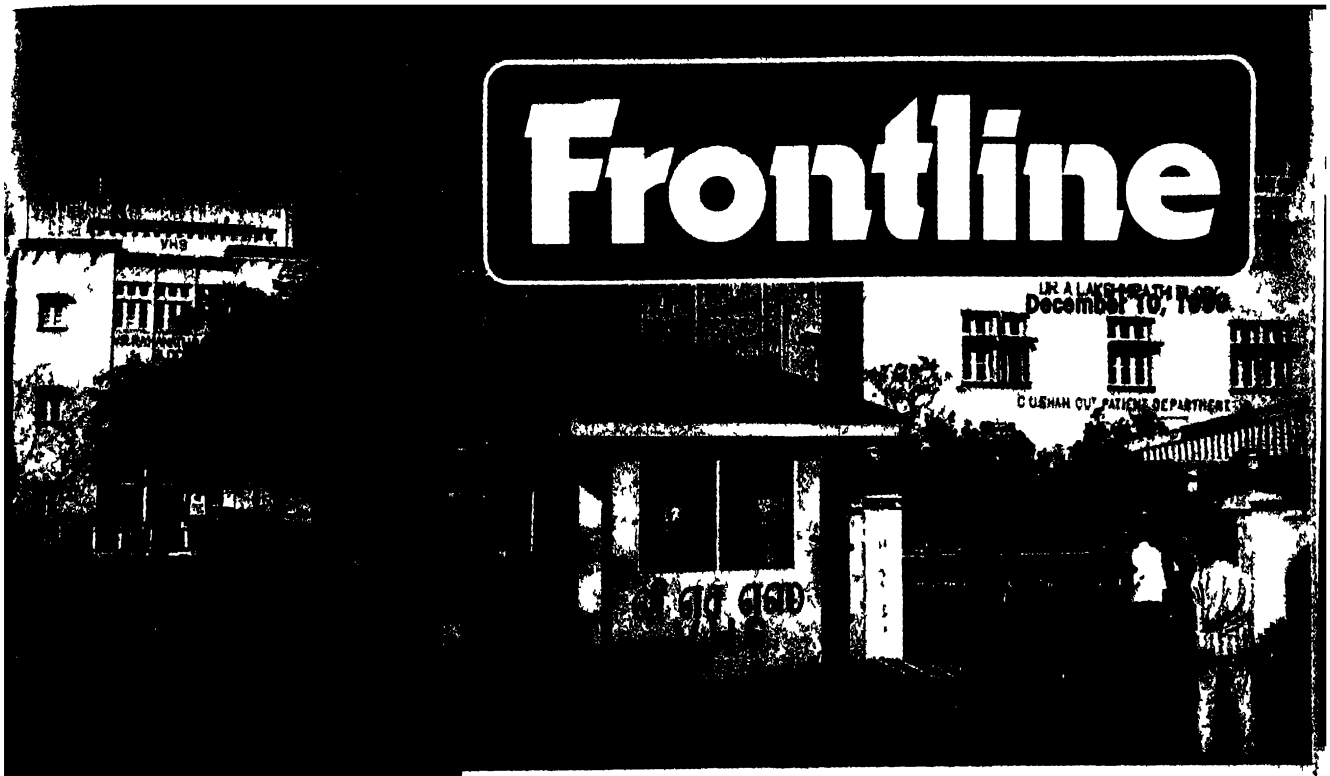
MATTERS, of course are far more complex. Given the political and legal structure in China, and autonomy of local governments especially after the reform, accepting an agreement is a far cry from implementing its provisions. Despite China's acceptance of strong patent rights regulations earlier than many developing countries, not only is reverse engineering the rule among Chinese firms, but international firms detecting patent or copyright violations are rarely in a position to challenge them and get the Chinese government to initiate action.

In fact, this time around, the consequences of implementing the provisions of the agreement relating to trade liberalisation can be extremely damaging, especially for the state-owned enterprises (SOEs) primarily created during the pre-reform years. There were 118,000 such firms in China in 1998. Although their contribution to China's industrial output had fallen from over 75 per cent in 1978 (when economic reform process began) to less than 35 per cent in 1995, this was not so much owing to the shrinkage of this sector as to the expansion in the rest of the industrial sector consisting of collective enterprises, individually owned enterprises, wholly foreign owned firms, and foreign joint ventures.

What is significant is that even now the SOEs dominate or even monopolise their chosen areas of operation, which are the capital-intensive, heavy and basic goods industries characterised by lumpy investments and long gestation lags.

The significance of the SOEs comes through in other ways as well. For example, they still constitute the principal source of employment in urban China. In 1995, seven out of ten urban workers were employed in state firms. Such employment does not ensure just a wage, but a range of welfare benefits such as housing, medical care and retirement benefits. Further, SOEs constitute the primary source of tax revenue for government. In 1995, SOEs produced only 35 per cent of China's industrial output but contributed 71 per cent of government revenues. Thus, it is not only directly that the SOEs contribute to the government's governance and welfare responsibilities, but indirectly, by providing the latter with the wherewithal to finance its own expenditures.

Trade liberalisation, which would subject these units to competition, and financial sector reform, which would make it extremely difficult for them to access the credit so crucial to their survival, mainly threatens these firms. Thus, the terms of WTO entry, if implemented, could spell unemployment and erode standards of living. According to China's official Xinhua News Agency, China's Labour Minister Zhang Zuoji stated in a report to the financial and economic committee of the National People's Congress earlier this year that more than three million workers in the SOEs are expected to lose their jobs this year. They would join the six to seven million people who, having been retrenched from state firms, are yet to find new jobs. Zhang noted that while China would need 24.5 billion yuan ($2.95 billion) this year to provide basic living expenses to laid-off workers, the amount currently available was only 19.5 billion yuan. This problem of inadequate support is bound to intensify if China resorts to massive trade and financial sector liberalisation involving partial retrenchment or closure of public sector units, since there were an estimated 113 million urban workers employed by state-owned firms in 1995.



It is for this reason that it is hard to believe that China would go ahead with the kind of liberalisation it has promised on a range of fronts. In fact, there are many China watchers who are sceptical. For example, the *Financial Times* quoted Gordon Chang, a lawyer in a Beijing firm, as saying: "If it (China) really follows through on the agreement, the changes are going to be little short of revolutionary. This leads me to believe that the agreement is not going to be implemented as announced."

In the circumstances, the view that all developing countries should give in to a more liberal (though unequal) global order just as China has done may be misplaced. China's giving in may be more rhetorical than real. And the competitive threat to developing countries from China, which has been intense in the past, is unlikely to increase after China's entry into the WTO.

Unfortunately, misplaced views about the implications of China's entry are being aired in India as well, in defence of the position that India should 'learn from China' and not insist on a review of the Uruguay Round and raise too many objections to a Millennium Round with a far-reaching agenda. But as in the case of developed-country spokespersons, this is just one more ruse to push through their own agenda. ■

AIDS Prevention & Control in Tamil Nadu

What makes a love story ?

Passion. Peace of Mind. And Protection.

True love can be expressed in many forms. And using a condom is one of the best ways to show you love and you care

Condoms are your best protection against unwanted pregnancies and sexually transmitted diseases including AIDS And this security can certainly add to the pleasure of making love

Today condoms come with different features to add to your fun and pleasure And they are comparable in quality to the best condoms made anywhere in the world

So the next time you think of making love do it safely Just pick up some condoms You ll see how it makes your love story complete

Focus on AIDS prevention

The success of the AIDS awareness and prevention programme in Tamil Nadu, spearheaded by the AIDS Prevention and Control Project at the Voluntary Health Services and the Tamil Nadu State AIDS Control Society, owes much to a multi-sectoral approach, involving the government, the private sector, non-governmental organisations, professionals and the public.

ASHA KRISHNAKUMAR
in Chennai

THE human immunodeficiency virus (HIV), which causes Acquired Immune Deficiency Syndrome (AIDS) and which still eludes a cure, claims 2.5 million lives and infects six million persons worldwide every year. Shattering lives, tearing apart families and decimating entire communities, the AIDS pandemic has killed 14 million people since it was first detected in 1984. The virus has infected 33.4 million people all over the world, but largely in the developing countries, which, unlike developed countries, can hardly bear the burden of the disease. Over 95 per cent of the HIV-infected people live in developing countries, which account for less than 10 per cent of the global gross national product. The rate of HIV propagation in these countries is also very high.

M. MOORTHY

On an arterial road in Chennai, a billboard with an AIDS awareness message.

AIDS was classified as a disease in 1981 and HIV identified as its cause in 1984. HIV attacks and destroys certain white blood cells, the T4 lymphocytes, that are crucial to the body's immune system. The virus is transmitted primarily through unprotected sexual activity; contaminated blood and blood products, tissues and organs; and contaminated needles, syringes and other piercing instruments; and from mother to child.

The primary mode of transmission, however, varies from one country to another, and even within a country. In Tamil Nadu, which is one of the three epicentres' of AIDS and HIV infection in India, 74 per cent of HIV infections are caused by heterosexual sex, 7 per cent occur through blood products, 8 per cent owing to drug abuse and the rest through other modes such as transfer from mother to child.

According to current knowledge, HIV does not survive outside the human body, and so the virus is not transmitted by merely hugging or shaking hands, by sharing utensils, or in other everyday circumstances. HIV is not known to be transmitted through mosquito or insect bites.

There are two types of HIV – HIV-1 and HIV-2. Both reproduce using the genetic materials of the cells they invade and gradually disable the body's immune system. Both mutate and appear to have different subtypes, each with significant variations; this makes it virtually impossible to develop a universal drug or a vaccine.

INDIA has the largest number of HIV-infected persons among the countries of the world – about four million. AIDS was first reported in India in 1986, in Chennai and in Vellore. Maharashtra, Manipur and Tamil Nadu have emerged as epicentres of HIV infection in the country, together accounting for three-fourths of the AIDS cases and two-thirds of the HIV infections. Maharashtra accounts for half the HIV cases. While the infection cuts across age and sex divisions, it occurs most frequently in the 15-45 age group (90 per cent) and among men (79 per cent).

Although national-level surveillance data on the disease are patchy, recent surveys in some pockets are revealing. For instance, the infection rate among pregnant women in Pondicherry has increased from insignificant levels in 1992 to 4 per cent in 1999. Among truck drivers in Chennai, the incidence of HIV infection quadrupled from 1.5 per cent in 1995 to 6.2 per cent in 1996. In Manipur, some drug-detoxification clinics reported that 70 per cent of their patients were HIV-positive.

According to the 1998 national sentinel surveys conducted by the National AIDS Control Organisation (NACO), the epidemic has spread all over the country, from the urban to the rural areas, and from the high-risk groups (truck drivers, commercial sex workers, intravenous drug users, homosexuals and persons with promiscuous sexual

THERE IS LIFE AFTER HIV

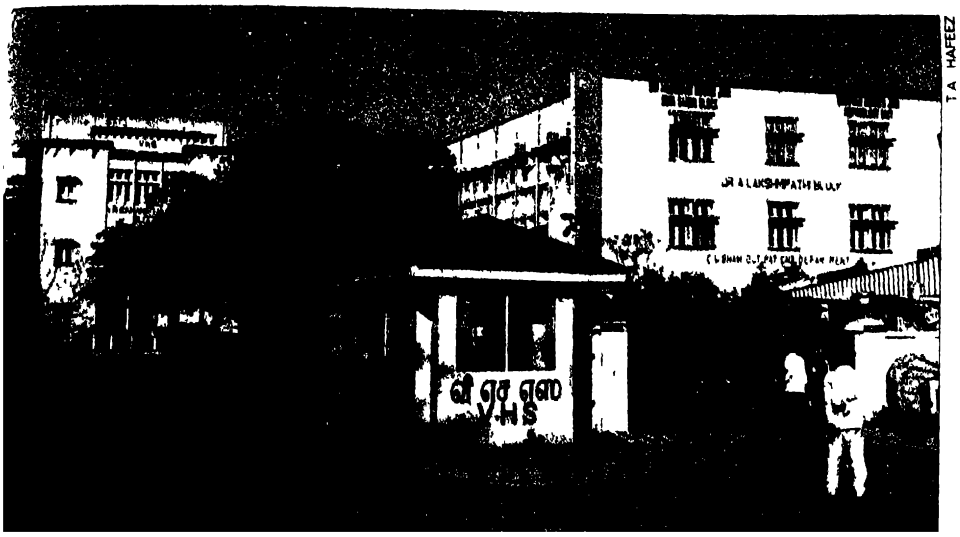
It is true that if you catch it, there is no return ticket. But, once infected, a person may live with the virus for another 10 to 15 years. When they are down with opportunistic infections, they have to resort to a hospital. Often despised by the society, they live with the stigma, although they might have got it by blood transfusions or from a wayward husband. Children are born with HIV, contracted from an infected mother. Many lives are ruined for no fault of theirs

At Meenakshi Mission Hospital and Research Centre, Madurai, we take care of all the HIV/AIDS patients, whatever be the way of transmission. Ours is the first and the only private hospital in Southern Tamil Nadu that cared to admit AIDS patients for continuum care. This ward is named after Mother Teresa and is run with the assistance of Tamil Nadu State AIDS Control Society.

MMHRC is committed to the cause of AIDS. In 1996, we started training health care providers in counselling patients with sexually transmitted diseases. This year, we have initiated the Regional STD / HIV / AIDS Infotech Centre Both these programmes are sponsored by the AIDS Prevention and Control (APAC) Project of Voluntary Health Services, Chennai funded by USAID.

There are more than 5 lakh HIV carriers in Tamil Nadu They are going to live for the next 10 to 15 years

Think about it.



Who will provide them costly medicines to control infections? Neglected and helpless, they are not even permitted entry in many hospitals in our country.

HIV prevalence trends in Tamil Nadu (1993-1999)

(in per cent)

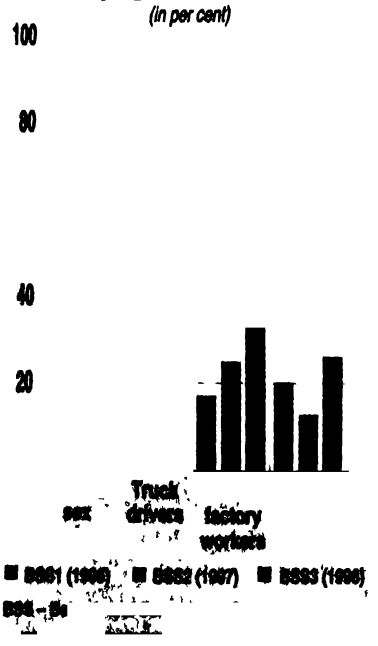
Source APAC-VHS

behaviour) to the general population. There has been a rise in perinatal transmission of the virus, alongside an increase in HIV incidence among women who come to antenatal clinics. According to the survey, one in every four HIV cases reported involves a woman.

According to the World Health Organisation (WHO), over half of all newly infected adults globally are women. The number of infected women is expected to increase from six million now to 13 million by 2000. Women are particularly vulnerable to the disease because of their vulnerability and subordination in sexual, economic and social terms.

Over 90 per cent of the under-15 HIV-infected trace the cause of infection to infected mothers. According to the United Nations AIDS Programme (UNAIDS), since the early 1980s three million under-15 children have tested HIV-positive globally. In 1996, it was estimated that 1,000 children died of AIDS every day the world over. At the end of 1997, there were over one million HIV-infected children, 90 per cent of them in the developing countries.

LETHAL as it is, HIV has a dangerous tendency to coalesce with tuberculosis(TB)-causing bacilli and co-infect individuals. The WHO estimates that at least 4.5 million people (98 per cent of whom are in the developing countries) are infected with both HIV and TB. According to the WHO, the TB bacterium can activate HIV from a latent state in infected cells. TB chemoprophylaxis, a regimen of administering anti-TB drugs to HIV-positive people to prevent the onset of active TB, can save tens of thousands of lives and simultaneously help curb the spread of the HIV epidemic.



In the absence of a cure, the only way to check the spread of AIDS is to take preventive steps to check the spread of HIV. Actively involved in this effort are various international organisations, such as the World Bank, the WHO, UNAIDS, the United Nations Development Programme (UNDP), the United States Agency for International Development (USAID), the Ford Foundation, the Department for International Development (DFID), the Norwegian Agency for Development (NORAD), the Australian Agency for International Development (AUSAID), the Canadian International Development Agency (CIDA), the European Commission (E.C.), the United Nations Educational, Scientific and Cultural Organisation (UNESCO), the United Nations Population Fund (UNFPA) and the United Nations Children's Fund (UNICEF). USAID has been the global leader in finding ways to slow the spread of the AIDS pandemic over the last decade. It works in partnership with other international agencies, governments and non-governmental organisations (NGOs).

In India, a national AIDS control committee was set up in 1991 under the Union Ministry of Health and Family Welfare. The first phase of the National AIDS Control Programme was launched in September 1992 in order to evolve a comprehensive, multi-sectoral strategy for the management of the pandemic. It was implemented by the NACO and the AIDS cells in 32 States and Union Territories. The programme focussed on generating public awareness, conducting research and surveillance, supporting NGOs in reaching out to the target groups, promoting the use of condoms and ensuring blood safety.

Between 1992 and 1998, the Union Government and international donor agencies allocated a total of Rs.397 crores for AIDS awareness and prevention programmes in India. For the next five years,

Strategies for prevention

ASHA KRISHNAKUMAR

IN the absence of a cure or a vaccine for HIV/AIDS, the best strategy to deal with the scourge is prevention. The four major components involved in this approach are:

Generating awareness: There is a wide gap between disease awareness, knowledge and actual practice, largely because AIDS is an "invisible" disease, unlike malaria and tuberculosis, and because awareness campaigns have hitherto focussed largely on the importance of "condom use" and of being "faithful". Campaigns do not induce behavioural changes if the people do not understand the mode of spread of an infection or a disease, understand that a behavioural change will benefit them and are provided the support needed to make behavioural changes.

In Tamil Nadu, the awareness campaign targets the high-risk groups as well as the general population and uses a multimedia approach: television, radio, print, hoardings, advertisements, documentaries and folk songs, dance and theatre.

Promoting condom use: According to P. Arvind Kumar, a condom promotion specialist with APAC-VHS, in India HIV is transmitted predominantly through heterosexual activity, and promoting the use of quality condoms will control the spread of the pandemic. India is one of the largest manufacturers of condoms, but over 50 per cent of the condoms produced in India are exported to over 150 countries; per capita condom use in India is one of the lowest in the world. Arvind Kumar attributes this to the poor availability of condoms at retail shops, buyer inhibition and unfamiliarity with usage procedures. To make good-quality condoms easily accessible, APAC-VHS provides technical assistance to condom manufacturers to meet international quality standards, helps create awareness about condom use and markets condoms at subsidised rates.

To ensure better acceptance of condoms, APAC-VHS holds training programmes for retailers in collaboration with the National Institute of Sales, and for non-governmental organisations (NGOs) and health workers in collaboration with the Madurai-based Centre for Entrepreneur Development. Consequently, the number of condom outlets increased by 50 per cent in the last few years: there are now over 3,000 retail outlets in Tamil Nadu. Also, condoms are available at non-traditional outlets such as department stores, groceries and *pan* shops. The number of people using condoms has also increased dramatically over the last few years.

STD care: Studies by APAC-VHS show that people with sexually transmitted diseases (STDs) are 10 times more susceptible to HIV than others. Less than 10 per cent of STD patients get treated in government hospitals. Most STD patients ignore the problem or opt for self-medication owing to poor awareness or the lack of adequate women doctors. According to APAC Assistant Director Dr. N.Zafarullah, 15.8 per cent of the general population has one or other STD; 1.8 per cent of that number is HIV-infected. Treating STDs early is a sure way of reducing the number of HIV infections. To increase awareness of STDs and the treatment for them, APAC-VHS has trained over 4,000 health-care providers in Tamil Nadu in the last few years. APAC-VHS is also involved in setting up STD clinics in corporate and private hospitals.

Ensuring blood safety: As part of the measures adopted in Tamil Nadu to ensure blood safety, 815 blood banks have been modernised, and 40 blood-component-separation units set up; tests for HIV, hepatitis-B, syphilis and malaria have been made mandatory during blood donations; professional blood donations are being phased out and voluntary donations promoted; blood transfusion councils have been set up; and doctors and laboratory technicians have been trained.

BEHAVIOURAL SURVEILLANCE SURVEYS (BSS), which systematically monitor risk behaviour among people in the high-risk categories that spread the epidemic, have emerged as a critical component of the integrated surveillance package.

Changing risk behaviour through interventional strategies remains a key method to check the spread of HIV. Behavioural Surveillance Surveys provide the tool to monitor the success of these strategies.

Where the prevalence of HIV is still low, such surveys help identify the population groups that are most vulnerable to HIV infection and the sections that may be susceptible in future if preventive interventions are not initiated. This early warning may be important for Asian countries where HIV infection rates are low.

Behavioural Surveillance Surveys are generally repeated in the same cross-section of sub-population groups in relatively large geographical areas, and their data are meant to encapsulate broad-based behavioural trends.

In Tamil Nadu, where HIV infection rates are among the highest in the country, a BSS project by APAC-VHS has been monitoring behavioural trends since 1996 in several urban areas. Other findings of the survey include two important trends: reduction in the number of non-regular sex partners and increase in condom use among non-regular sex partners. ■

K. PICHUMANI

Condoms on sale at a general store.

Only you can prevent an STD patient from becoming an AIDS patient.

As a responsible member of the Medical Profession, caring for your patients is the most important thing in the world And you want nothing more than to see them completely cured And perhaps no other set of patients are as vulnerable as patients with a Sexually Transmitted Disease (STD) That is why it is important that you give them all the attention you can and the best advice possible Namely

- To make sure that they undergo complete treatment for the STD so that it is fully cured And warn them that repeated exposure of an STD condition (ulcers in the genitals) to high risk behaviour can make way for contracting AIDS
- To make sure that you include Partner Notification as part of your clinical advice and ensure that the patient brings his/her sexual partner for treatment
- So that the vicious cycle of the cured partner contracting the STD from his/her untreated partner is prevented
- Explain to them the differences between symptomatic and asymptomatic STD and explain all STD symptoms
- And advise them that a condom is the only protection against any STD including AIDS

Always use a condom

A message on the highway

T.S. SUBRAMANIAN

CONSIDERING the vulnerability of the lonely long-distanace truck driver to dangerous temptations along the road, AIDS-control strategies now routinely focus on getting the message of safety across to them. This involves setting up shop along busy highways, often at points where drivers stop for food at wayside eateries. One such centre is located at Sandhavelur, near Sunkuvarchatram, 65 km from Chennai, where literature on AIDS, sexually transmitted diseases (STDs) and condoms are handed out to members of the target population.

This evening, Madhes, 33, a truck driver, and Settu, 23, a cleaner, are being told in simple Tamil what AIDS is, what causes it, how it spreads and what are the ways to prevent contracting it. V. Kalidas, a field officer in the Indian Institute of Community Health, a non-governmental organisation that runs a project called Trucker-Highway Community Health Project (THCHP), tells them that people who have multiple sex partners, homosexuals, or people who use infected syringes are at high risk of contracting the virus that causes AIDS; the virus can also be passed through transfusion of contaminated blood. He uses flip charts and flash cards with pictures to educate them on HIV and STDs, and dispels myths. He then demonstrates the proper method of using a condom. Madhes and Settu's questions are answered, and after about 20 minutes, the two truckers hit the road again.

Under the THCHP, which is funded by International Family Health, London, counsellers advise truck drivers and cleaners, and commercial sex workers on the preventive steps that can avert STDs and AIDS. There are eight counselling centres under the THCHP: at Chembarampakkam and Sandhavelur on National Highway 4; Mamandur and Ulundurpet on NH 45; Perunthurai and Kaniyur, and Koratti (in Kerala) on NH 47; and Andalur Gate near Rasipuram on NH 7. The project at Sandhavelur was started three years back.

According to Kalidas, he and assistant field officer V. Karuppusamy educate about 35 truckers a day (from 7 p.m. to 1 a.m.) on sexually transmitted diseases and AIDS. Karuppusamy said the truckers' response was good. Kalidas added, "In particular, drivers and cleaners who are about to get married come to us for counselling."

Right opposite the THCHP counselling centre, next to another dhaba, is another AIDS Counselling Centre, run by Alternative for Indian Development, an NGO, and funded under the AIDS Prevention and Control Project (APAC) of the Voluntary Health Services (VHS). The centre was started two years back. Seated in a small room, surrounded by posters that list the symptoms of AIDS (rapid weight loss, dysentery, fever cough, itching and so on), field officers G. Venkatesan and R. Vasu said that their campaign to counsel truckers had had mixed reactions. "Some of them ignore us. Others get angry and ask us why we focus only on truck drivers and why there are such centres only on the highways," Venkatesan said. AIDS Counselling Centre has a strategy in place to spread awareness among drivers and cleaners: it has trained employees at petrol stations, dhabas, *pan* shops and vulcanising shops to spread AIDS awareness. These employees are called "peer educators".

Under the THCHP, condoms were sold at subsidised rates in petty shops along the highways. Truckers were also given a key-chain with a secret compartment in which to store the condom.

Dr. B. Arulmurugan, who is attached to the THCHP at Sandhavelur, said he treated about three to five men with STDs each day. If HIV infection is suspected, he refers patients to the Sri Ramachandra Medical College and Research Institute in Porur, near Chennai, or to Dr. Sunithi Solomon, YRG CARE (Centre for AIDS Research and Education), in Chennai, for treatment.

Kalidas and Karuppusamy said that drivers who were being treated for STD often did not get continuous treatment if they were put on a different route.

The Indian Institute of Community Health operated a mobile clinic in villages around Erode to provide medical treatment for commercial sex workers.

beginning 1999, Rs.1,155 crores has been allotted.

Tamil Nadu's AIDS awareness and prevention programme has been cited as a model by the NACO. The State's success can be traced to its multi-sectoral approach: the government, the private sector, NGOs, professionals and the general public work in collaboration to combat the problem. The nodal agencies for the AIDS prevention campaign in the State are the Voluntary Health Services Hospital, Chennai, which is the base for the USAID-funded AIDS Prevention and Control (APAC) Project, and the Tamil Nadu State AIDS Control Society (TNSACS).

The TNSACS programme is an experimental model for the NACO; it is the first project under the national programme which was started in 1994. The TNSACS, chaired by the State Health Secretary, works closely with the government.

The Voluntary Health Services Hospital, a non-profit institution started in 1963 with the objective of preventing and curing serious illnesses, is one of the few hospitals in Tamil Nadu that treat people infected with HIV or AIDS. It gets technical help for its AIDS treatment programme from the Chennai-based YRG CARE (Centre for AIDS Research and Education). Of its 400 beds, VHS has devoted 20 for HIV/AIDS patients.

THE mass media may help raise awareness about HIV and AIDS, but only inter-personal and interactive communication can induce behavioural changes that will check the spread of the disease. In this context the role of NGOs is crucial.

In Tamil Nadu, APAC-VHS provides financial and technical support to over 40 NGOs for targeted interventions among high-risk groups such as commercial sex workers, truck drivers and tourists. The NGOs educate the target population on the causes and effects of HIV/AIDS and other sexually transmitted diseases (STD) and the advantages and the method of condom use; they also train health care providers in identifying the symptoms of STDs and treating the diseases.

The behavioural surveillance surveys (BSS) undertaken by APAC-VHS at regular intervals show that the multi-sectoral and multi-media targeted approach has led to increased awareness and adoption

Proudly Announces

Training Programme on SOCIAL MARKETING OF CONDOMS

(An NGO Capacity Building Programme sponsored by USAID & VHS-APAC)

The Programme

The Programme is jointly designed by Administrative Staff College of India (ASCI), Hyderabad, Centre for Entrepreneur Development (Tamilnadu) and AIDS Prevention and Control Project (APAC),Chennai,with the support of USAID.

The objective is to train the NGOs engaged in health oriented projects to get an indepth orientation on Social Marketing Concept.An indepth analysis of issues related to HIV/ AIDS and effective use of condoms in the control of HIV / AIDS will make the participants confident of approaching the issue.

Eligibility

Senior staff of NGOs, Academicians and Consultants engaged in Social Marketing Sponsored by NGOs, Service Clubs like Rotary,Lions,Social Reformers and other Public Persons engaged in Health Related Issues.

[redacted]

This is a four day residential programme conducted at CED Training Campus,Madurai and CED plans to train 200 persons (in 20 member batches) through 10 Programmes in a span of two years. The next Programme is expected to be conducted by early December 1999.

[redacted]

The total cost of the Programme works out to Rs 3,000/- per participant. However, Fellowship is available from USAID & VHS-APAC, to the extent of Rs. 2,000/- per participant. Therefore, NGO participants need to pay only Rs.1,000/- per participant.This fee covers local conveyance, accomodation, course material, certification, boarding, lodging etc.

Working on a model programme

Interview with Dr. P. Krishnamurthy, APAC Project Director.

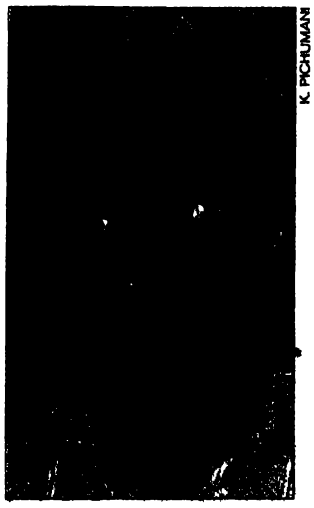
"AIDS is the fastest spreading pandemic in medical history and requires urgent action," says **Dr. P. Krishnamurthy**, Project Director of the AIDS Prevention and Control Project (APAC) based at the Voluntary Health Services Hospital in Chennai. APAC and the Tamil Nadu State AIDS Control Society (TNSACS) are the nodal agencies for the AIDS awareness and prevention programme in Tamil Nadu, which has been recognised as a model programme by the National AIDS Control Organisation (NACO).

Dr. Krishnamurthy, who has a background in public health, has been involved for a decade in AIDS control work undertaken by the Tamil Nadu Government and has been with APAC since its inception in September 1995. He was trained at the All India Institute of Hygiene and Public Health, Calcutta. He has presented several technical papers at international AIDS conferences. As part of his research work, he conducted a study of the behavioural pattern of the high-risk population and the prevalence of sexually transmitted diseases in Tamil Nadu. Dr. Krishnamurthy is a member of Monitoring the AIDS Pandemic, an international core group of 100 experts from 40 countries.

Dr. Krishnamurthy spoke to **Asha Krishnakumar** on the reasons for the spread of the AIDS pandemic, the ongoing research and other issues related to the problem. Excerpts from the interview:

▶ *When did the problem of AIDS surface and how did the disease spread?*

The problem of human immunodeficiency virus (HIV), which causes AIDS, has been around for over two decades. In India, it was first detected in September 1986 in Chennai by Dr. Suniti Solomon (then Professor of Microbiology at the Madras Medical College), and around the same time by Dr. Jacob T. John at the Christian Medical College Hospital, Vellore, Tamil Nadu. These two cases were detected when the doctors tested the blood of a few commercial sex workers. The first case of AIDS was identified around the same time in Mumbai. However, people refused to believe that the disease, which at that time was associated largely with promiscuity, could be prevalent in India: this denial arose largely from a moralistic point of view.



As health is a State subject, it was important that the State governments woke up and accepted the prevalence of the scourge. For many years, however, most States refused even to acknowledge its presence. This first stage of denial is part of the AIDS epidemiology globally. It is only now, after the scourge has spread across the country and among all groups of people, that State governments have accepted the presence of the problem.

In India, there are an estimated 30-40 lakh people with HIV. Of these, an estimated 4.5 lakh are in Tamil Nadu. Thus, a big chunk of the problem is in Tamil Nadu. The figures are increasing rapidly.

▶ *How has Tamil Nadu managed the problem?*

Tamil Nadu's AIDS prevention programme is recognised as the model by the National AIDS Control Organisation, the nodal agency for AIDS prevention and control in India, and by international agencies. Tamil Nadu government officials who are involved with the AIDS prevention programme now plan strategies for control programmes in other States.

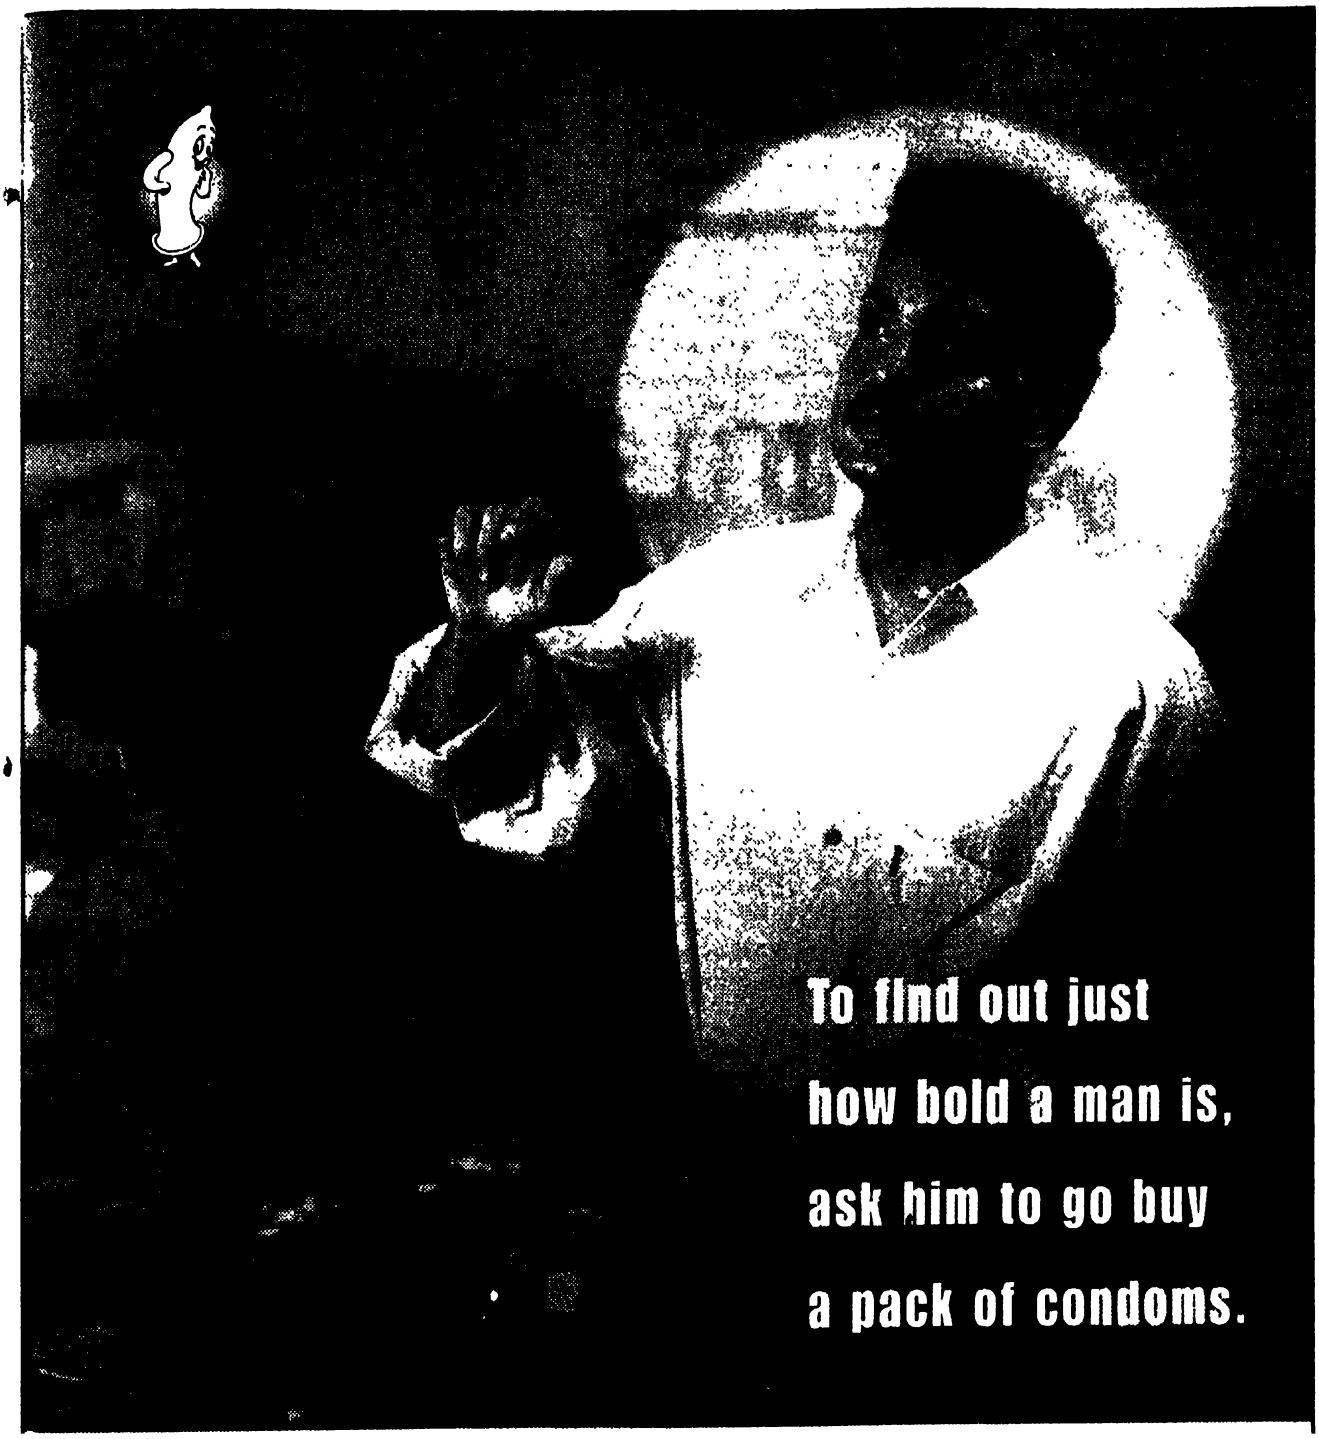
Tamil Nadu is considered a model largely because of the efforts of some non-governmental organisations (NGOs) that have spearheaded the fight against AIDS. Initially, they worked on their own; later they tried to mobilise government support. In 1992, the Tamil Nadu government launched a massive drive against the scourge, with funds from the World Health Organisation (WHO).

K. PICHUMANI

The programme in Tamil Nadu owes its success to five factors: the strong NGO movement, the government's commitment, the support provided by religious organisations, the unstinted support given by professional institutions such as the Indian Medical Association and by paramedical and nurses associations, and media support.

Tamil Nadu acknowledged the presence of the problem fairly early and forged a collaboration of various groups. This heightened awareness among the high-risk groups and the general public. Over 90 per cent of the population in Tamil Nadu seems to be aware of the problem.

There was, however, a gap between awareness and behavioural change. It was only in 1996, following consistent efforts by the government and the NGOs, that awareness translated into behavioural changes such as adoption of safety measures.



▶ *How do you assess behavioural change?*

Through Behavioural Surveillance Surveys (BSS) conducted by APAC. Such surveys study the people's behaviour in terms of their non-regular sexual relationships and safety measures such as condom use during such non-regular sexual practices. APAC has conducted such surveys continuously on the same set of people since 1996.

▶ *What behavioural changes have been noticed?*

For example, one of the target groups in this project is long-distance truck drivers. Eleven NGOs are working on a project called "Prevention along the Highway". Between 1996 and 1998, non-regular sexual behaviour, that is, incidence of sexual relationships with persons other than their spouses, reduced from 48 per cent to 32 per cent and condom use among the 32 per cent of the truck drivers increased from 47 per cent to 66 per cent.

Surveys among commercial sex workers show that they have started buying condoms in shops, in addition to what is distributed: this indicates their acceptance of safety measures. The number of sex workers who buy condoms has gone up from 9 per cent in 1996 to 16.5 per cent in 1998. Similarly, sales of commercially market-

There are still a few men who find it challenging to go out and buy a condom.

Why should you be embarrassed about buying or using a condom? Today millions of men have understood the protective value of the condom and ask for it as freely as they would for shampoo or a soap.

A condom is the best protection you and your partner have against unwanted pregnancies and sexually transmitted diseases including AIDS. Today a condom is also a terrific accessory for lovemaking. And it is the best way to show your partner that you really love and care.

Be a socially responsible citizen. The next time you need a condom, ask for it. Without embarrassment. Always use a condom.

AIDS Prevention And Control Project,
Voluntary Health Services

ed condoms, as opposed to subsidised condoms and those that are given away for free, increased from nine million pieces in 1994 to 29 million in 1998. These figures are higher than in any other State. People are now aware and are motivated to use condoms.

It took seven years for such a rate of behavioural change to occur in Uganda and five years in Thailand.

Psycho-social support to HIV-positive people is important. Usually, from the detection of HIV infection to its becoming a full-blown AIDS case, it takes three to 10 years.

▶ *What are the programmes in Tamil Nadu and which agencies are involved?*

In Tamil Nadu, the two major partners are the Tamil Nadu State AIDS Control Society (TNSACS), with K. Allaudin as its Director, and APAC, based at the Voluntary Health Services Hospital. The State Health Secretary provides support to both agencies. Both complement each other's work and avoid duplication.

APAC-VHS' role is confined largely to the prevention of transmission of HIV/AIDS through the sexual mode. It concentrates on prevention and control of sexually transmitted diseases (STDs), promotion of condom use; HIV/AIDS-related research activities, and educational programmes to stimulate behavioural change in the community. It does this with the help of 46 NGOs in the State and provides them technical guidance and financial support.

The TNSACS concentrates on blood safety in government and private sector blood banks; it supports government medical institutions in STD care and supports and cares for persons who test HIV-positive. It also conducts educational programmes.

▶. *What is the nature of APAC-VHS' collaboration with NGOs?*

APAC-VHS supports NGOs and the private sector. Its approach is thematic: it encourages NGOs to work with the target or high-risk groups such as the people in the urban backward area settlements (slums), highway truck drivers, commercial sex workers, and people in pilgrim and tourist towns. Since February 1995, APAC-VHS has given 46 grants to NGOs in Tamil Nadu.

▶ *How does APAC-VHS monitor the work of the NGOs?*

Its monitoring system is acknowledged as one of the best by NACO and the TNSACS, which now follow some of APAC-VHS' innovative approaches.

In addition to providing funds to NGOs, APAC-VHS offers technical support. It trains coordinators, counsellors and social and health workers to counsel patients; markets condoms socially, that is, sells them at subsidised rates; desensitises the NGOs' staff in dealing with sexuality issues; provides support to render services to target communities; and helps develop field workers' communication skills.

The goal of the USAID project, which ends in January 2002, is to sustain the work by developing about 100 NGOs as model groups that can continue the work until the scourge is controlled.

▶ *How does APAC-VHS collaborate with the private sector?*

In many ways. For instance, we have collaborated with JK Ansel Ltd (manufacturers of condoms) to market their product aggressively. We carry on advertisement campaigns to help condom buyers overcome their inhibitions about buying the product; make condoms available in non-traditional outlets such as grocery shops; tie up with the National Institute of Sales to train retailers to promote condom sales, as a social responsibility; and tie up with the Centre for Entrepreneurship Development to train NGOs in condom marketing. All these activities have increased condom use in Tamil Nadu among the high-risk groups and the general public.

▶ *What major research activities have been undertaken in Tamil Nadu?*

APAC-VHS has undertaken pioneering research work on the prevalence of STD in the 15-45 age group. Incidence of STDs in Tamil Nadu is high: 9.8 per cent of the adult population has at least one disease. If HIV and hepatitis-B are also included, the percentage is 15.8. In terms of absolute numbers, 3.9 million people suffer from at least one STD: this is a large number by any account.

The Behavioural Surveillance Surveys constitute the first such effort in India. Behavioural changes are the first observable parameters in targeted interventions. Such surveys, which provides valuable data on the changing behaviour of people, are conducted every year for the target groups by APAC.

The TNSACS has undertaken a Sero-Sentinel Surveillance as part of NACO's national agenda. The data collected from this survey are used only for research purposes: the identity of those surveyed is not made public. This research has been done continuously from 1993 in Tamil Nadu, the only State to have completed several rounds. This survey shows that the percentage of HIV-positive people among STD patients increased from 4.2 in 1993 to 16.27 in 1999; it now appears to be plateauing, which is a good sign.

But the positivity of HIV among pregnant women is likely to increase. While this figure was insignificant in 1994, it was 0.69 per cent in 1997 and is 1.67 per cent now. This is expected to increase for another two or three years. Generally, there will first be a plateauing in the high-risk group and then among the general population.

▶ *Why is the study of STD incidence important in dealing with HIV/AIDS?*

Because STD is a co-factor for HIV. People with STDs are 10 times more vulnerable to HIV than others. The second physiological reason is that people who suffer from STDs have ulcers in, or discharges from, the genitalia, through which the virus can get transmitted. Also, if a person has an ulcer or a sore in the genitalia owing to STD, that will be the entry point for HIV. Therefore, STD prevention is crucial to controlling HIV.

▶ *What is the latest in the treatment of HIV/AIDS?*

The treatment of HIV-positive pregnant women. Vertical transmission from the mother to the child is normally 30 per cent. With AZT (Zindovidin), the probability of transmission is reduced substantially; with treatment the child can be infection-free. The cost is also not very high.

▶ *How does providing psycho-social support to HIV-positive patients help?*

Psycho-social support to HIV-positive people is important. Usually, from the detection of HIV infection to its becoming a full-blown AIDS case, it takes three to 10 years. In India, the joint family system is a great help in providing care for such patients.

▶. *Is there no known cure for HIV?*

None till date. There are a lot of claims by Siddha and Ayurveda practitioners, but scientific proof is needed. In many cases, quacks exploit the emotional distress of HIV-positive patients and their families. Scientific research should be allowed to find out if a cure is available in the alternative systems of medicine. If such claims are proved scientifically, India would be in the forefront of HIV cure. ■

India's most sensational SEX accessory is a new condom

Dotted for extra pleasure

Normal condom

The lack of texture on the condom makes its usage purely functional.

New Moods Supreme

These dots bulge on the condom to excite the sensitive zones, and make the act of love even more passionate.

DOTTED CONDOMS

of safe sex practices. For instance, 95 per cent of the target population is aware of the two most common modes of transmission of STDs and HIV; among the target group, there has been a drop in the incidence of sex with non-regular sex partners; condom sales have risen from 17 million to 32 million pieces in the last three years, and the number of condom outlets has increased from 24,000 to 36,000 in the last two years.

ONE of the challenges that India faces is the care of the large number of HIV-infected persons. The lack of clinical, psycho-social and family-based support results in emotional distress and an increase in "opportunistic infections". According to APAC Project Director Dr. P. Krishnamurthy, home care is the best way to deal with HIV-infected persons as it not only helps them emotionally and physically but also reduces the public health care burden.

In fact, the Fifth International Congress on AIDS in Asia and the Pacific (ICAA), which concluded in Kuala Lumpur recently, stressed the importance of psycho-social support for the HIV/AIDS-affected and their families. According to Dr. Gordon Alexander, Senior Country Programme Advisor, UNAIDS, the epidemic has been getting out of control in Asian countries but the political response has been patchy. The conference also emphasised the need to see the HIV/AIDS problem beyond a narrow health perspective.

Dr. Suniti Solomon, director of YRG CARE, agrees. "Confining the scourge to the tertiary sector is not enough. There is a need to channel efforts to improve the quality of life for the HIV/AIDS-infected. This calls for a holistic approach without concentrating on just the clinical aspects." Such an approach should address other factors, such as the social stigma attached to HIV and AIDs and the fact that the legal provisions in respect of the fundamental rights of HIV-infected persons are somewhat nebulous.

The experience of public health professionals the world over demonstrates that coercive strategies, such as mandatory testing, breach of confidentiality and discrimination against the HIV/AIDS-affected, only serve to drive the epidemic underground and thereby increase the risk of new infections. There is, thus, a need for an open debate with a strong political response to combat the deadly scourge. ■

A pioneering service

The Community Health Education Society in Chennai offers medical help for HIV-positive children, reaches out to the community to identify and treat others who are affected, and works to create awareness about the disease.

ASHA KRISHNAKUMAR

LIFE dealt a cruel double-blow to Meghala, 11, and Manoj, 9, within a few years of their birth. They were orphaned seven years ago; a little over a year later the two, who were admitted to the Institute of Child Health (ICH), Chennai, with severe diarrhoea, were found to be HIV-positive. Even as their condition deteriorated, Meghala and Manoj were turned out of the ICH for fear that the infection would spread to others. The orphanage they had been staying refused to take them back.

At that point, Dr. P. Manorama, a paediatric gastroenterologist at the ICH, treated and nursed them and adopted them. The orphans found a home and a caring mother. As news of Manorama's gesture spread, a number of HIV-positive patients, who had been refused medical aid elsewhere, came to her; many more were referred to her. To take care of the increasing number of HIV/AIDS-affected patients, Manorama founded the Community Health Education Society (CHES).

Dr. P. Manorama, founder of the Community Health Education Society in Chennai.

There are a number of organisations that work with HIV-positive persons in Tamil Nadu, but the CHES is one of the few that do pioneering work not only in taking care of HIV-positive children but in reaching out to identify and treat the affected. It also helps create awareness about the disease.

Set up with 11 volunteers, the CHES now has over 200 volunteers, 34 full-time members on its staff and 30 peer educators (who track and identify HIV-positive persons). In the last five years, it treated 330 HIV-positive adults and 60 AIDS patients. There have been referrals from all over the State and from Kerala, Andhra Pradesh and Karnataka, and even from Mumbai and Calcutta. Until now, the CHES has treated 96 children (of whom 12 died). It also runs an ashram, a home for HIV-positive children who have been abandoned by HIV-positive parents or commercial sex workers; where possible, children are sent back to their families after counselling. There are 20 children at the ashram; there is also a school for HIV-positive children who have been denied admission in regular schools.

The CHES' annual budget of Rs.30 lakhs is met by contributions from the Tamil Nadu Government, the United States Agency for International Development (through the AIDS Prevention and Control Project at the Voluntary Health Services Hospital), some private institutions and others.

The CHES runs several projects:

Home care for HIV-positive persons: This is a pioneering project in which trained field workers, who are in many

A few minutes of pleasure without protection and you could become the target of STD.

Here are a few symptoms that you might notice in your genital area if you are affected by STD.

- Genital ulcers or sores
- Urethral discharge
- Profuse vaginal discharge
- Burning sensation while urinating.

If you experience any of these or if you've had unprotected sex visit your doctor immediately. Take your sexual partner along with you too. Early treatment can easily and completely cure STD. Failure to take treatment could result in abortions, still births, sterility, continuous pain in the lower abdomen, in women. Besides it also increases your chance of being affected by AIDS.

Remember:

- Immediate treatment can cure you of STD.
- Never have unprotected sex. For safe sex always use a condom.

AIDS Prevention And Control Project

Good health needs good genital hygiene

cases themselves HIV-positive people, visit affected people's homes, offer preliminary medical care and provide physical and psycho-social support to the family. This project is supported by the Tamil Nadu State AIDS Control Society (TNSACS) Over 250 people have been treated under this project since it was started in 1997 According to Dr. Manorama, the field staff are taken seriously because most of them are HIV-positive women, and this has contributed to the success of the project.

S. THANTHONI

At the CHES-run school for HIV-positive children, some of whom had been denied admission in regular schools.

Counselling at the Government Hospital of Thoracic Medicine (TB sanatorium): Tuberculosis is a co-factor of AIDS, and patients at the TB sanatorium at Tambaram, on the outskirts of Chennai, which has treated over 500 HIV-positive patients, need counselling. In the past 10 months, four CHES counsellors working at the sanatorium have counselled about 2,500 patients. This project too is supported by the TNSACS.

Working with commercial sex workers: This project, with support from the TNSACS, educates women involved in the sex trade in Chennai about the disease and its consequences.

Rehabilitating commercial sex workers: Under this project, which is funded by USAID through APAC-VHS and is run in 10 areas in Tamil Nadu, field workers educate commercial sex workers about AIDS, promote the use of condoms, and teach them "negotiating skills" to persuade clients to use condoms. Through this project, the CHES reaches out to over 1,000 women in brothels identified by "peer educators" who are pimps and/or HIV-positive persons. In the past one year, the CHES distributed over three lakh condoms, raising the percentage of condom users in these brothels from seven to 63. The CHES also rehabilitates sex workers by finding them alternative employment and taking care of them in the interim period. It also counsels and provides STD referrals to sex workers.

Intervention project for "the third gender" (or *hijdas* or eunuchs): The CHES took up this project on its own without funding, realising the need to work with the so-called "third gender", who are another high-risk group. Under this project, the CHES organises a programme to spread awareness about AIDS, at Koovakam (near Villupuram in South Arcot district), where eunuchs congregate annually for two days, first to take their customary marriage vows to their deity, Avaran, and later to go through the rites of widowhood.

Apart from these projects, the CHES has an institutional care facility and a free hospital for terminally ill HIV-positive people. The CHES has also set up a referral centre for sexually transmitted diseases that go in tandem with HIV/AIDS. Eight out-reach workers refer STD patients to the hospital and undertake social marketing of condoms.

The CHES also helps spread awareness about AIDS by conducting cultural programmes for target groups in slums, prisoners in jails, and visitors to tourist and pilgrim towns.

The CHES' programmes are periodically reviewed and modified. Administrative officer P. Muthupandian says: "Sexual contact is perhaps the main cause of the spread of the disease. Men get HIV usually from sex workers, and women from their husbands." Meenakshi, 37, Sudha, 32, and Valli, 31, and a dozen other CHES field workers were infected by their husbands. Valli was married only 15 days, after which she was forced out of the house; but by then she had already been infected. Sukanya, 34, who is terminally ill at the CHES hospital, was infected by her husband who died of AIDS three years ago.

Awareness about the disease is still poor, even among medical professionals. According to Muthupandian, Kumar, 28, was found to be HIV-positive in a Chennai hospital four months ago. Thereupon doctors and nurses allegedly refused to treat him; he was locked in a room for four days and then sent away.

According to Dr. Manorama, misconceptions about AIDS give rise to a lot of practical problems. For instance, the CHES is unable to rent a place to house the children since many people fear that the disease spreads through casual physical contact.

Dr. Manorama says that the spread of the disease can be curbed to a large extent if sex workers used condoms. Reema, 24, an ashram inmate who was rescued from a Mumbai brothel, has a harrowing tale to narrate. Sold many times over after her marriage in Hyderabad, Reema landed up in a Mumbai brothel where she was administered intravenous drugs twice a day in order to be able to entertain six or seven clients each day. Rescued last year by the former Assistant Commissioner of the Brihanmumbai Municipal Corporation, G.R. Khairnar, she was sent to the CHES. Her experience has left her psychologically traumatised: she now suffers from a fear psychosis and is mostly in an agitated state.

Vishwa, 31, now a field worker with the CHES, was involved in the trafficking of women until 1996 when he became a peer educator and helped identify brothels. He had initiated a number of girls into commercial sex: he then decided to work for their rehabilitation and joined the CHES for a compensation of Rs.1,500 a month; in his earlier profession he used to make as much money each day. He also married a former sex worker.

Not all children born of an infected mother become HIV-positive. For instance, Rama, 35, who contracted the infection from her truck-driver husband (who is now terminally ill at the CHES hospital), has two daughters, only one of whom is infected. Says Dr. Manorama: "The real problem now is the care of children who are HIV-negative. What will they do after their family members die? They will have to live with the stigma."

In its mission to provide medical assistance to those who have been denied it and to raise awareness about HIV/AIDS, the CHES networks with organisations working in the same sphere, including the YRG Care Centre for AIDS Research and Education, the TTK De-addiction Centre, APAC-VHS and the TNSACS. ■

A child survival tool

The BCG vaccine is still efficacious in protecting children against some serious forms of tuberculosis, though it affords no such protection to adults.

R. RAMACHANDRAN
in New Delhi

A CONTROVERSY over the use of the BCG (bacillus calmette-guerin) vaccine in the prevention and control of tuberculosis (TB) was recently set off by a newspaper report that questioned the usefulness of the entire BCG immunisation programme for children and called it "the Great BCG Hoax". Since the administration of the vaccine forms part of the expanded programme of immunisation (EPI) of children in the country, such a controversy could harm the programme by creating doubts in the minds of parents about the efficacy of BCG vaccination.

The news item was based on a report of the 15-year follow-up trials conducted by the Tuberculosis Research Centre (TRC), an institution in Chennai under the Indian Council of Medical Research (ICMR), in Chingleput district of Tamil Nadu, not far from Chennai. The trials were conducted in order to evaluate the efficacy of the BCG vaccine as a public health measure in preventing pulmonary TB. The TRC study, a well-managed large-scale, double-blind randomised trial, concluded that the vaccine provided no protection at all in adults but a low level of overall protection in children against pulmonary TB.

The results were published in the August 1999 issue of the *Indian Journal of Medical Research*, an ICMR journal. The findings confirmed the results at the end of the first phase of the trials in 1979 (it lasted seven and a half years), which had been published in the same journal in July 1980, as well as the results of other studies. The Chingleput trials were designed to study the vaccine's efficacy against only the pulmonary form of TB.

Mycobacterium tuberculosis, the tubercle bacillus, belongs to the family of organisms called mycobacteria and is the deadliest pathogen in the group afflicting humans. In recent times, it has had a resurgence in association with Acquired Immune Deficiency Syndrome (AIDS). The similar *M. leprae* causes leprosy. TB in humans occurs in different forms and can affect almost every system. The most common form is pulmonary TB. Extrapulmonary forms such as meningitis and skeletal, abdominal or genital TB are relatively uncommon. When TB occurs in more than one system simultaneously, it is termed disseminated TB, and miliary TB is the most extreme such form. (When it was discovered, the X-ray image of the lungs of the affected persons showed millet shaped shadows; hence the name.) In children, however, these forms are more common, and some of them, like tuberculous meningitis and miliary TB, show high mortality rates.

There is only one vaccine against all mycobacterial diseases – the BCG. It is a derived from the attenuated bovine tubercle bacillus called *M. bovis*. The vaccine was first used against human tuberculosis in 1921. The protective effect of the BCG vaccine against TB has been well demonstrated in animal systems, but a number of controlled trials conducted since the 1930s have produced conflicting results with regard to its protective efficacy against TB in humans (see Figure, which includes results of Phase I of the Chingleput trials). Its efficacy (against pulmonary TB) has been found to vary from zero to 80 per cent! (In Brazilian trials on TB meningitis, the efficacy is nearly 90 per cent.) From a medical point of view this is baffling, and in the face of the divergent results, it has not been possible to quantify, or even identify, the factors that govern the level of protection needed.

The variation has been debated over the last four decades, but there is as yet no consensus on the possible causes. One explanation attributes it to differences among the various strains. Another explanation is that the differences reflect the prevalence of infections with "environmental" mycobacteria. Numerous species of mycobacteria are found in water and soil, for example, and many human populations are sensitised to these. This is particularly true of India. Animal-based studies have shown that infections with some of these species can confer a certain degree of protection against TB, as can BCG. Therefore, in populations where there is natural infection with "environmental" and "atypical" mycobacteria (such as *M. avium*), or natural immunity derived from exposure load to *M. tuberculosis* itself, it can mask the effect of BCG.

Another view is that different immunological mechanisms act against different stages of mycobacterial infection and disease, and that BCG is more effective in stopping bacterial dissemination in blood, than in containing the growth in specific parts of the body. This view seems consistent with the finding that BCG generally provides a high level of protection against tuberculous meningitis even in trials in which the vaccine offered little protection against other forms of TB. Yet another explanation for BCG's inconsistent behaviour is geographic variations in the TB bacilli. In the context of the Chingleput trials, it has been pointed out that the common South Indian strain of *M. tuberculosis* is less virulent than other strains. Perhaps several factors, biological and environmental, have conspired to varying levels in the contexts of different trials, resulting in the wide variations noted.

EVEN though the use of the BCG vaccine as a public health measure in checking the pulmonary form of TB has thus been controversial for long, there is conclusive evidence from studies around the world, including India, that it is very effective in preventing childhood forms of TB. It is for this reason that the World Health Organisation (WHO) has recommended its continued use in immunisation programmes in TB-endemic areas. And it is for the same reason that, based on the recommendations of the ICMR, the vaccine has been retained in the EPI to immunise children under one year of age in India where TB remains widely endemic and a major cause of death.

The strategy of routine childhood vaccination has been adopted in most other nations (with the notable exceptions of the Netherlands and the United States). In fact, it is the world's most extensively used vaccine. Because of the controversy over its efficacy, it also has been the most studied one. The news report in question reflected an improper understanding of the TRC trials and their outcome. It missed the fact that there are other severe forms of TB that affect children, against which the BCG vaccine

is been demonstrated to be effective. The RC study was not designed to evaluate the ficacy of the vaccine against these extra-ulmonary forms of TB, however.

The Chingleput trials were started in y 1968 and the vaccine/placebo intake ase was completed in March 1971. The 5-year follow-up of the effect of the vac-ine on the study population was com-leted in 1987. (It is, however, not clear why it took 12 years for the results to be published.) A study conducted during 1950-55 on the rural population of Madanapalle in Andhra Pradesh had shown that BCG could only protect to the level of 31 per cent. In 1963, the Government of India felt that a reliable estimate of the efficacy of BCG as a pub-ic health measure should be obtained. This was the rationale for the Chingleput rials. The study was expected to provide a conclusive answer with regard to the pro-ective efficacy of BCG, especially in the ight of the Madanapalle findings and the onflicting results of earlier trials.

SINCE their isolation between 1908 and 1918 at the Pasteur Institute in rance, BCG organisms have been main-ained in several laboratories around the vorld. It has never been cloned but sever-l strains of BCG are used in the manu-acture of the vaccine, the most potent nes being the Paris and the Copenhagen strains. The vaccine is cheap and stable and comes in the form of freeze-dried powder which is reconstituted in injectible liquid form before use. The vaccine used in the Indian EPI is based on the Copenhagen strain. The Chingleput trials, however, used both the strains among the study population so that any intrinsic strain-dependent disparity in the protective efficacy of the vaccine does not affect the results. The strains were evaluated against placebo control, and within each strain two doses (high and low) were used.

The study population included a largely rural community with some semi-urban people as well. The trial area covered 209 panchayats and nine town blocks. The entire resident population 3,66,625 (except children under one month of age) was included. Of this, 281,161 persons were vaccinated with BCG or placebo by random allocation in such a manner that the two strains were administered to one-third of the population each and the placebo to the remaining one-third. The study area is characterised by high infection rates in children and high disease rates among the middle aged and the old. The trial was organised by the ICMR, in cooperation with the WHO and the Centre for Disease Control (CDC), U.S., during the first phase and subsequently by the ICMR by itself.

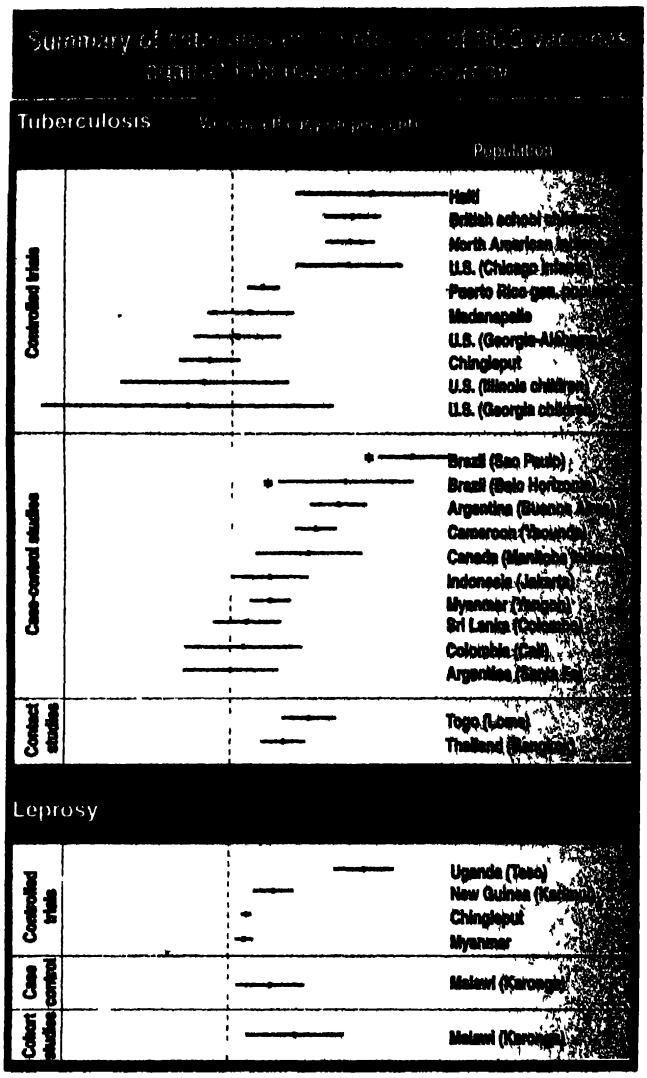
At the end of seven and a half years, the preliminary results showed that BCG did not protect against pulmonary TB. When the results of Phase I were published, several reasons, including possible methodological flaws, were postulated for the lack of protection. The follow-up period was extended to 15 years chiefly in order to test these hypotheses and settle the issue. Among the 109,873 persons classified as "uninfected" at intake phase, 560 TB cases had arisen over the 15-year period. The number of cases from the high-dose, low-dose and placebo groups were 189, 191 and 180 respectively. The similar rates in the three groups indicate lack of efficacy, confirming the results at the end of seven and a half years. The study has also ruled out the various other hypothesised reasons for the null result.

The design of the trials was to "test the efficacy of BCG as a public health measure; that is, in cutting down transmission of TB". The disease is spread by prolonged contact with an infected individual through airborne droplets from sputum. Accordingly, the TB cases in the study were identified by means of the demonstration of the TB bacilli by sputum smear analysis as well as culture. This kind of bacteriology, however, does not detect all forms of TB, particularly extra-pulmonary forms or childhood forms, for persons with such forms do not excrete bacilli as those with the pulmonary form do. But from the perspective of limiting transmission, it is enough to look at forms that excrete bacilli through sputum and this is rare among children. Indeed, more than 95 per cent of the TB cases in children are usually smear negative. Thus, owing to the nature of the design of identifying TB cases, the Chingleput trials did not investigate the impact of BCG vaccination on childhood forms of TB.

However, from the limited sample of children in the trial population, the study examined the data by age group to estimate the possible protection offered by BCG against pulmonary TB in children. In children aged one month to nine years, it found a moderate protective efficacy of 27 per cent and 21 per cent with high and low doses of BCG respectively. However, the report pointed out that these levels of protection were not statistically significant. Also, even if BCG does confer protection, it is limited in time, and the vast majority of newly developed smear positive cases of pulmonary TB among the general population cannot be prevented by mass BCG vaccination, particularly in the developing countries, where a substantial number of the TB cases is caused through

N BALAJI

uberculosis patients in a government hospital in Chennai. BCG vaccination confers high level of protection against childhood forms of TB, and provides additional rotection against leprosy in endemic areas, although it is a different story when it omes to its efficacy in an adult.



re-infection or reactivation.

Given this fact, the report makes this pertinent observation: "The public health value of BCG can only be in preventing childhood mortality caused by disease resulting from haemotogenous spread (through blood)". It has thus reiterated the WHO/ICMR rationale for recommending continued use of BCG in EPI, the objective of which is to protect children from serious forms of TB and ensure childhood survival. Indeed, based on the data of Phase I itself, the immunisation policy of the Government of India had changed. Earlier, everybody below the age of 20 years was vaccinated with BCG. After the Chingleput trials since 1979, only infants below one year of age are vaccinated under the EPI. According to the ICMR, inclusion of BCG in EPI (whose coverage today is over 90 per cent) has proved beneficial as evidenced by the low incidence of TB meningitis and miliary TB in children in recent years.

"BCG protects children against serious forms of TB. BCG does not protect adults," emphasises Dr Thomas R. Frieden of the WHO in New Delhi. He adds: "What protects adults is the stopping of TB at the source and that is done by treatment with multi-drug therapy based on the DOTS (direct observation short course) strategy of the WHO. In the case of TB, the clinical programme is a public health measure and treatment is prevention. BCG is a child survival tool whereas DOTS is a TB control tool." (In the context of HIV/AIDS, Dr. Frieden points out that children who are simply infected with HIV (to be mere carriers of infection) can be given BCG safely. However, children who have symptoms of AIDS should not be administered the vaccine because it may lead to complications.)

Since the Chingleput trials did include children, it is unclear why the efficacy of BCG against childhood forms of TB was not simultaneously investigated. Since these forms do not excrete bacilli, diagnosis is difficult. For example, TB meningitis would require extraction of spinal fluid for analysis and this procedure cannot obviously be carried out on a large scale. The incidence of these forms is low and, for a sufficient sample size, a huge population would be required to conduct randomised trials, and also the trials will be expensive, points out Dr. S. P. Tripathy, former Director-General of the ICMR, who was closely associated with the Chingleput trials. "While it may be difficult to do such a study today, nobody is prepared to take the risk. The BCG vaccine itself is inexpensive. So why drop it?" he asks.

But there are several case-control studies now available which have demonstrated that BCG confers consistently a high level of protection against childhood forms of TB. The results of the Brazilian trials on meningeal TB are a case in point. The protective efficacy found in other studies has ranged from 52 per cent to 84 per cent. The better done the study, the higher the evidence of efficacy, points out Dr. Frieden.

Note Estimates are based on data from randomised controlled trials, case-control studies, and household-contact studies Efficacy is expressed on a logarithmic scale, with bars indicating 95 per cent confidence intervals The two case-control studies in Brazil, indicated by asterisks, were on tuberculosis meningitis

A case-control study carried out at the Kalawati Saran Children Hospital, New Delhi with 37 cases and 74 controls found the efficacy of BCG in preventing TB meningitis to be 84 per cent. A similar study at the Government Medical College, Nagpur, with 92 cases and 92 controls in the 0-12 age group, found the efficacy to be 86.54 per cent. Here the efficacy was greater in the 0-6 age group than in the 7-12 age group. A study carried out at the Institute of Child Health and Hospital for Children, Chennai, during 1990-1992 found the protective efficacy of BCG against TB meningitis in children in the 0-12 age group children to be 77 per cent. A British study factored out the meningeal and miliary TB cases from the results of randomised controlled trials and case-control trials on the effectiveness of BCG against all forms of TB. It found the efficacy against meningeal/miliary forms to be 86 per cent in randomised controlled studies and 75 per cent in case-control studies.

There is also a fringe benefit from BCG vaccination which is particularly relevant in the Indian context. The Chingleput area is also endemic to leprosy. The first phase of the TRC trials also looked at the protection that the BCG vaccine conferred against leprosy and found its efficacy to be about 30 per cent. Evidence that the BCG vaccine may provide a higher level of protection against leprosy than against TB also comes from a 1979-89 study in the African country of Malawi, which found 50 per cent protection whereas there was no significant protection against pulmonary TB.

Even though the BCG vaccine is a less than ideal vaccine for the purpose because of the unpredictable nature of its protective efficacy in TB or in preventing transmission, the fact that it is very effective against childhood forms of TB in most populations and that it provides additional protection against leprosy in endemic areas makes it a useful prophylactic tool in countries where the diseases are prevalent. Above all, it is inexpensive, safe and stable. Nothing much is lost in continuing its use in EPI. So why complain?

Setback to 'social engineering'?

Vajpayee's axing of Kalyan Singh as U.P. Chief Minister has weakened the strategy of relating Hindutva to OBC politics. This could spell big trouble for the BJP.

BEYOND THE OBVIOUS

PRAFUL BIDWAI

IT is a truism that Kalyan Singh did not really resign as Uttar Pradesh Chief Minister, although as a technicality, that is correct. He was unceremoniously sacked by Atal Behari Vajpayee – more out of personal pique than on the basis of a serious political calculation regarding the BJP's future. The axing of Kalyan Singh and the weeding out of some of his supporters from key positions in U.P. mark a new phase in the evolution of the BJP, in particular of factionalism at the topmost level of the party, and its relationship with different social classes, especially the other backward classes (OBCs), that vocal group of middle castes which continues to be assertive, particularly in the Hindi belt.

It is, of course, undeniable that Kalyan Singh campaigned against some BJP candidates in the latest elections, and worked more or less openly in some cases in favour of the Samajwadi Party through leaders such as Sakshi Maharaj. But that is not why he was removed. Other senior leaders such as Kalraj Mishra or Lalji Tandon, and even U.P. party president Rajnath Singh, have committed similar acts of subversion without incurring the wrath of the party's top bosses. Nor is it possible to attribute the BJP's poor performance in the State mainly to Kalyan Singh's sabotage. The party's base in U.P. has considerably eroded, its vote share having fallen by nearly 10 per cent – thanks to processes that are largely independent of Kalyan Singh, including restlessness among the OBCs, greater self-confidence amongst Muslims and the revival of the Congress(I).

Kalyan Singh was singled out because Vajpayee has a particular aversion to him, and believes that the Chief Minister worked clandestinely for his defeat in Lucknow. Personal pique apart, Vajpayee is allergic to Kalyan Singh's aggressive OBC politics. He has long been uncomfortable with the "social engineering" approach advocated by the likes of K.N. Govindacharya, and to an extent, L.K. Advani, which tries to co-opt OBC self-assertion into the broader Hindutva framework. Vajpayee certainly disapproves of the idea of banking on Hindutva's aggressive forays into OBC identity politics as the key to the BJP's growth.

Vajpayee went out of his way to remove Kalyan Singh altogether. He replaced him with Ram Prakash Gupta, a Bania leader less known for his political accomplishments than for his longstanding RSS connections and personal loyalty to Vajpayee. The composition of Gupta's Cabinet does not do much to reverse Kalyan Singh's marginalisation, although some of his old Ministers have been accommodated in it out of fear that the former Chief Minister might get even more rebellious if they are kept out. Gupta is reportedly planning to reverse a number of decisions made and orders issued by his predecessor, including more than 60 recent appointments – the most important among them being the nomination of Kusum Rai, considered his confidante, to the State Commission for women.

NONE of this would have merited serious attention if it were a phenomenon confined to U.P. and to "normal" factionalism which has become pervasive in what was once "the party with a difference" – disciplined, united, purposive, and dead-serious. As it happens, the U.P. drama is a "side-show" or surrogate battle being played out within the BJP's national-level leadership, especially between Vajpayee and Advani. Vajpayee has been personally, directly, involved in the events in U.P. that run from candidate selection three months ago, through Kalyan Singh's dramatic departure, to the selection of portfolios in the new Cabinet. Advani, for his part, has been equally serious in promoting, shielding and defending Kalyan Singh. What is being played out in U.P. is the Vajpayee-Advani conflict, in which Murli Manohar Joshi, a side-player, has sided with Vajpayee.

Vajpayee clearly has the upper hand in this power struggle. Earlier, he succeeded in marginalising Sushma Swaraj (and her husband Swaraj Kaushal, then engaged in secret talks with Naga rebels). Similarly, it was at Vajpayee's instance that the BJP allied with the Janata Dal in Karnataka – a decision that was not discussed at the National Executive. Vajpayee has also been playing his own game in the VHP, where Ashok Singhal (who is close to Advani) is being eclipsed by Giriraj Kishore, a Vajpayee groupie, who can hardly be called "liberal" or even a soft-Hindutva advocate. Now Vajpayee has turned his attention to India's most important State where he is relentlessly promoting factional loyalists, rejecting compromises. For instance, an agreement was struck between the Vajpayee and Advani factions just before Gupta's swearing-in that two BJP upper-caste faction leaders – Kalraj Mishra and Lalji Tandon – would be kept out of the Cabinet. As part of the deal, Advani had agreed to communicate this decision to the two leaders, and also to be present at Gupta's oath-taking. But this was cancelled just as Advani was about to board a plane for Lucknow – at the behest of the Prime Minister's Office (PMO). The Mishra-Tandon duo was duly sworn in.

ALL this calls for a reassessment of Vajpayee. Those who thought that he is soft, "liberal", above factionalism, or that he works by consensus, and has no raw ambitions related to crude power politics, must think again. Vajpayee's image, largely cultivated by a fawning media, is misleading. He is deeply mired in fac-

tional politics. He is as ruthless as anyone else. He deeply resents the fact that for long years he was sidelined in the party by Advani, who served two terms as president, terms which saw the party jump from two Lok Sabha seats to 89. Vajpayee is attached to the upper caste, in particular Brahmin, faction in U.P. and probably believes that the BJP's best bet lies in a Brahmin-Dalit alliance, which totally marginalises the OBCs. He is not averse to soiling his hands in venality and patronage, nor to the politics of personality cults. The PMO under him has been involved in numerous shady deals in the past 20 months.

Vajpayee apart, Kalyan Singh's removal from a pivotal position in the BJP power structure must be seen in relation to other OBC politics-related events, in particular Shankersinh Vaghela's alienation from the party in Gujarat, and Sahib Singh Verma's Jat lobby which was involved in faction-fighting in Delhi, which too led to his removal as Chief Minister. The party top brass is giving out the signal that it is not as committed as in the past to the Mandal-Kamandal alliance – despite the expansion of the OBC reservation list, in pursuit of pure expediency.

However, Vajpayee may be overplaying his hand in U.P. – just as he did in Karnataka, where allying with the utterly discredited J.H. Patel turned out to be a disaster for the BJP. This time around, the stakes are even higher. The BJP is in deep trouble in U.P., its fortress in recent years. In the latest Lok Sabha elections, of a total of 425, the party led in less than 120 Assembly segments. Its OBC base is shrinking. Kalyan Singh is a formidable opponent. He is gutsy and muscular, has political acumen, and pushes a hard line, even if that means brazenly violating the law. The Babri Masjid demolition, it bears recalling with awe and horror, could not have happened without him manipulating the government machinery to ensure the kar seva would take place on ember 6 safe from the attention of ntral forces.

SUBIR ROY

Kalyan Singh and Vinay Katiyar at the Hanuman Garhi temple in Ayodhya on November 9.

Kalyan Singh can create real trouble for the BJP, especially if Vajpayee continues to marginalise and humiliate him, and if his OBC core-supporters are kept out of access to power. This could well precipitate fresh Assembly elections, which the BJP cannot relish. The Rajya Sabha elections from U.P. too are less than four months away. The BJP needs every seat it can find to shore up its poor presence in that House. It cannot afford to have Kalyan Singh ranged against it.

YET another factor is the neighbouring State of Bihar. State party boss Sushil Modi was dead against removing Kalyan Singh because of the likely damage to the BJP in that State, where too it has to compete with the Rashtriya Janata Dal (RJD) for OBC support.

Kalyan Singh has for the moment chosen to move Rightwards by adopting a hardcore Hindutva line, as demonstrated by his visit to Ayodhya, his drumming up of the temple issue, and his statements ridiculing the Lahore summit. But he may only be reminding Vajpayee of his own importance in the Ayodhya factor and its contribution to the BJP's political advance during the period of 1986-92. At any rate, this does not mean that he will reject for all time to come the option of joining hands, openly or secretly, with non-BJP leaders and parties, including Mulayam Singh Yadav and Laloo Prasad Yadav (who has approached him). Kalyan Singh may well be so tempted. In U.P., an OBC alliance with substantial Muslim support, could form a formidable, potentially winning combination. Kalyan Singh's ability to mobilise peasant castes, like his own Lodh Rajputs, should not be underestimated. It is not the Mishras and the Tandons who built the BJP in U.P. They have no mass base whatsoever. It is above all the OBCs' entry into it, engineered by Kalyan Singh, that gave it ballast.

Kalyan Singh is not just another BJP politician. He is quintessentially an OBC leader. Indeed, he represents a unique confluence of two streams, Hindutva and OBC-based politics, Mandal and Kamandal. No other leader of stature has been able to embody this or co-opt OBC politics into the Hindutva framework, or half as confidently, the way Kalyan Singh has. He represents the greatest success of the "social engineering" strategy of accommodating plebeian groups into Hindutva's hegemonic project.

If Kalyan Singh is antagonised and pushed out of the BJP, that could spell a decisive setback for, if not the end of, "social engineering". Kalyan Singh is not only the BJP's ablest non-upper caste leader with a rural base, he is potentially a candidate for India's first Prime Minister shaped by OBC politics. Losing him will cost the BJP heavily in terms of its image and in terms of votes. It could well inaugurate its reduction to a largely urban, upper caste, elitist party that cannot communicate with the poor or the middle layers of society. Such a party could, of course, have a significant presence in Indian politics, but it could hardly hope to come to power on its own. Even less can it transform India radically and fundamentally the way the Hindutva project aspires to do. Without a sizable non-upper caste base, the BJP has only a dim future.

Bofors

This has reference to the Cover Story "Know your Bofors" (November 26). The ...ly legitimate concern of the Indian gov...nment in the Bofors affair could be ... whether it got the guns at the price it was ...repared to pay. What AB Bofors did with ...e millions that accrued to it through the deal with India should not have been the government's concern at all. Moreover, payment of commissions is a long-established and widely prevalent practice.

It was the parties and politicians opposed to Rajiv Gandhi who have tried to make much of his decision to go ahead with the Bofors gun deal in spite of the then Army chief's opinion that the contract should be cancelled if the company refused to furnish the names of the middlemen. The superb performance of the Bofors gun in the Kargil War proved that Rajiv Gandhi was right.

Cyclone havoc

"Killer cyclone" (November 26) gave a graphic account of the tremendous loss in terms of human lives, livestock and damage to infrastructure in Orissa. It will take years and thousands of crores of rupees to bring back normalcy to the devastated areas. The nation has responded to the disaster in a half-hearted measure, though. However, the relief materials and the money should reach the affected people. Politics should be kept out when the nation faces a tragedy of such magnitude.

The Orissa Government and the Centre should think of long-term measures to cope with cyclones.

Kannur violence

Political violence in Kannur district has a long history ("Blood and tears in Kannur", November 26). When the Praja Socialist Party (PSP) was formed in the 1950s under the leadership of P.R. Kurup, there were clashes between the workers of the PSP and the undivided Communist Party in the Panoor area of Thalassery taluk. Later, in the 1970s, the district witnessed clashes between CPI(M) and Congress workers. During the same period, the Rashtriya Swayamsevak Sangh and the Jan Sangh achieved some presence in the area. Although these organisations are not strong numerically, their cadres, who receive physical training, are active.

All political parties have to share the blame for the recent developments. Now each party is trying to bring the villages under its control. Some attempts are made to establish peace, but these are confined to top political leaders. Unless party leaders at lower levels are involved, the situation in the district will remain the same.

Auschwitz and Pokhran

I was surprised to read the concluding paragraphs of the article "Auschwitz, Pokhran and beyond" (November 19). I do not think that the Nazi killing fields, the use of the atom bomb on Japan and Pokhran-II are objects of comparison. The author does mention the difference between the first two, although he proceeds to ignore the difference later.

More disturbing is his claim that the people, the Government and the nuclear establishment in India are dehumanising the decision to go nuclear and the terrible consequences of doing so. We do happen to be surrounded by countries which do not value much the freedom of the people of India. Past events have shown that we cannot rely on the United Nations or the United States to defend our borders and our values. The author quotes Gandhi: "Will it restore to him (the poorest and the most helpless person) control over his life and destiny?" I think the nuclear test will help the poorest person pursue his dreams.

Bhaskar S. Manda
Received on e-mail

Rajaji

This has reference to the article "In the cause of peace" (November 19) by C.V. Narasimhan, former Under-Secretary-General of the United Nations. It made interesting reading, especially the reference to former Governor-General C. Rajagopalachari and his visit to the United States to meet President John F. Kennedy. Just after Rajaji met the President, reporters asked him whether the talk was fruitful. The reply was: "Well, I can't say as it is only the beginning of a long process and at the moment I can only say the talk was flowerful and it may take quite some time to bear fruit."

It would also be of interest to recall that in 1967, at the initiative of Narasimhan, the queen of Indian music, M.S. Subbulakshmi, gave a musical performance at the United Nations. She sang a beautiful and meaningful song composed by Rajaji.

R. Daniel Jayakumar
Nellikuppam, Tamil Nadu

George Fernandes

In the article "The meaning of George Fernandes" (November 5) the author seems to be too harsh on the Defence Minister. It is not unethical for anyone to harbour ambitions. Every writer or scientist wants to win the Nobel Prize, just as every politician dreams of becoming Prime Minister. By aligning his party with the Bharatiya Janata Party, the Samata Party leader served the cause of secularism. This is evident from the fact that the BJP has adopted the National Democratic Alliance's (NDA) manifesto in which there is no place for issues such as the Ram temple, abrogation of Article 370 of the Constitution and a common civil code. The extent of success achieved in this direction can be gauged by the fact that the Farooq Abdulla-led National Conference is now a partner in the Vajpayee Government.

George Fernandes' views on the threat from China were right but they could have been expressed in diplomatic language. George Fernandes is a great parliamentarian and an eloquent public speaker.

George Fernandes has been a doughty opponent of the Nehru-Gandhi dynasty's rule. He believes that dynasties and democracy do not go together. However, history will not condone George Fernandes for shifting his loyalty to Charan Singh immediately after defending Morarji Desai's government in the Lok Sabha in 1979.

Foreign funds

I do not normally respond to Praful Bidwai's tendentious articles. However, this time I shall, for he states that the "Hindutva campaign against 'foreign' funds would have sounded a little less biased and outrageous had the BJP, its cohorts and its government had consistent standards" ("Stifling dissent and debate", November 5). Is this not true for most, if not all, of his arguments? Additionally, since Lalita Ramdas ("Letters", November 5) and others call for a public debate as to what constitutes "political" action and

what is "social" action, let us have one.

The thrust of his "vitriolic attack" on the Government action of issuing notices under a "technical provision of some enactment like the FCRA" (laws are mere technical provisions!) is that it is an assault on democracy, the freedom of speech and so on. The action of the non-governmental organisations (NGOs)/civil society organisations (CSOs) was not "political" but "social" and in consonance with the fundamental duties prescribed under Article 51 (a) of the Constitution. Is not compliance with such a "technical provision", passed under the Constitution, part of the duties of Indian citizens? The courts should have been approached had there been any discrimination in the application of the laws of the land and/or if compliance with an enactment like the FCRA was in conflict with the provisions of the Constitution.

The article says that the funds (of CSOs/NGOs) are "earmarked for specific projects" and are "not easily divertible". It also says that these organisations are accountable to the "donors". Does it then mean that the funds for sponsoring these advertisements of *Communalism Combat* had been earmarked by their (foreign) donors? If "foreign funds" have not been used in the advertisement campaigns as claimed, it can very easily be proved since everything is accounted for. Thereafter, the only fact that would remain to be examined would be whether the campaigners were motivated by partisan concerns or social concerns.

Undoubtedly, the advertisements were one-sided. If the concerns were social, the advertisements should not have stopped at just highlighting the views of the Sangh Parivar on women. It should also have informed the general public about the views of the ulema on women (as mentioned in the book *The World of Fatwas – Shariah in Action*). And please let me know whether the instances highlighted in the book are not "factual" and if any rebuttal of this book exists. If the fight was for equality and non-discrimination, why should Muslim women be discriminated against wholly and solely in obtaining maintenance under the amended Criminal Procedure Code? Subsidising pilgrims of a particular religion with public money is surely not the way to practise secularism, especially when such facilities are not granted to other religious groups – be it Hindus or Christians, Sikhs or Jews. Here is one instance where the "fundamental right" of "non-discrimination" has been violated.

The taxman, Vishwa Bandhu Gupta, was not transferred by the BJP. Neither was the BJP in power when the funds allegedly flowed into the coffers of the Sangh Parivar. Why should the present Government be faulted for the inaction of its (secularist) predecessors?

While mentioning the 16-year financial inflows from VHP- America to India, Bidwai neglects to mention how much money the Church and Church-based organisations have received from the U.S. and other countries. In addition, one is left to guess as to just how much European Union contribution of 4 per cent to Church-based groups in India amounts to. Given the widespread "fame" (dare I say it, notoriety) achieved by the Sangh Parivar, I fail to understand why it is reasonable to assume that the E.U. will contribute, in a major way, to "non-Christian, especially Hindutva oriented, organisations". What exactly is the E.U.'s benefit? Is Bidwai also equating all non-Christian CSOs/NGOs with Hindutva-oriented organisations?

Outlook (February 22, 1999) published a list of top 25 recipients of foreign funds for the year 1996-97. Ten Christian organisations included in that list received as much as Rs.209 crores, if not more, in a single year. Assuming that the inflows to these 10 organisations have remained constant, they would have received at least Rs.3,344 crores in 16 years. Compare this figure with the figure quoted for the VHP (Rs.5,300 crores). The number of Christian organisations is many, many times more than just ten. An estimate puts the inflow of funds for the Church and Church-based organisations at Rs.2,000 crores annually. The point I wish to highlight is the quantum of inflow of funds and the power it generates (regardless of its use or abuse).

It will be appropriate to apply the same standards used against Hindutva to the deeds (and misdeeds) of certain non-Sangh Parivar groups which also arrogate to themselves the right to proscribe and prescribe as to what is permissible and impermissible under the aegis of secularism and democracy. It is also not amiss to oppose, with the same strength of heart and mind, non-Hindutva organisations that publish abusive, offensive and insulting tracts. This is important if one wishes to remain credible as well as impartial.

In my article on Robert Mundel ("Between Monetarism an Keynesianism", November 26), the fol lowing sentence appears: "Marcu Fleming is on the staff of th International Monetary Fund." This sen tence was not in my original article and I protest against its addition at the editing stage, especially because Marcus Fleming died in 1976.

Prabhat Patnaik

New Delhi

The author's original reference to one of Robert Mundell's striking results also being "arrived at by J. Marcus Fleming of the IMF staff" was mistakenly and unjustifiably rewritten on the Frontline desk as stated above. The error is regretted. – Editor, Frontline.

Victory margin

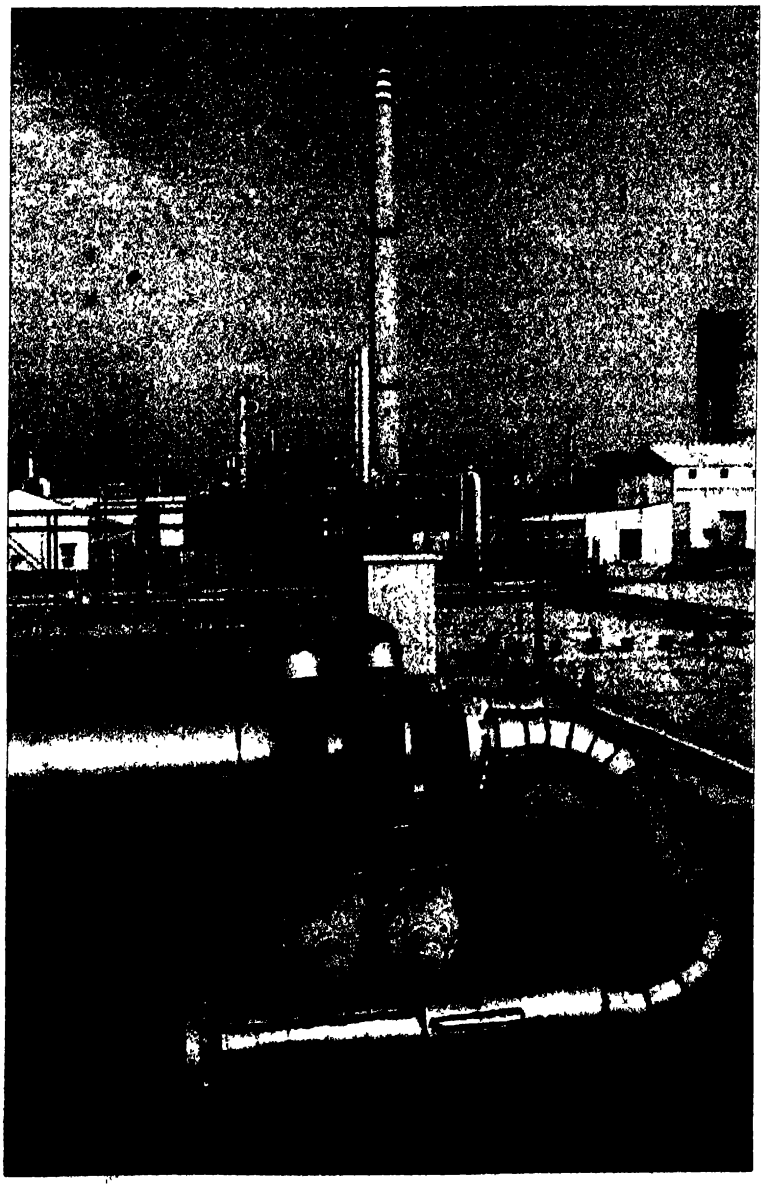
The article on the election verdict in West Bengal ("Patterns and pointers" November 5) mentioned that Mamata Banerjee's victory margin of 2.14 lakh votes in South Calcutta was the highest in the State. This is wrong. Nikhilananda Sor of the CPI(M) won by a margin of over three lakh votes from the Burdwan Lok Sabha constituency. His victory margin is actually the second highest in the country, next to Sonia Gandhi's in Amethi.

Also, the Trinamul Congress has not captured Serampur as reported; it only retained the seat.

Basab Basak

Burdwan, West Bengal

Correction: In "An unfinished story" (November 26) it is mentioned that according to an estimate of the People's of India project Hindus form 76.4 per cent, Muslims 12.6 per cent, Christians 7.3 per cent, tribal religionists 8.3 per cent, Jains 2.2 per cent, Buddhists 2 per cent, Sikhs 2.8 per cent, Jews 0.2 per cent and Zoroastrians 0.19 per cent of the population. These figures, however, are percentages of the communities that the project has identified.



Distress disinvestment

The manner in which the Government of India has disinvested 18 per cent of its stake in Gas Authority of India Ltd has raised questions about the integrity of the disinvestment mechanism.

V SRIDHAR

SELLING the family silver is always an emotive affair. It can turn controversial if family members who have a claim to the legacy suspect distress sale. Even those who believe that disinvestment of government stake in profitable and cash-rich public sector companies is a right step have faulted the Government for the manner in which disinvestment was done in the case of Gas Authority of India Ltd(GAIL). They have alleged that the Government, in a desperate move to bridge the fiscal deficit, sold 18 per cent of its equity in GAIL at a throwaway price of Rs.70 per share. But there is a more serious allegation, that GAIL's potential competitors – Enron Corporation, whose Indian operations have been dogged by controversy since the mid-1990s, and British Gas – have bought their way into the company "for a song". While Enron has acquired 5 per cent of the company, British Gas has acquired a stake of 1.3 per cent.

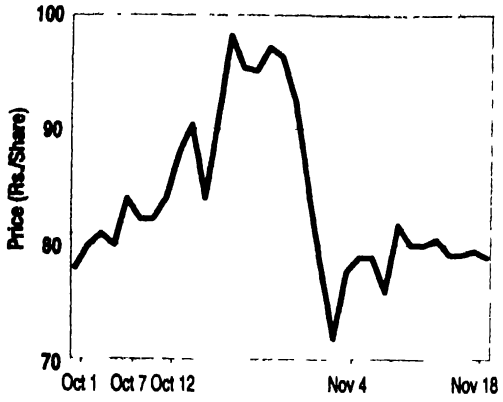
On November 4, the Government issued 22.5 million global depository receipts (GDRs) of GAIL to foreign investors at a price of $ 67 (Rs.420) each. Each GDR entitled investors to six GAIL shares. This resulted in the disinvestment of 135 million shares. The Government also retained GDR subscriptions for 20 million shares. The 155 million shares disinvested by the Government constitute 18 per cent of its stake in GAIL. The pricing of the GDR at Rs.70 per share meant a discount of about 11 per cent on the closing price of the GAIL share in the Bombay Stock Exchange (BSE) on the day of issue. The Government raised Rs.1,085 crores through the disinvestment and the discount implied a loss of about Rs.140 crores. The disinvestment, coordinated by Morgan Stanley and Jardine Fleming, resulted in the Government holding in GAIL declining from about 83 per cent to about 65 per cent. The issue followed the book-building process, a method by which investors are allowed to bid within a price band. Market sources explain that this process is used mainly to deter speculative investors and that it is adopted in issue-pricing when it is difficult to determine the intrinsic worth of the shares being offloaded.

V V KRISHNAN

At a GAIL facility.

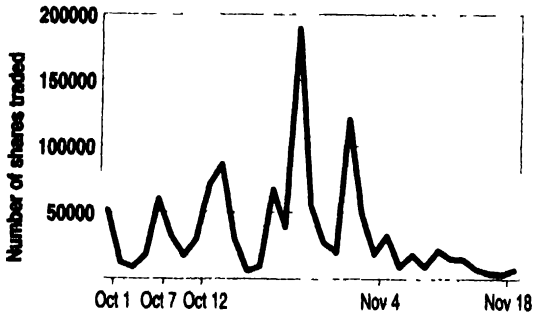
Former Finance Minister P. Chidambaram fired the first salvo on November 8 when he drew attention to the fact that the United Front Government had rejected a price of Rs.115 per share in mid-1997. He said the Government had been advised to expect a price in the region of Rs.150-170 per share. The pricing of the share at Rs.70 was "scandalous", he said and pointed out that apart from Enron and British Gas, foreign institutional investors (FII) had picked up "significant quantities of the offer". He said the Government's handling of the GAIL issue made the entire disinvestment process "open to ridicule". "Doubts will be raised about the integrity of the disinvestment mechanism," he said.

The criticism grew stronger when, a couple



of days later, Mahanagar Telephone Nigam Ltd. (MTNL) abandoned its GDR issue, citing the low price of acceptance in the international market (see separate story). There were questions as to why the Government could not have rejected the low offer for the GAIL share. The Polit Bureau of the Communist Party of India (Marxist) called for a "high-level probe into the scam" and asked the Government "to stop dismantling the valuable public sector assets in such a surreptitious manner for private gains." S. Dev Roye, secretary, Centre of Indian Trade Unions (CITU), told *Frontline* that the Government's action in the GAIL affair was "unpardonable".

The All India Congress(I) Committee's (AICC) economic affairs secretary, Jairam Ramesh, who was connected with the decision-making process during Chidambaram's tenure as Finance Minister, alleged that multinational companies had made a back-door entry into the Navaratna company which enjoyed a market share of 95 per cent in the natural gas business in India. He told *Frontline* that a "strategic sale to Enron would have got the Government at least three times more." He also pointed out that it was the first time corporate entities had picked up a stake in a public sector company. He observed that during the disinvestment in the Container Corporation of India (CONCOR), corporates had been kept out as a matter of principle.



Jairam Ramesh said that British Gas acquired a stake in Gujarat Gas in 1997 from the Mafatlal group at a price of Rs.270 per share. He reasoned that if the shares of Gujarat Gas, a much smaller private sector undertaking in terms of its capacity, could get this price, the GAIL shares deserved much more. Jairam Ramesh and several other people have also pointed out that a "negotiated price", a strategic sale in other words, to those who had an interest in acquiring a stake as a long-term investment in GAIL, would have been a better option.

There are allegations that the Government has allowed Enron and British Gas, which acted as casual investors, to acquire a strategic stake in a company operating in their line of business. Both Enron and British Gas have ambitious plans for the Indian market. There are fears that their entry into GAIL will enable them to leverage their way into its projects, reducing the scope for competition. Seen from this perspective, their acquisition of a stake in GAIL makes sound business sense (see box).

GAIL: Share price movement in the BSE

Volume of trading in GAIL shares in the BSE

In defence of its action, the Government said that there was nothing in the guidelines that prevented corporates from acquiring a stake in public sector companies. Although Finance Ministry sources said that the top management of GAIL had approved the entry of entities such as Enron and British Gas into the company, a senior GAIL official told *Frontline* that the company was not involved in the decision-making process. Officially, the company has maintained that the Government as the owner of the company has the final say in matters relating to ownership.

Sources in the market say that the Government had tied its own hands by signalling to the market that it was desperate to raise revenues from the sale of its equity in public sector companies in order to reduce the fiscal deficit. The time frame for this was also limited because the Government had a target of raising Rs.10,000 crores before the end of the financial year in March 2000. In fact, in his first major interview after assuming office following the recent elections, Finance Minister Yashwant Sinha said that he planned "unconventional and innovative approaches" to achieve this. He also said that "a couple of big ticket items" were being considered.

Getting the price right is always difficult. This is particularly so if the market is imperfect or if it lacks depth. These conditions enable the players to manipulate markets. Some facts about the shareholding pattern in GAIL need reiteration here. Of the 17 per cent of the equity that was outside the hands of the Government before the GDR issue, about 10 per cent was with Indian Oil Corporation and the Oil and Natural Gas Corporation. These shares, recently divested by the Government through a swap, were presumably a strategic investment, not meant for trading in the stock markets. Apart from this, the Government diluted its stake in three phases – totalling a little less than 7 per cent.

The first divestment, of 3.37 per cent of the government stake, was made in 1995. In 1997 the Government issued a small number of shares to GAIL employees. Later, in early 1999, the Government released 3.62 per cent of its stake in the company. Thus, only a small proportion of the 7 per cent of GAIL's shares were in active circulation in the Indian bourses. More importantly, this low volume of floating stock in the market determined the price of the November 4 issue amounting to 18 per cent of the equity of the company. In other words, in market parlance, there was little room for a sound price formation for the share in the market.

There are allegations that the Government has allowed Enron and British Gas, which acted as casual investors, to acquire a strategic stake in a company operating in their line of business.

It is common knowledge in the bourses that FIIs have a motive

Behind the growing interest

V. SRIDHAR

FORMED in 1984, Gas Authority of India Ltd. (GAIL) is a young company, and its assets are new. Its 4,300-kilometre-long cross-country pipeline network includes the 2,300-km-long Hazira-Bijaipur-Jagdishpur (HBJ) pipeline, which has recently been upgraded at a cost of Rs.2,000 crores.

Although the pipelines have been the primary assets of the company, GAIL has developed other linkages also in the last few years. One of the biggest producers of liquefied petroleum gas (LPG), the company owns five LPG processing plants with a total annual capacity of 750,000 tonnes. Two more LPG and propane plants, which will almost double the total capacity, are being established. GAIL is also constructing a 1,264-km-long LPG pipeline from Jamnagar in western India to Delhi to distribute LPG to companies that market it.

In March 1999, GAIL commissioned its first petrochemical plant in Uttar Pradesh. Built at a cost of Rs.2,500 crores, the plant is the first petrochemical complex outside western India. GAIL has also bid for a power project near Delhi in association with BSES, the private power utility. It plans to bid independently for medium and large gas-based power projects in the future.

The demand for natural gas is projected to increase sharply in the next decade. According to a British Gas projection, the demand in India will increase from 65 million metric standard cubic metres per day (mmscmd) to 300 mmscmd in the next 10 years. A large part of this is likely to be imported. In order to take advantage of this situation, GAIL has joined as a partner in Petronet LNG, which will establish liquefied natural gas (LNG) terminals for the import of gas. The Indian oil majors also have a stake in the joint venture.

With these arrangements in place, GAIL has a strong capability to expand as a major player in the gas retailing business. It has bid for gas fields so that it can extend its reach and ensure its own sources of supply. GAIL's earnings were nearly Rs.7,000 crores in 1998-99, and it made a net profit of Rs.1,060 crores.

Since the liberalisation process started in 1991, Enron and British Gas have been active in the Indian market. The two companies' operations in India are part of a process of consolidation by which the global energy conglomerates are vertically integrating their operations.

Although Enron in India is better known for its 2,450 mega watt power project at Dabhol, it is also active in the oil and gas sectors. It has 20-year contracts with two West Asian oil companies for the supply of 2.1 million tonnes of LNG, and the supplies will start by the end of 2001. Enron's LNG terminal at Dabhol is an important part of its Indian operations in the import and supply of gas to industrial and commercial users. The downward linkages for these plans are being provided by the oil and gas fields in the Mukta-Panna and Tapti oilfields, which are owned by the wholly owned exploration and production company, Enron Oil and Gas (EOG). The reserves from these fields are estimated to be over one trillion cubic feet of oil equivalent.

British Gas has a controlling stake in Gujarat Gas Company, the biggest private gas distribution company in India. It has a joint venture with GAIL, Mahanagar Gas Ltd., which is constructing a gas distribution system in Mumbai for commercial, industrial and domestic users. It is also developing a project for the import and regasification of LNG at Pipavav in Gujarat. It is also likely to supply gas to the power projects of the National Thermal Power Corporation (NTPC) at Kawas and Gandhar.

Both British Gas and Enron have extensive plans for gas exploration, imports and processing in India. However, they do not have a distribution network. A pipeline network, like the one that GAIL has, would be difficult and expensive to replicate. Extension of these pipelines to meet additional demand would be a low-cost affair for GAIL; in comparison, fresh investments by new players would be an expensive proposition.

Moreover, with its assets being new, GAIL offers tremendous advantages because maintenance costs are low. Being a new company the technology used by GAIL is also of recent vintage; for instance, its IT strengths are reputed to be of a very high quality. Moreover, its manpower productivity is also reckoned to be very good; GAIL's rapid expansion, for instance, has endowed it with quality project management capabilities in-house. The recent acquisition of interests in GAIL by British Gas and Enron thus makes very good business sense. That the price was low was an additional bonus for the two energy giants. ■

driving down the domestic price of a share on the eve of a GDR issue. A Mumbai-based merchant banker told *Frontline* that FIIs sold in the domestic market, retaining their option to buy in the overseas market because they knew that the price of the GDR issue was related to the price in the domestic market. In fact, soon after the first trends in the election results came in on October 7, the volume of trading in GAIL shares in the BSE increased sharply (see chart). Between October 7 and November 3, on an average 50,000 shares were traded each day. After the GDR issue — up to November 18 – the average daily volume of trading fell to one-fourth this level. During the phase of intense trading in the GAIL scrip, the price reached as high as Rs. 98 per share, on October 20. That the price was hammered down before the GDR issue is thus a strong possibility. If an investor sold 100 shares on October 20 at Rs.98 per share and subsequently bought the same number of shares via the GDR issue at Rs.70 per share, he would have made a net profit of Rs.2,800 out of the transactions.

Although Chidambaram and others have suggested that domestic investors deserved a chance to acquire the GAIL shares at a cheaper rate, there are others who see little merit in this argument. Selling government equity at a cheap price is indefensible under any condition, even if the buyers are Indian entities. In fact, merchant banking sources said that the Government's decision to disinvest 3.62 per cent of its stake in early 1999 was just as bad as its recent GDR issue.

In early June 1997, the GAIL scrip was

quoted at Rs.183 but a year later, in June 1998, it dropped below Rs.100. The price dropped below Rs.60 around the time the Government decided to make a domestic offer, in February 1999. It is significant that Finance Ministry sources have now justified the recent GDR issue by pointing out that this has been at a higher price than the sale in February 1999. Two things are missed in this explanation. First, the fact that the market, when it has tasted blood at a lower price, is likely to hammer the price again to a level close to that. Second, and more important, this is especially so if the market knows that the Government is desperate to push ahead with the issue regardless of the price.

An analyst in a reputed consultancy told *Frontline* that based on key parameters such as the book value of the GAIL share, the cash flow position of the company and the price-earnings ratio, which were important factors in the valuation of a company's worth, the GAIL share should have been sold for "several times" the Rs.70 that the Government earned per share. A merchant banker told *Frontline* that the recent issue price was likely to provide a benchmark for subsequent divestments in the company. He said that Enron was likely to play the "waiting game because it knows that one day or the other, there will be further divestment". In fact, Enron, by virtue of its 5 per cent stake in the company, is among the biggest non-Government shareholders in the company. Informed sources say that it can have a "nuisance value" in the company if and when it manages to get a nominee on the board because of its new-found status in the company. However, Yashwant Sinha has clarified that Enron will not be allowed to be on the board.

Although the option of a strategic sale has been recommended by some critics of the GAIL disinvestment, sources in the market say that this method of disinvestment can pose other problems. In a strategic sale the Government has the option of offering a stake to companies which may wish to take a controlling stake in the company. But the range of choices may be narrow in that case. Moreover, the bidders may form cartels to gain entry into the company at a low cost. While it may be true that in an underdeveloped market a strategic sale may be a better option in terms of price realisation, other adverse effects such as the formation of private monopolies may follow. ■

■ PSUs

Issues on hold

MTNL defers its GDR issue and its domestic public offer owing to adverse market conditions. What are the factors at play?

SUDHA MAHALINGAM

THE Government was all set go ahead with the global depository receipts (GDR) issue of Mahanagar Telephone Nigam Limited (MTNL) in early November, the depressed market conditions notwithstanding. However, on November 10, hours before the roadshow was to begin, it was decided to put off the offer of 19 million GDRs. Surprisingly, the advice to do this came not from within the Government, which should have been watchful of the market sentiment while selling the family silver, but from the merchant bankers Goldman Sachs, HSBC Investment Banking and Merrill Lynch, the global coordinators to the issue.

MTNL promptly set up a task force comprising its functional directors and representatives of the Department of Telecommunications, the Ministry of Finance and the Bureau of Public Enterprises to evaluate the advice. The conclusion was that it would be prudent to defer the issue and this was communicated to the core group of senior Secretaries. The issue has been put off until the market picks up; that is, possibly until the end of the current fiscal year.

S. Sundaresan, MTNL's Director of Finance, told *Frontline* that even the domestic issue, which was to have offered around 2.25 per cent of the paid-up capital as employee stock option (ESOP), had been deferred. The company's proposal to offer a maximum of 200 shares to each employee in the C and D categories who had opted for permanent absorption, had been approved by the Union Cabinet and an offer price of Rs.146 had been fixed. Even the public offering of about 1 per cent of the paid-up capital, which was also to be at a slight discount on the market price, had also been deferred, he said. The GDR, the ESOP and the public offer would have brought down government stake in MTNL to 51 per cent: currently, it is around 56.25 per cent. During the past six months MTNL shares had hit a high of Rs.230 and a low of Rs.154. The company's previous GDR issue, of 199[illegible] is quoted at a discount.

WHAT are the reasons for the luke warm investor interest in the scrip? S. Rajagopalan, MTNL's Chairman and Managing Director, told *Frontline* that the company's troubles with the Telecom Regulatory Authority of India (TRAI) had an impact on its rating in the international investor community (*Frontline*, November 5, 1999). "They don't go into the nitty gritty of whose case is right. As far as investors are concerned, MTNL was not able to deliver on its promises. The last time we accessed the global market we had promised that we would have our GSM (groupe speciale mobile) service operational by now. We have not kept that promise. Now, whether it is because of laxity on our part or because of obstacles placed by the policy/regulatory regimes is something that the investor is not interested in. It has impacted on our credibility. Similarly, the revenues in the last quarter dipped by 13 per cent. We can explain that it is because of the new tariffs recommended by the regulator, but international investors do not accept such explanations," Rajagopalan said.

According to Sundaresan, tariff rebalancing has cost MTNL Rs.100 crores. A part of this, however, could be recouped when the company claimed a tax holiday with retrospective effect from 1997-98, he said.

The Government has approved a proposal to amend MTNL's articles of association. An extraordinary general body meeting of the company held on November 19 approved a proposal to delegate the following powers to the board, which is now broadbased, with the induction of three persons from outside as directors: 1. To incur capital expenditure on the purchase of new items or for replacement without any monetary ceiling; 2. To enter into technological joint ventures or strategic alliances; 3. To effect organisational restructuring, including the establishment of profit centres, the opening of offices in India and abroad, the creation of new activity, and so on; 4. To create and wind up all posts including and

A curious buyout

SUDHA MAHALINGAM

THE National Thermal Power Corporation (NTPC), with reserves of Rs.12,000 crores, is to buy out its poor cousin, the National Hydro Power Corporation (NHPC), for a whopping Rs.4,500 crores. The Government hopes that the decision will not raise the hackles of trade unions since both are public sector units. On the face of it, too, the move seems non-controversial, since the Government will continue to retain control over the NHPC through the NTPC and will get a bonus of Rs.4,500 crores in the bargain.

However, the arrangement is a problematic one. The NTPC is a profit-making enterprise and has the largest installed capacity in thermal power generation. Its track record of adding capacity is good and contrasts sharply with the failure of the private sector to come up with the expected level of investments in the power sector. The move to make the NTPC buy out the NHPC will cause the diversion of precious resources from new capacity creation to the acquisition of existing hydel capacity.

It would not be unreasonable to assume that the main objective of privatising the power sector was to attract investments to bridge the demand-supply gap – investments which the Government could not mobilise by itself. The NTPC has been able to mobilise resources and has core competence in the power generation business. Instead of allowing it to do what it knows best to help narrow the demand-supply gap, the Government is now directing it to fritter away its resources by acquiring another PSU, one that is on the verge of a debt-trap.

The NTPC would have been able to add capacity to the tune of 1,000 megawatts at current rates with the Rs.4,500 crores it is to pay to buy out the NHPC. Had it leveraged this capital to raise further resources, it could have raised four times the amount. This would have enabled it to set up 5,000 megawatts of additional capacity. Instead, it has to use its strength to raise resources for the NHPC.

Union Power Minister P. Rangarajan Kumaramangalam, who was asked about this issue during the Economic Editors' Conference, failed to come up with a convincing defence. All that he could say was that the acquisition would unleash the synergies that the NTPC would require to get into hydel generation.

The Power Minister did not dispute that the funds will go into the government's kitty. He appeared to be quite satisfied with Finance Minister Yashwant Sinha's promise that some of it will come the Power Ministry's way. It is surprising that the Minister should be so sanguine even after what the Government did to the oil pool account and the road cess fund. ■

to those of non-board-level directors (the ard will be given powers to make appoint-nts up to this level, including the power effect internal transfers and redesignation posts); 5. To structure and implement nemes relating to personnel and human ource management, training, voluntary compulsory retirement, and so on; 6. To se funds from domestic capital markets d to borrow from international markets, bject to the approval of the Reserve Bank India/Department of Economic Affairs, be obtained through the administrative nistry; and 7. To establish financial joint ntures and wholly owned subsidiaries in dia or abroad with the stipulation that the aity investment of the public sector enter-se (PSE) should be not more than Rs.200 res in any one project, or 5 per cent of net worth of the PSE in any one pro-t, or 15 per cent of the net worth of the E in all joint ventures/subsidiaries put together.

The amendment is in tune with what the Government had proposed for all Navaratna public sector undertakings (PSUs). "It will give us the necessary autonomy to take commercial decisions to improve share-holder value," Rajagopalan said. He believes that the step will lead to a positive reaction in the market and push up MTNL share prices. Even so, he would like to look for a major catalyst that would push the price of the MTNL scrip high enough for a chunky divestment, whether it is in the domestic market or through the GDR route. That catalyst could come in the form of the coveted Chennai circle, for which some preliminary negotiations are on. It could cost up to Rs.1,000 crores, but for a company that is sitting on reserves of over Rs.5,000 crores, it is not awesome.

The amendment to the articles of association would also enable MTNL to place privately its equity with select investors. During the earlier GDR issue, British Telecom, France Telecom and Italian telecom companies had offered to take sizable stakes in the company. But, in lieu, they wanted their representatives on the MTNL board, a proposal that was not acceptable to the company.

The other option is to offload a sizable chunk of shares in the domestic market, at the risk of their all being mopped up by any one interested investor. A third proposal – to buy back MTNL's own shares and extinguish them – is also under consideration. The company has a paid-up capital of Rs.630 crores and Rajagopalan believes that downsizing the equity base will enhance value for the remaining shareholders.

THE company, with reserves and surpluses of Rs.5,619 crores, is chalking out plans to deploy its reserves gainfully. "We have a geographic limitation that prevents us from expanding horizontally. So we have to think of vertical integration," Rajagopalan said. Acquisition of companies that manufacture fibre optic cables and telephone instruments is also on the cards. MTNL is holding talks with companies manufacturing fibre optic cables. It may also buy out smaller telecom ventures, offering both basic and cellular services. There is also a proposal to take up basic telephone services in the satellite townships of Delhi. The company proposes to replace its 16 lakh cable lines with fibre optic cables.

Also on the anvil is a 100 per cent subsidiary, Millennium Telecom, which will take over Internet and other value added services. Its paid-up capital is likely to be around Rs.50 crores. MTNL plans to seek a strategic partner for the subsidiary once it is launched. Singapore Telecom has evinced interest in the venture and might participate in the equity as well, in which case MTNL's reserves will swell further.

Meanwhile, DoT has joined issue with TRAI on the Calling Party Pays (CPP) regime with a separate petition in the Delhi High Court: DoT has challenged TRAI's authority to issue directives asking that fixed-line subscribers be charged more for calls to mobile lines under the Telecommunications Inter-connection (charges and revenue sharing) first amendment. MTNL has also filed an intervention petition challenging TRAI's order on CPP, which, it claims, was issued even as the matter was being heard by the court. A Division Bench comprising Justice S.N. Variava and Justice S.K. Mahajan will hear the three petitions, of MTNL, DoT and TRAI, on November 30. ■

A politician and a painter

An exhibition in Delhi reveals another facet of former Prime Minister V. P. Singh.

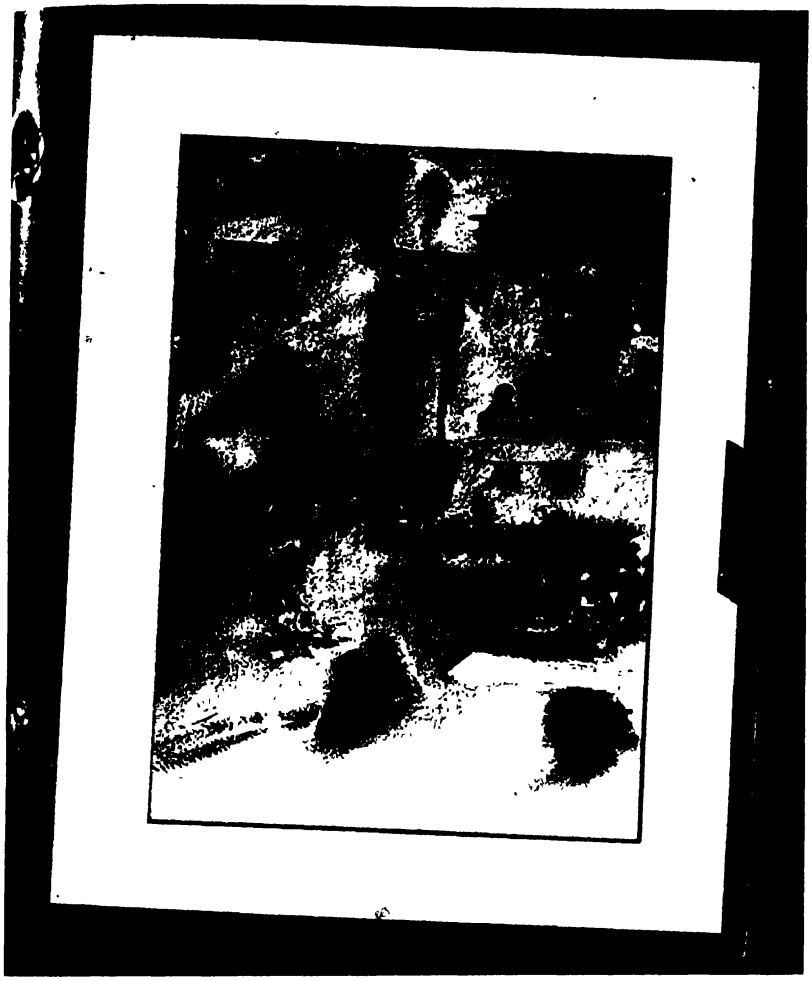
SUNEET CHOPRA

THE exhibition of the drawings paintings and graphics of former Prime Minister V P Singh at the Arpana Gallery of the Academy of Literature and Fine Art in Delhi to be followed by another in Mumbai s Jehangir Art Gallery is an important event Its importance does not lie in the fact that a former Prime Minister paints or writes poetry There are many examples of it in recent history British Prime Minister Winston Churchill used to paint Chairman Mao of China wrote poetry Thailand s King Bhumibol is a composer

What is important however is the fact that V P Singh s paintings reflect the importance of a politician being cultured at a time when specialisation has reached a level where a human being is reduced to a mere instrument of the overpowering might of bankers Their might is expressed in the globalisation of capital flows without any parallel let up on the immigration of people in direct contrast to this Money is free whereas people are constrained And slaves are not creative except in their struggle for liberation Creativity reflects the degree of freedom a people exercise in making choices about things concerning their lives And this is very important at least in the subcontinent today

It is in a challenge to this constraint of a totalitarian and monopolistic capitalism wanting everyone to fit neatly into a specialised slot that we can see the importance of V P Singh s works They reawaken the Renaissance concept of a person accomplished in various fields And this reawakening necessarily involves changes in an artist s attitude to the life around him as well

These changes show up in V P Singhs works too Whereas in the beginning his tendency was to appropriate a moment in time an object or an animal and render it in a drawing a graphic or a painting in keeping with the colonial artistic tradition his later works show just the reverse His art is no longer acquisitive It is an expression that goes out to the world today and in the future reflecting not only the growing stature of artists in India and the recognition of the fact by a former Prime Minister



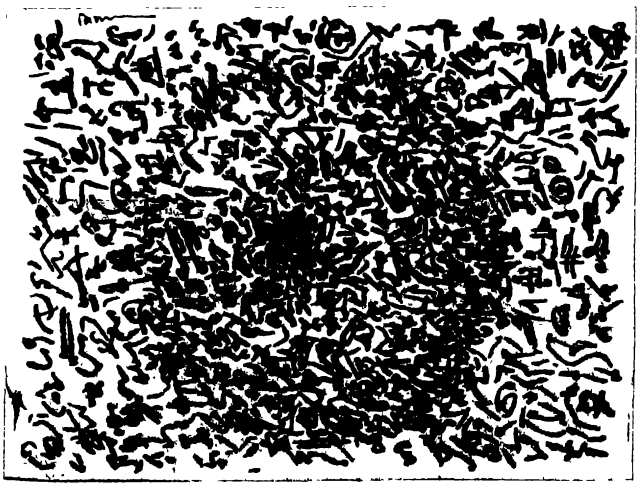
Animal Head, water-colour on paper.

This is borne out by the influence of a number of our artists in his work There is the crow of Anjolie Ela Menon the abstract landscapes of Bimal Das Gupta the flowing line of Bendre and the superimposed planes of water colour of Subroto Kundu and Paresh Maity He has known many of these artists and has learnt techniques from some of them but his expression is his own

This comes out most strongly in his imagery It is the expression of his experience and cannot be influenced so directly There is his image of a small man casting two large shadows on a wall The image communicates how no matter how grand and varied the accomplishments of any human being the reality is only as large as the body is This essential concern with the material comes out in other images too for in art all spirituality hangs from a material peg an object Objects both amounts of pigment or images, then express the artist s reality, just as handcarts lined up like cannons in one of V P Singh s more powerful works open up our eyes to both the organised character as well as the militancy of the working class

In one of his graphics a screen-print of ants coming together, we can see the collective power of small things in a big world, a theme that keeps recurring in his work But the vision that overpowers his expression is the coming

Street Scene, water-colour on paper.



together of opposites in a single space, the very essence of motion not only in the dialectical process in thought, but also in life. When an artist is able to express this naturally and unself-consciously, he can be said to have come into his own.

In this process too, however, the artist exercises a conscious choice. He may work either to highlight or harmonise opposites. And the artist does both at will. The best exercise at harmonising opposites is in his water-colour of an animal head, where the opposing sockets of the eyes and nostrils are held together by the form of the skull. The confrontational element is evident in his canvas of two shadows arguing against a wall.

The artist may do so spontaneously on the basis of aesthetic demands or on the spur of the moment. But once such works enter the world as finished products, they cannot just be treated as "pretty things". They have a close relation not only to productive processes, but also to society and the artist's perception of trends within it. An artist may not be fully aware of this. He or she may definitely "think" only with his or her hands. But even that thought is conditioned by individual experience of both society and the political attitudes in it.

In our age, anti-colonial, pro-poor and iconoclastic trends predominate. V.P. Singh reflects all of these. The handcarts arrayed like cannons; the street-corner worker being splashed by a passing taxi; the sacrificial goat; and the ill-omened crow, are all part of his repertoire. A particularly striking image is the "divided self", a small figure by a wall casting two large shadows or a dancer with one hand and one wing. It speaks volumes about the contradictory processes unleashed by man, whose creator and victim he is at the same

THE connection between V. P. Singh's politics and art may not be a direct translation from one to the other; but it definitely is transcreation. One can see in this exhibition a complex being, looking askance at the sharp dualism of wealth and poverty, backwardness and modernity, beauty and ugliness and trying to come to terms with it. We can see in the artist the man who some 30 years ago built a school in Koraon, carrying mud and bricks on his head or built a road to his family seat of Manda, doing voluntary labour alongside the local peasantry.The artist in him tries to draw as many strands together as he can. But then the politician in him takes a stand as in a drawing of hand-carts arrayed like cannons on a battle-field. Indeed his best work is that which is not just something to see but also gives one something to think about. ■

Prison riot in Chennai

The riot in the Central Prison in Chennai on November 17, which led to nine deaths, point to the need for jail reforms.

T.S. SUBRAMANIAN
in Chennai

IN the worst case of violence in the Central Prison in Chennai, nine prisoners and a jail official died on November 17. While the prisoners were killed in police firing, the official, Deputy Jailer S. Jayakumar, was burnt by prisoners.

Trouble erupted when rumours spread among the prisoners that "boxer" Vadivelu, who was in detention under the Goondas Act, had been beaten to death in the early hours of that day. (Jail officials maintained that he died of diarrhoea.) For about four hours in the forenoon, the prison compound turned into a battlefield. Hundreds of prisoners climbed on to the roofs of their blocks and atop trees and threw bricks, stones, tiles, knives, crowbars and so on at the jail staff and the police. Some of them twisted the aluminium plates supplied to them to have their food, into sharp instruments and attacked the staff. They ransacked the kitchen and threw out bags of rice and flour. Prisoners also hurled bricks on passengers at the adjacent Park suburban railway station

The police, who were outnumbered in the beginning, used teargas and rubber bullets and then resorted to firing. Police commandos and the Swift Action Force of the Tamil Nadu police opened fire after taking position on the staircase of the Park station, on a bridge and at other vantage points.

As arson went on inside the prison, flames leapt up from various points. The prisoners stabbed Jayakumar, set fire to the Remission Records Office and pushed Jayakumar in. He perished in the fire which destroyed records pertaining to thousands of prisoners. Thirty-seven year old Jayakumar is survived by his wife, a son and a daughter.

The intensity of the "war" was evident from the endless sorties made by ambulances and other vehicles carrying injured prisoners, jail staff and police personnel. Hundreds of screaming relatives of prisoners gathered on the bridge leading to the prison gates. At the nearby Government General Hospital, the police lathicharged a crowd of agitated relatives.

Three days after the incident, about a hundred persons had queued up before the prison around 9-30 a.m. seeking to see their relatives inside. Many of them had come from places outside Chennai. They had visited the General Hospital and two other major government hospitals in the city, at Royapettah and Kilpauk, looking for their relatives. Many injured prisoners were treated in the prison hospital itself.

Asokan, who came from Madurai, about 500 km from Chennai, to see his elder brother Kannan, said: "My brother has a bullet lodged in his neck. My mother has gone inside to see him. He was not taken to the General Hospital but treated in the prison itself. That means he is not in a bad condition, is he?"

THE Government was taken aback by the violence. Chief Minister M. Karunanidhi described the riots as unfortunate. Announcing an inquiry by a Judge of the Madras High Court, he said in the State Assembly on November 18 that the family of Jayakumar would be paid compensation and cash relief totalling Rs.8 lakhs. The families of the nine prisoners killed (one died in hospital later) would receive Rs.1.5 lakhs each. Karunanidhi said the Justice Ismail Commission (which inquired into the escape of a convict from the same prison nine years ago) had already made suggestions to improve jail administration. The new judicial commission would also be requested to make suggestions, he said. He denied that any prisoner had escaped from the jail during the trouble. There were 2,177 inmates; nine had died and 95 were receiving treatment (in hospitals outside), he said.

Earlier, Leader of the Opposition S. Balakrishnan of the Tamil Maanila Congress (TMC) said the Government should accept full responsibility for the incidents. He demanded the resignation of Law Minister Aladi Aruna. Members of the Communist Party of India (CPI), the All India Anna Dravida Munnetra Kazhagam (AIADMK), the Pattali Makkal Katchi (PMK) and the Communist Party of India (Marxist) sought a judicial inquiry. K. Subbarayan (CPI) said the riots could not be attributed to the death of Vadivelu alone. They had erupted because of bad jail administration, he alleged.

(Vadivelu, who belonged to the Kasimedu-Royapuram area in Chennai, led gangs that allegedly looted ships in anchor in the harbour. He gradually became a "dada" of the area: he mediated in disputes among local fishermen, traders and residents, controlled liquor trade, and owned fishing boats.)

Subbarayan said that since such riots had taken place earlier in the Central Prisons in Chennai and Madurai, the judicial inquiry should look into what fuelled them. Since there were rumours that Jayakumar had been burnt alive at the instigation of "some persons" inside the prison, the commission should go into the facts behind his death, he said.

Aladi Aruna, who gave an account of the sequence of events, said Vadivelu was jailed on January 25, 1999 following an incident involving fishermen. He was involved in two cases of murder. There were 30 cases of robbery and smuggling against him. He was the first accused in a case relating to the murder of two persons in the office of the Tamil magazine *Tharasu* in Chennai in 1991.

According to the Minister, Vadivelu had diarrhoea on November 16 and was treated in the prison hospital. He had diarrhoea again that night. Early next morning (November 17) he was taken to the General Hospital in the morning, where the doctor said that he was dead on arrival.

According to Aladi Aruna, in the morning Vadivelu's accomplices from

When the Superintendent realised that it was not possible to save Jayakumar and that the prisoners might escape by smashing the main gates, he opened fire with his revolver When the situation went out of control, the police were called in In the police firing and in the rioting, nine prisoners were killed and 95 injured Thirty-five jail officials, includ ig the Superintendent, and 45 policemen were also injured, the Minister said

Informed sources said that following ie Chennai incidents, the situation in the entral Prisons in Coimbatore and Madurai was explosive Major riots had roken out in the Chennai prison in bruary 1995 The following month, ots rocked the Madurai prison Prisoners went on a fast from March 18 to 21 There were minor riots by Al-Umma prisoners in the Coimbatore prison

JUSTICE M M Ismail, former Chief Justice of the Madras High Court, was asked to go into the escape of "auto" Sankar and his accomplices from the Chennai Central Prison in August 1990 In his report submitted in April 1992, he had made suggestions on improving prison administration Justice Ismail pointed out that although the prison building was in a bad shape, the Public Works Department was not prepared to spend money on repairing it According to him, the prison should be modified, taking into account the prisoners welfare, and run with a proper security system He suggested that educated persons be appointed prison staff and that they be trained for a year in treating the prisoners properly He also recommended that the number of prison staff be increased

In the report, Justice Ismail referred to his inquiry into the Emergency excesses in the Central Prison, Chennai, from February 1976 to February 1977 and said one-third of his report on the Emergency excesses dealt with reforms in prison administration

Justice Ismail had predicted that anything might happen inside the prison a prisoner might even be murdered by those charged with the responsibility of reforming him The standard of administration of criminal jurisprudence was the final arbiter of a society's culture and dignity, he added

The main recommendation was that Chennai prison, which is located in the heart of the city, be moved There was constant movement of people around the prison, he pointed It was not the proper place to keep undertrials, Justice Ismail said The prison is surrounded by the busy Central railway station, the Park station, the General Hospital and the Stanley road bridge Informed sources said the prison could be relocated on a vast tract of land away from the city They could be trained in handicrafts, agriculture, carpentry and so forth there This would have a calming effect on them The trades they learnt in prison would help them earn a living after their release The sources added "To the best of our knowledge, nothing has been done" on the recommendations of Justice Ismail ■

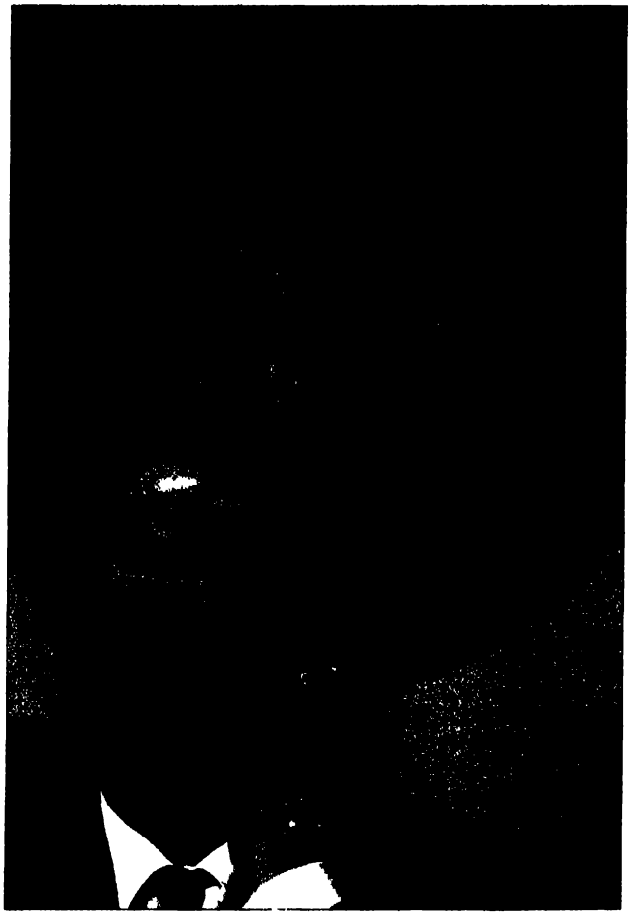
LESSONS FROM SEATTLE



The Third Ministerial Conference of the World Trade Organisation in Seattle once again revealed that in the world of trade it is power and politics and not altruism that determines the rules of the game.

C P CHANDRASEKHAR

LAST fortnight, confusion ruled Seattle, the site for the Third Ministerial Conference of the World Trade Organisation (WTO), which began without a formal opening and ended without a formal declaration Confusion prevailed both within and outside the convention centre, the venue for the ministerial deliberations

Outside, on the streets and at the intersections, an odd combination of protesters, with widely varying and even contradictory motives, jostled with one another and the police, to demand an end to the process of liberalising trade overseen by the WTO Dominating the demonstrations, which resulted in a cancellation of the opening ceremony, were U S trade unions and Western environmental groups The unions are against freer trade because it ostensibly pits U S jobs against imports, which are believed to be cheap because of poor labour standards in the developing world The 'greens were concerned that freer trade would only benefit the big multinationals, which, in search of profits, were not merely threatening health by genetically modifying food products, but also relocating in countries with inadequate environmental safeguards, putting at risk everything from rainforests to dolphins, sea turtles and butterflies At the fringes of the protest, however, were those who felt that WTO governance of trade was diluting national sovereignty worsening unemployment and adding to poverty in the Third World Unlike many of their comrades in Seattle, they believed that an emphasis on labour standards and environmental protection could be turned by the Quad' group (U S , Canada, the E U and Japan) into protectionist levers that would further widen the North-South divide

Confusion, both organisational and

REUTERS

PETER DEJONG AP

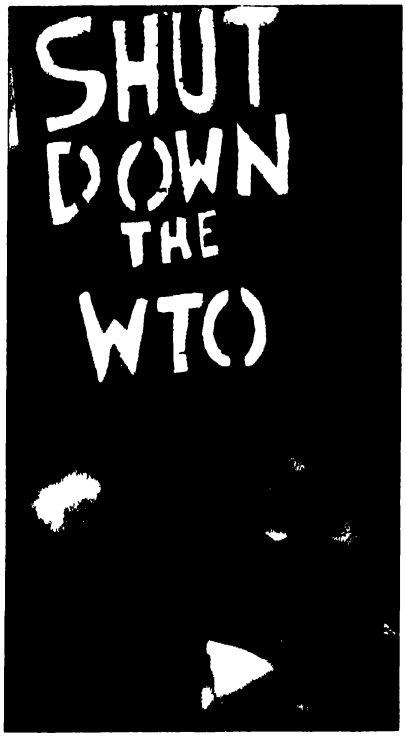
Michael Moore, the recently-appointed Director-General of the World Trade Organisation. His formulation that the Third Ministerial Conference was "condemned to succeed" was proved wrong by the collapse of the trade negotiations in Seattle. (Right) U.S. Trade Representative Charlene Barshefsky.

The Seattle police face demonstrators protesting against the ill-effects of the processes of trade overseen by the WTO. (Below) Commerce Minister Murasoli Maran addressing a press conference in Seattle. Developing countries, including India, had wanted greater attention to be given in Seattle to the iniquitous market access benefits that have flowed from the Uruguay Round.

ideological, permeated the conference venue as well. Many developing country negotiators arrived unsure of why they were there. They had started on the long road to Seattle more than a year back, with the idea that the principal task of the ministerial meet was to implement the mandate of the Uruguay Round and to complete its unfinished liberalising agenda in the areas of trade in agriculture and services. Further, given the inequities arising from the experience of implementing the decisions of that Round, they wanted the WTO to start a process of reviewing, reforming and, if necessary, partially rolling back some of the liberalisation already under way. Along the way, however, they were confronted by a suggestion from the European Union (E.U.), picked up and promoted by the U.S. and other developed countries, that Seattle should serve as the launch-pad for a new round of negotiations aimed

ELAINE THOMPSON AP

at substantially advancing the "opening up" agenda, with talk of investment agreements, competition policy, coherence and labour and environmental standards. The power of this group is such that by the time the Seattle meeting began, *The New York Times*, for example, declared that the meeting "is intended to open a new round of negotiations".



The E.U., in fact, was completely against review and reform in the contested agricultural trade arena, standing much to lose if it was forced to cut back on agricultural support and put an end to covert and overt subsidies. Japan and South Korea had also for long held that given its "multifunctional" character, touching even on lifestyles and cultures, agriculture cannot be treated on the same footing as manufacturing and services when trade liberalisation is discussed. They felt that focussing

LOREN CALLAHAN REUTER

BETH A KEISER A

REUTERS

An assortment of protesters, with widely varying purposes and motives, staged demonstrations on the streets of Seattle, during the WTO event. Some of them, dressed in sea turtle costumes, wanted trade to be linked to environmental protection measures; others demanded that international trade should be "clean, green and fair"; still others called for rather more radical action.

on a new round and new areas would get the heat off their back

E U Trade Commissioner Pascal Lamy joined Clinton in using the protesters as backing for his cause, arguing that their demonstrations rendered it "even less possible" to give in to U S demands to wipe out E U agricultural subsides in order to help American farmers

The E U 's intransigence was indeed reflective of what trade liberalisation has come to mean It was willing to ignore the original in-built agenda of the Seattle meeting to start in year 2000 negotiations in the contested areas of agriculture and services, even though these negotiations were mandated by the Uruguay Round, since they were the two areas in which the least progress towards reducing trade barriers had been made at that time Of the two, some progress was made in the services area in 1997 Despite this unfinished agenda and pressure from the U S to open up its agricultural product markets, the E U managed to hold out because of the implicit support from Japan and South Korea and differences within the developing country camp While there were some developing-country members of the

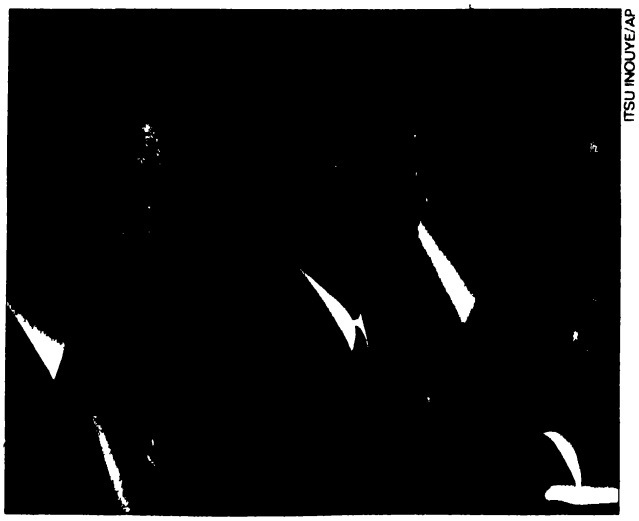
Cairns Group of agricultural exporters and some pro-market ideologues who were for agricultural trade liberalisation, there were other nations and sections that were worried, for valid reasons, about the impact such multilateral liberalisation can have on their farming community and their food security in the long run.

These developing countries, including India, were for greater attention to be given to the iniquitous market access benefits that have flowed from the Uruguay Round in the area of manufactures. In practice, not only have developing countries lifted non-tariff barriers to trade and bound their tariffs at relatively low levels, but they have unilaterally reduced tariffs to levels way below the promised ceilings. However, the developed countries have failed to respond similarly in crucial areas such as textiles and leather, where liberalisation has been tardy and restricted to products where developing country competitive advantages were minimal. Further, they were joined by countries, such as Japan, in questioning the use of clauses relating to "dumping" of goods in export markets, which allowed the U.S., in particular, to impose high tariffs on not-so-substantial grounds of unfair competition. In response to this experience the developing countries wanted the summit to pay attention to what were cumbersomely titled "implementation issues".

With an eye to exploiting these divisions among the 135 members of the WTO to advance its own domestic political and international trading interests, the U.S., led by President Bill Clinton, chose to play the role of a bully in a chaotic school yard. It had a wide agenda for a new round, including concessions on agriculture from the E.U. and Japan, further cuts in tariffs on manufactures, an extension of the moratorium on taxes on e-commerce, and linkages between trade and labour and environmental standards. Its first tactic was to use the demands made by some of the protesters to advance this agenda, signalled by the President's gratuitous welcome to demonstrators pouring into Seattle. Later, while regretting the violence resorted to by a small group, Clinton said that it is important to heed (selectively) the voice of peaceful demonstrators and put the question of worker rights and environmental protection on the agenda. This was not only meant to appease powerful democratic constituencies that matter in the run-up to the next presidential election, but also served U.S. trading interests.

Clinton then went on to advocate a working group on labour under the WTO, so as to start the process of making the lack of core labour standards in particular countries a basis for imposing protectionist tariffs and quotas on them. Outside the convention, in an interview to the *Seattle Post-Intelligencer*, he argued that the WTO should frame rules which allow for sanctions against countries violating core labour standards. Finally, in a symbolic gesture he signed in America's support for the treaty on child labour, which calls for a ban on what it treats as the worst forms of child abuse, including the use of child labour. The treaty, Clinton said, should serve as a model for enforcing other labour rights.

Given the clout of the U.S., it was not surprising that WTO Director-General Mike Moore chose to follow Clinton's strategy and pick on divisions within the developing-country camp to make a case for freeing trade further. Progress on this front, in his view, expressed in different ways, was crucial for the poorest of the developing countries. What he failed to note was the fact that the poorer and smaller developing countries were not being heard on the matter. According to the South-North Develop-ment Monitor (SUNS), the 67-strong ACP (Africa, Pacific and Caribbean) group of countries complained that their joint views (formally adopted at a meeting in the Dominican Republic) presented at a working group were not reflected in the Chairman's summary. Others were disappointed over the lack of transparency, and said that while the reports of the working group chairs claimed it was the result of consultations, it was not clear who had been consulted and where. As Victor Manuel, the trade representative of El Salvador, reportedly said: "They have continued with the old GATT way of doing business. They think they can meet in small gatherings and then announce that the two or three most important countries have already come to a consensus. It is very hard for small countries to have any influence on this process."



STEPHAN SAVOIA/AP

European Union Trade Commissioner Pascal Lamy.

The "big bully" attributes of the U.S. also came through in the way the convention was conducted by U.S. Trade Representative Charlene Barshefsky, who by virtue of being from the host country, shared the responsibility with Mike Moore. Choosing to go above the heads of most member-country representatives, she worked through secret dialogues with negotiators from the most powerful and recalcitrant countries, the results of which, if any, she expected the rest to go along with. One such result was a committee which was not authorised by the General Council of the WTO, to consider the possible linkage of trade and labour standards, which popped up midway through the meeting and received a hostile response from most developing countries.

The tenor of the U.S. strategy appeared to be that in return for minor concessions on what were the original items up for negotiations in the current stage of the WTO's record, the developing countries could be steamrollered into accepting a new

ITSU INOUYE/AP

Confrontation in Seattle

SRIDHAR KRISHNASWAMI
in Seattle

SEATTLE will remember the Third Ministerial Conference of the World Trade Organisation for a long time to come. After the delegates and the journalists have headed home and the dust settles, the WTO meeting will come under intense scrutiny in this northwestern city of the United States, and for many wrong reasons.

The Mayor, city officials, the local police, the Federal and Washington State administrations, business houses and various protest groups will each have an assessment to make. No group can claim victory or state that its plan of action "worked". The bottomline is not who won or lost, but what went wrong.

The Mayor and the police viewed the disturbances not in terms of a "battle" but as an expression of "free speech"; but to the hundreds of delegates from over 130 countries and the nearly 3,000 mediapersons assembled for the largest ever trade event in the U.S., it was nothing but a fiasco, a bungling of huge proportions.

However, the view of several delegates that the police did not have a firm grip on the situation and over the protesters may not hold good in the U.S., where the laws do not give sweeping powers to authorities to do whatever they want to do. In a developing country, even in democracies, the police would have taken thousands of people into preventive custody. But it has been pointed out that this is not possible in the U.S.

City officials admitted that they were caught napping. They had anticipated large protests, even handed out permits for demonstrations and were seemingly preparing for the worst. In the end all hell broke loose. The law enforcement authorities were taken aback by the orgy of violence unleashed by a very small group of self-styled militants and anarchists, who indulged in widespread intimidation, vandalism and looting.

Business houses in this beautiful and otherwise calm city are still picking up the smashed glass outside their establishments and trying to remove graffiti spray-painted on their walls. The losses are still being calculated. It will run into millions of dollars in not just damages but in lost business. The Christmas season is round the corner too.

A protester gets a blast of pepper spray from the police.

Long-time residents of Seattle do not remember any other point in the city's history – except perhaps during the Second World War – when curfew had been imposed for consecutive days. This was done so that the law enforcement authorities could "get back" the city from the violent and well-organised protesters, who wanted their views to be heard loud and clear. In the information age, laptops, palmtops and cellular phones came in handy for the marchers to get reorganised quickly and challenge the police from vantage points.

By way of what was to become of the WTO, the writing was on the wall. That the Seattle talks would be a write-off was evident even before the formal deliberations and meetings got underway. On the eve of the meetings, thousands of demonstrators from all walks of life and representing a variety of causes – many of which had nothing to do with the WTO *per se* – had descended on the city and started clogging the streets. But city officials were perhaps under the impression that these "curious" onlookers would make some noise and leave.

To say that most demonstrators who showed up in Seattle indulged in violence or were keen on provoking the authorities is wrong. It was a small group of people wearing black hoods and black masks that started it all. Something suddenly changed in the carnival-like atmosphere.

The gangs assaulted delegates, spat on them or sprayed ink on their clothes, and even targeted stores, banks and anything else they could lay their hands on. While local television stations were showing it live, the police were outnumbered and could concentrate only on one or two areas. The police in full riot gear, the mounted police officers and even those in black armoured vehicles did not deter the arsonists.

And then came the red pepper gas, either sprayed or shot as small rubber projectiles. These rubber projectiles, called "stingers", were generally aimed below the knee; and according to one police official, "they really sting" to the point of momentarily incapacitating a person. This correspondent witnessed numerous instances of police spraying pepper gas, and finally dragging away small groups of people for arrest. The first day's tally of arrests was a "modest" 70 or so.

On the opening day, November 30, the ceremonies were scheduled at Paramount Theatre, where U.S. Secretary of State Madeleine Albright,

United Nations Secretary-General Kofi Annan, WTO Director-General Michael Moore and U.S. Trade Representative Charlene Barshefsky were to speak. None of them could make it out of their hotel rooms.

The opening ceremony was cancelled, Albright headed back to Washington D.C. without giving her speech and only a handful of delegates could make it to the convention centre for the start of the sessions, or to read out their "speeches". As night fell, came the painful decision of the 12-hour curfew. President Bill Clinton checked into his hotel suite while the curfew was on.

The National Guards were summoned and hundreds of other police officers and troopers were requisitioned from neighbouring counties and States to help out the beleaguered Seattle Police. Day Two seemed to start off peacefully. The local police, with the reinforcements, appeared to have the situation under control. The curfew seemed to help matters in the sense that the Streets of Seattle were finally got "back", even though this had to be done inch by inch.

Determined not to be caught flat-footed or allow the town to be in the hands of the protesters once again, the police went into high gear. They used force, made mass arrests and basically let the anti-WTO elements know who was running the show. The number of arrests stood at over 500 on the second day.

Sweeping restrictions on movement helped matters momentarily, but the protesters were only waiting until dark. They arrived with cannisters of pepper and tear gas, stun grenades and the works. Hundreds of defiant protesters changed tactics. Instead of focussing on the "ills" of the WTO, they chanted slogans on the aggression and heavy-handedness of the law enforcement agencies.

The police wanted the city back; the protesters, citing among other things the right to free speech, wanted their streets back. This resulted in a different kind of pressure on the Mayor and City Hall. On hand were charges of excessive use of police force and even a few instances of brutality, projected on local television stations. The Human Rights Watch called on the Governor of Washington and the Mayor to appoint an independent commission to inquire into the police action. The frenzy may be over, but it certainly will leave an impact on the Mayor's political fortunes. ■

round with a wide and damaging agenda.

In resorting to this strategy, the U.S. was clear that one fundamental "convention" adopted earlier in GATT and more recently in WTO proceedings would not be violated. This was that decisions would be based on consensus, allowing the developed countries to use their economic clout, stemming from their dominance over international trade and capital movements, to force some degree of compliance from the developing countries in trade negotiations. If that convention is dropped, and a vote taken based on the one-nation-one-vote principle provided for in the WTO's constitution, the issues of links between trade and labour and environmental standards would have gone out of the window, given the fact that the majority was against them.

Fortunately, partly because unity between the developed countries, especially on questions relating to agriculture and bio-engineered food products, could not be arrived at, and their combined pressure could not be wielded to try and enforce developing country compliance for a one-sided declaration heralding new trade talks, the Seattle negotiations collapsed and ended with no result.

The Seattle protests are confirmation of the increase in worker insecurity everywhere accentuated by the WTO and its dominance by the interests of MNCs.

Every section involved may claim success or refuse to accept failure. The protesters would say that they have been able to stall a new round, though not having such a round which covers labour and environmental standards could actually be a setback for U.S. trade unions and some environmental groups which seek to advance the environmental cause at the expense of everything else. The developing countries would return home saying that they have stalled the inclusion of these issues in future negotiations, even though no progress has been made on the demand to review and reform the trading framework created by the Uruguay Round agreement. The E.U. would be glad that it has, as yet, not had to retract on the question of agricultural support. And finally the U.S. would argue that it has put "implementation issues" on the backburner and brought to the front its principal concerns, especially the new ones relating to labour and environment, making them an informal part of any agenda for all future trade talks.

In fact, Barshefsky even made the collapse of the meeting an American 'decision', when she declared to weary negotiators: "My judgment and in turn the judgment shared by the Director-General ... was that it would be best to take a time out, consult with one another and find a creative means to finish the job." U.S. officials were still holding that their unfinished agenda would be revived in Geneva in six months' time. Meanwhile, Barshefsky held, talks on agriculture and services mandated by the Uruguay agreement can begin in January. Clearly, the U.S. view is that even though it has not clinched a deal, it has set the direction which any future talks would take. In the long haul it expects that, as happened with the last round of trade talks, which took almost a decade to get going in 1986 and end in 1994, WTO members can be tired into arriving at some agreement along the lines it desires. There are important lessons here for developing countries such as India. First, the Seattle talks once again reveal that in the world of trade it is power and politics and not altruism that determines the rules of the game.

The belief, therefore, that a multilaterally brokered liberalisation of trade would result in fair trade is completely misplaced. Second, the view that there are no choices other than participation in the WTO needs to be rethought if such participation is a sure route to turning the world trading system further against developing-country interests. Finally, if the most powerful in the world do not want to give up protection in traditional areas such as textiles and agriculture, and are seeking to win for themselves new instruments of protection in the form of labour standards and environmental conditions, going ahead with unilateral liberalisation of external economic policies at home would be mistaken, since the world trading system itself may foreclose the export benefits such liberalisation is expected to offer. The Seattle protests are confirmation of the increase in worker insecurity everywhere (including in the U.S. and the E.U.), accentuated by the WTO and its dominance by the interests of multinational corporations. It is time that developing countries recognise that this is true of their workers too. ■

Uncertainties ahead

The fiasco at the WTO event was in some ways predictable, given the diverse agendas and the antagonisms that surfaced in the run-up to Seattle; but its ramifications could well prove incalculable.

SUKUMAR MURALIDHARAN

WITH acrimony mounting and chances of a decisive outcome to the Seattle Ministerial Conference hitting a trough, WTO Director-General Michael Moore came up with a memorable formulation: "Condemned to succeed." In other words, the Ministers and officials cramming Seattle's convention centre could not continue arguing at cross-purposes. As the deadline for agreement neared, discord would simply have to give way, since the stakes involved were too high to condone failure.

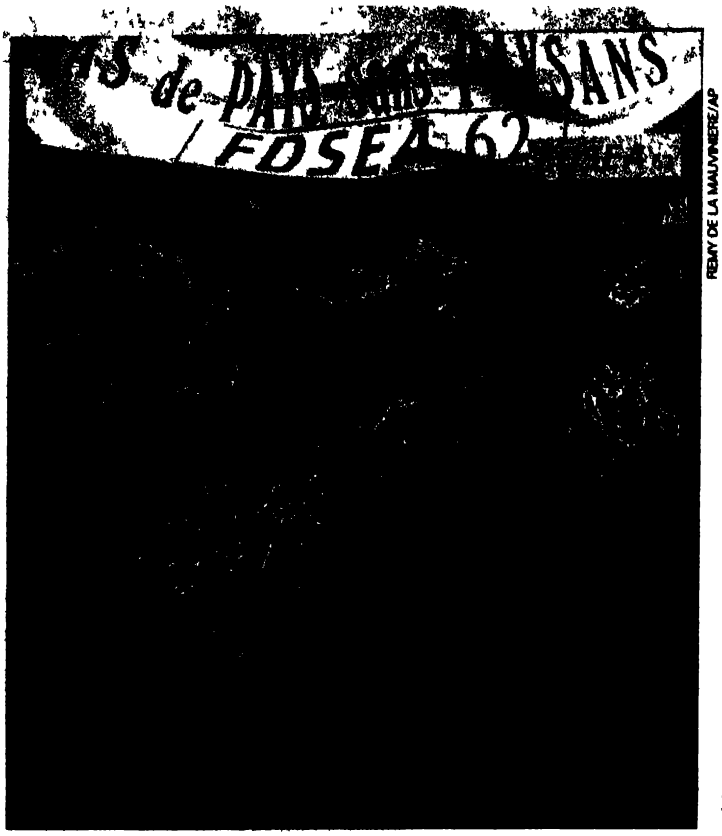
By the time these words were uttered, the atmosphere in Seattle was already bristling with new antagonisms. U.S. President Bill Clinton had made his appearance with all the trappings of an imperial overlord come to visit his flock. As the chief host of the conference, he was received with courtesy and heard with exceeding politeness. But the contents of what he said only deepened the sense of disquiet about the host's intentions, transforming the gathering into a quarrelsome multitude that could not possibly reach an adequate compromise.

Moore was altogether too complacent in assuming that there was an underlying harmony in the attitudes of the diverse nations assembled in Seattle. It was a presumption that flowed from a rather uncritical appreciation of the process of globalisation and the supposed benefits it conferred on all parts of the world.

The months leading up to Seattle had been marked by the kind of discord within the WTO that should have provided Moore with an adequate foretaste of the odds he faced. First, there was a months-long stalemate over choosing a person to head the organisation, with the Asian bloc strongly pressing the claims of a Thai politician against the West's advocacy of Moore. An election would have ruptured the WTO convention of decisions through consensus, with incalculable consequences for its entire method of operation in the future. Finally, a tenuous compromise was worked out, under which the two candidates would split the six-year term evenly between themselves.

More ominously, an effort to hammer out an agreed agenda for Seattle broke down just a week prior to the meet. This was the culmination of a tortuous process at the WTO headquarters in Geneva which saw the U.S., the European Union and Japan – the three powerhouses of the global economy – rapidly raising the pitch of mutual recriminations. An early draft reflected some of the concerns of the E.U. and Japan, in its emphasis upon investment rules, competition policy and anti-dumping regulations. A revised proposal submitted by the U.S. played down all these concerns, instead highlighting the liberalisation of trade in agriculture and services. The E.U. and Japan rejected the proposals on sight, accusing the U.S. of seeking to "rig the agenda" for a new round of global trade negotiations.

In the prelude to Seattle, the U.S. also sought to dilute the elements of a draft agenda that would provide the least developed countries a degree of flexibility in meeting WTO commitments. Going into the ministerial meet, the writing was already on the wall. With a shrewd appreciation of the odds, *The Economist* of London, as energetic a drumbeater for free trade as any, warned of the dangers ahead: "There is indeed a danger that Seattle will turn out to be a fiasco: no agreement on an agenda, or a half-hearted one that will obviously lead nowhere. If that happened, it would encourage anti-WTO groups to go on the offensive. America, the E.U. and Japan would increasingly be tempted by managed trade. The E.U. and America would redouble their efforts to carve up markets through regional preferential trade agreements that can only undermine the multilateral approach to trade."



President Clinton had been the most assiduous in urging that Seattle should mark the beginning of a new round of global trade negotiations. Since the U.S. has always been the driving force behind its predecessor – the General Agreement on Tariffs and Trade – there seemed little amiss about its effort to steer the WTO in a particular direction. But there were seri-

ous hazards inherent in the temporal coincidence between the WTO meet and the start of the U.S. presidential election process. For Clinton, Seattle was little more than an occasion to establish how he was intent on exerting the leverage offered by the U.S' uniquely influential global profile to secure the interests of American labour unions. The WTO ministerial was, in this sense, a barely disguised overture to the trade union vote bloc on behalf of Clinton's designated successor, Vice-President Al Gore.

REMY DE LA MAUVINIERE/AP

Farmers carry sheaves of wheat in Paris on November 25 in protest against U.S. demands to European Union member-countries to cut back on agricultural subsidies. The banner reads: "No countryside without farmers."

TRADE union insecurities had been compounded by the mid-November deal between the U.S. and China, which effectively cleared the most serious obstacles to the admission of China into the WTO (*Frontline*, December 10). On November 19, John Sweeney, president of the American Federation of Labor and Congress of Industrial Organisation (AFL-CIO), the most influential trade union confederation in the U.S., spelt out his concerns at the National Press Club in Washington, D.C. Repeatedly invoking the threat of a "confrontation" in Seattle, Sweeney warned: "The attempt to bring China into the WTO intensifies our determination, because we believe it is less likely to reform China, as its advocates claim, than it is to further deform the WTO. And it is more likely to detract from the WTO's already questionable legitimacy than to add to it."

Sweeney's worries were transparent. China's human resources would constitute a grave threat to the global dominance of U.S. industry and thereby endanger union interests. He was openly contemptuous of the arguments advanced on behalf of free trade: "Editorials pose a choice between free trade and protectionism, between engaging China and isolating it. This is nonsense. The debate is not about free trade or protection, engagement or isolation. We all know we are part of a global economy. And we are so engaged that we are already running a $60 billion deficit with China."

In other words, the trade deficit – virtually a chronic feature of U.S. economic performance over the last decade and more – is synonymous with an export of American jobs overseas. And if the WTO fails to inscribe into its charter uniform rules for labour all over the world, it would represent an unfair disadvantage for American labour. "So every day," said Sweeney in moral outrage, "some 250 million children across the world go to work rather than to school, making goods that flow freely across national borders. Every day, tens of thousands of workers are chained into forced labour and prison camps, slaving to make products that enrich global corporations and dictatorial governments."

It is an irony that these acute insecurities have cropped up at a time when the U.S. economy is celebrating its longest-ever phase of uninterrupted growth. There is perhaps an implicit comment in Sweeney's sentiments, as also in President Clinton's anxiety to accommodate them, on the stability and sustainability of the current economic boom in the U.S.

The inside story remains to be told, but there is an effort to spin out an interpretation that the U.S. President's strong message, invoking the possibility of trade sanctions against countries that failed to meet agreed labour standards, was his own initiative. In this narration, in his effort to secure the trade union vote for his designated successor, Clinton went well beyond the more subtle bargaining position that his negotiating team had adopted.

FUTURE historians may find it enlightening to excavate the truth behind these stories. For immediate purposes, it is sufficient that the President's remarks provided an insight of startling clarity into his country's ultimate intentions with the proposed new round of negotiations. The remarks made by his top negotiator, U.S. Trade Representative Charlene Barshefsky, just two days earlier, suggested an effort to work the labour standards issue into the WTO negotiating agenda without immediately pre-empting its outcome. The occasion was her address to the International Confederation of Free Trade Unions, a body that has rendered immense service to the U.S. cause during the Cold War and today stands in the vanguard of the struggle for universal labour standards.

Interestingly, Moore had on November 28 firmly ruled the issue of labour standards out of court in his appearance at the same forum: "What is true for the advanced economies is true for developing economies as well. Imposing trade sanctions – making developing countries even poorer – will not stop children being put to work. Or lift the living standards of their families. Just the opposite. Poverty, not trade, is the main cause of unacceptable working conditions and environmental degradation. And the answer to poverty is more trade and business, not less."

Moore suggested that rather than appropriate the mandate of the International Labour Organisation, the WTO should work in cooperation with it: "Most of the 135 members of the WTO are also members of the ILO. We represent the same taxpayers, the same governments, the same constituents. All these governments have an interest in improving their social and labour standards... All WTO's membership signed up to the Singapore

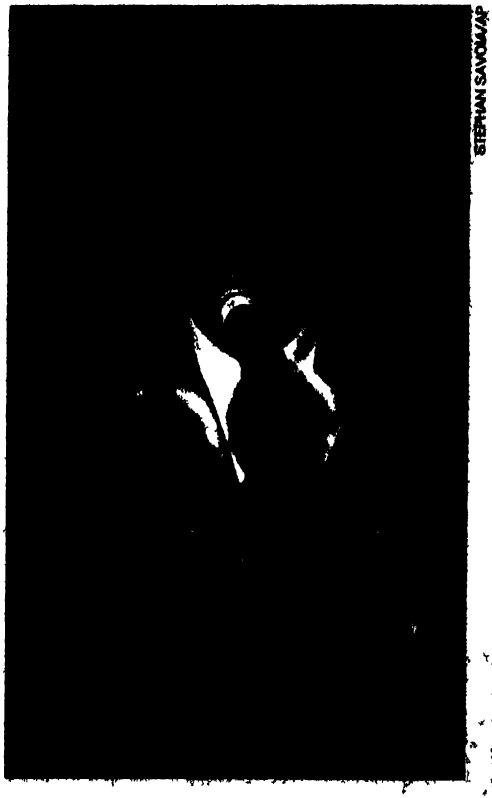
in Seattle

WHEN news emerged late in the night of December 3 that talks at the World Trade Organisation conference had failed, the protesters on the streets of Seattle let out cheers and greeted one another with "high-five" handshakes. Even though the talks collapsed primarily owing to serious differences between the United States and the European Union over the issue of agricultural subsidies, the protesters, who had faced rubber bullets and batons for four days, felt all the satisfaction of having won a hard-fought battle.

The clash between the WTO and its critics that exploded in Seattle had been brewing for almost a year. Activists and non-governmental organisations, emboldened by their success in scuttling the Multilateral Agreement on Investment (MAI) at the meeting of the Organisation for Economic Cooperation and Development (OECD) in 1998, moved quickly when they heard of the WTO meeting in Seattle and of the possibility that the investment treaty could resurface there under new aegis.

In this age of "Internet activism", organisers across the U.S. set up Web sites, newsgroups and e-mail list-serves to connect activists and participants throughout the world. Web sites such as www.seattle99.org and www.wtoseattle.org have been operating for months, providing directions, background information, schedule of events, accommodation outlets and even safety guidelines to those planning to attend. Some mischievous e-activists set up fake Web sites such as www.gatt.org that look otherwise identical to the official WTO site, but whose links lead to articles that lam-



While the Clinton administration tried to justify its agenda of introducing labour and environmental standards into the WTO saying that it was merely responding to public sentiment, the reality was more complex. At least 10 different organisations, representing a wide variety of concerns, came together in Seattle. They included trade unions, environmentalists such as the Rainforest Action Network, grassroots groups such as Direction Action Network, and even animal-rights groups such as the Humane Society.

THE common cause that unites many of these groups is not labour and environmental standards – something that India and the other developing countries sharply reject. Rather, it is a deep concern that the rules of the WTO permit multinational corporations to subvert the democratic will expressed by national electorates. The Rainforest Action Network, for example, is fighting the WTO because the latter puts trade provisions ahead of the laws of nations, so that power is shifted "away from local communities and given to corporations". People for Fair Trade, which organised many parallel events in Seattle, says that "the WTO speaks only for corporations and has become a global coup against democracy. It is the dismantling of democracy disguised as a trade pact." For example, the U.S. was forced by the WTO in 1996 to repeal sections of a 1990 pollution control law that were found to discriminate against imports from less-sophisticated Venezuelan refineries. Similarly, European regulations against the import of hormone-treated U.S. beef were ruled illegal despite the fact that European consumers are overwhelmingly in favour of tight restrictions on hormone-treated and genetically modified foods.

A number of NGOs have focussed on the fact that the benefits of free trade are often unequally distributed, and have damaging consequences for the most marginal segments of society. In a workshop presentation, veteran activist Walden Bello placed the WTO within a larger paradigm of economic development linked to the neo-liberal approach of the World Bank and the International Monetary Fund (IMF). It is deeply flawed, he said, because it dogmatically imposes a single model of economic development on all countries and negates the economic and social consequences of growth and trade.

Bello, along with Miloon Kothari, a Delhi-based NGO activist with the Habitat International Coalition, is among those who advocate a fundamental restructuring or dismantling of the WTO. Kothari was in Seattle as part of an alliance of NGOs that are concerned that the newly devised trade rules of the WTO will cause governments to compromise on or roll back earlier commitments on human rights, such as the United Nations Covenant on Economic, Social and Cultural Rights. "Trade has become an end in itself," he said. "We think trade should be a means by which people can achieve human rights objectives that countries have agreed to in the past."

There was some disappointment over the last-minute cancellation of Cuban President Fidel Castro's visit to Seattle. Meanwhile, the debate between Jagdish Bhagwati and Vandana Shiva offered some moments of excitement. In a public debate between the proponents and opponents of globalisation, U.S. consumer activist Ralph Nader joined Vandana Shiva to speak out against

STEPHAN SAVOIA/AP

Martin Khor, director of Third World Network, the Malaysia-based non-governmental organisation, addresses the NGO Symposium in Seattle on November 29. Most of the NGOs that came together in Seattle shared the concern that WTO regulations would permit multinational corporations to subvert the democratic will of

David Aaron, the U.S. Under-Secretary of Trade, and Bhagwati, a Columbia University Professor and an expert on trade. The acrimonious two-hour debate was high on sound-bites but low on substance as the two sides argued past each other to occasional applause from the packed audience. Bhagwati, polite and professorial, appeared confused in the debate, and occasionally scored points for his opponents by contradicting and disagreeing with Aaron. In the end, Ralph Nader and Vandana Shiva had outgunned their opponents with their rhetorical skills and thundering accusations that left Aaron looking hapless.

BUT the rancour and tension at the debate was nothing compared to what took place at the ministerial meeting itself. It is not clear if the fiery demonstrations on the first day shook the delegates' nerves, but the official deliberations remained without resolution after four days of tense and protracted negotiations. Delegates arrived in Seattle steeled for battle. Many, like those from India, came prepared with carefully worked out positions backed by strong political will and powerful domestic constituencies. But if much of the first day was lost in the protests, the proceedings on the second, third and fourth days were deadlocked in virtually every committee. The last two days saw non-stop negotiations as delegates struggled to make progress, and the final day's session was even extended by a few hours.

Many of the smaller developing countries complained bitterly that they were sidelined at the talks. But the dynamics of the WTO are such that it is inevitably dominated by the U.S., the E.U. and Japan that together control three-quarters of world trade, and consequently wield considerable influence over it. These three found enough stumbling blocks among themselves, from anti-dumping laws to export subsidies, to cause the entire proceedings to crash.

With protests outside and failure inside, the Seattle ministerial will go down as a major ignominy both for Clinton and the WTO. Many negotiators felt the talks would be re-ignited within six months, but the failure to launch a new round of trade liberalisation talks will leave a psychological burden of frustration and weariness that will take some time to overcome. ■

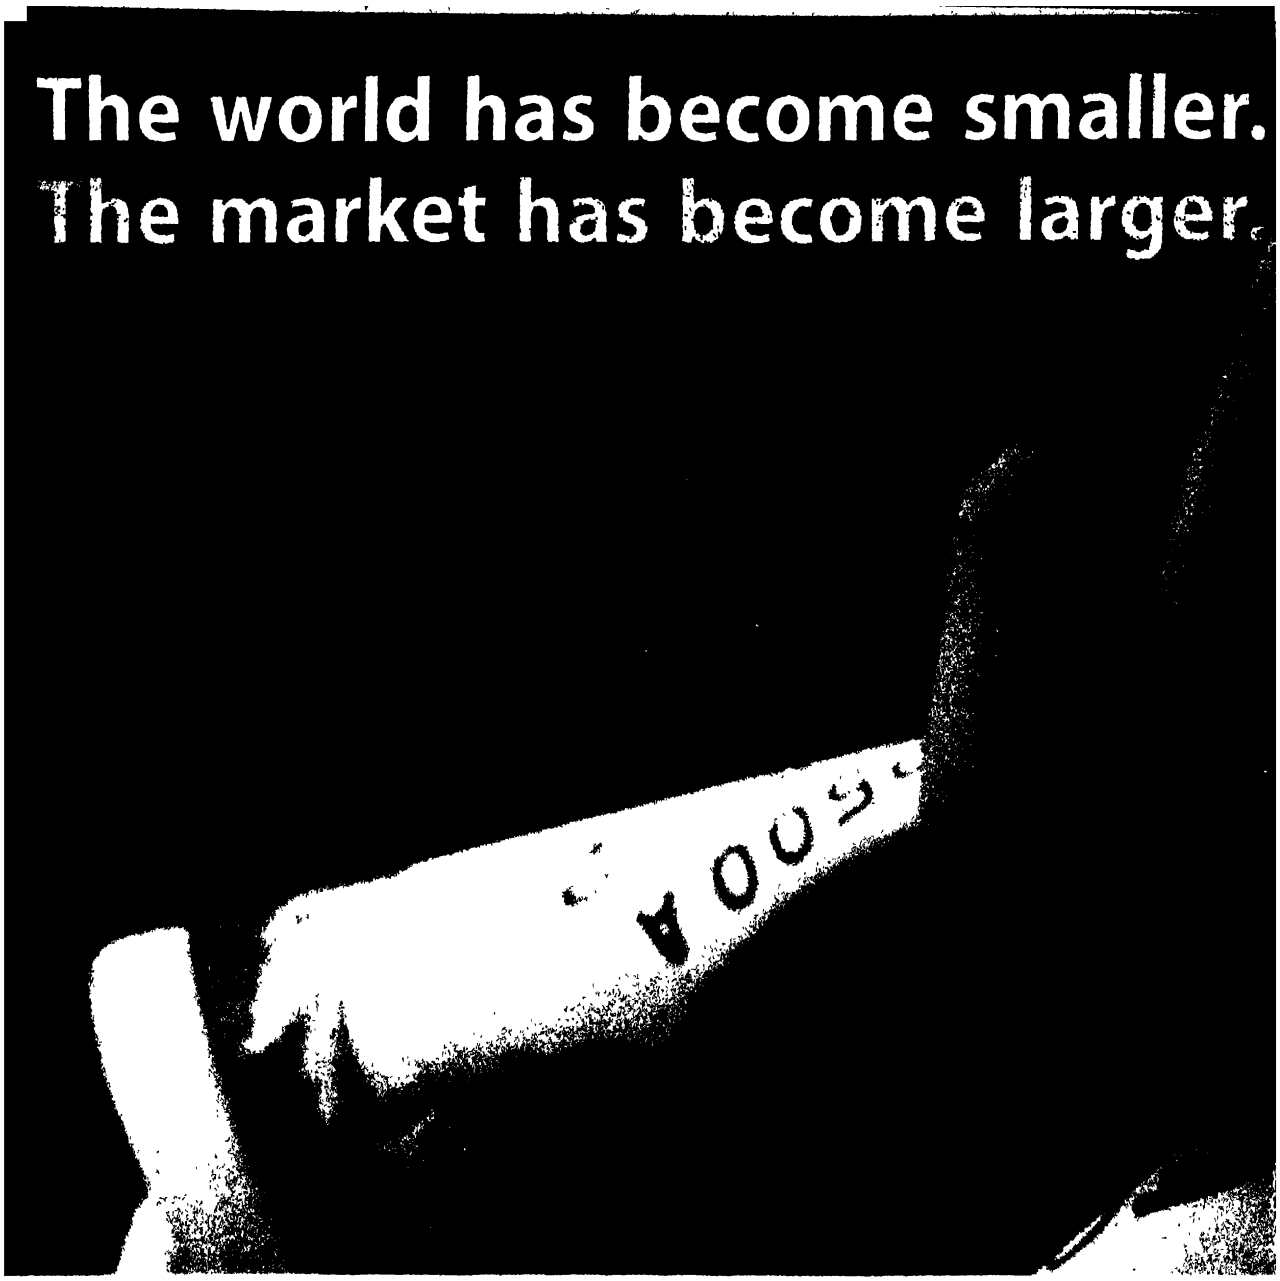
Declaration in 1996 committing them to core labour standards, opposing the use of labour standards for protectionist purposes and agreeing that the comparative advantage of countries – particularly low-wage developing countries – must in no way be put into question."

On behalf of the U.S., Barshefsky stated her opposition to this posture very clearly the next day "Today, in a formal sense, the WTO does not recognise that links between trade and labour exist This is not a position which can endure it is intellectually indefensible, and it will over time weaken public support for the trading system Thus we are not only seeking closer collaboration between the WTO and the International Labour Organisation, but also creation of a Working Group on Trade and Labour to examine seriously, in cooperations with institutions like the World Bank and the ILO, questions such as safety nets, the relationship between trade and internationally recognised core labour standards, and the best means of adjustment to heightened competition '

BARRY SWEET AP

John Sweeney, president of AFL-CIO.

THESE subtleties of interpretation were, of course, decisively brushed aside when Clinton invoked trade sanctions as the appropriate antidote to member-countries' default on core labour standards. Far from being an occasion that elevated the meet to a higher level of purpose, the presidential appearance in Seattle only hastened its unravelling



In the two remaining days, the U S tried every option to win an agreement On agriculture, it remained insistent on a final elimination of farm subsidies, but seemingly conceded some ground on "multi-functionality" – recognising European and Japanese claims that agriculture represented a special category of activity, intimately connected to the environment, national cultures and ways of life, that could not be equated with industry and manufacturing To win Japan s assent on the labour standards issue, it even offered to bring on board its specific grievances on the frequent American recourse to anti-dumping regulations But against the background of dissent from the more important developing countries, none of these stratagems could quite salvage the Seattle talks

In retrospect, to anybody who followed the tumultuous build-up to Seattle, it must seem rather outlandish that forecasts of a decisive outcome did for a while enjoy a certain credibility The fiasco of the WTO ministerial does not in itself represent a fatal blow to the global trading system It is not inappropriate to recall that the Uruguay Round of trade negotiations, which gave rise to the WTO, went into a seemingly irresolvable deadlock in 1990 It snapped out of the stupor only when Arthur Dunkel, Director-General of GATT (as it was then known), produced the *fait accompli* of an agreement that was known as the "Dunkel Draft' – providing the U S with the basis for individually working on all the recalcitrant elements and wearing down their resistance

A similar effort may be unnecessary right now, since most of the issues that proved contentious in Seattle, such as agriculture and services, will be taken up in Geneva early next year, as part of the continuing mandate of the Uruguay Round. In this context, it is worthwhile to probe into the recent conduct of the U.S Government to uncover its true motivations in seeking to launch a new round of global negotiations It is unlikely that the answer ultimately will need to go far beyond one factor The current conjuncture is a rare moment of global hegemony for the U S – an ascendancy as seemingly absolute as it is multi-dimensional Since ministerial meetings every two years have become standard procedure for the WTO, the U S obviously decided that the moment was appropriate to exert the leverage afforded by its economic, military and cultural power, to force an outcome of its choice in global trade rules

The effort came a cropper for the simple reason that the moment of absolute U S power is also one of maximum global disharmony Indeed, not in several decades has the global economy been as out of joint as it is now Cycles of growth and stagnation, which once were closely synchronised between the main global economies, are today completely desynchronised The growth that the U S econ-

omy is today witnessing – with its attendant phenomenon of a massively bloated stock market and rampant speculative activity – strains credulity for the simple reason that it is seemingly isolated from the rest of the global economy.

Digging slightly under the surface, the infirmities in the American economic miracle begin to emerge. First, economic growth today is being underwritten as never before by massive consumer spending. The growth in consumer spending today is the highest since the mid-1980s. This, in turn, is premised upon the appreciation of share values. Household incomes alone can hardly sustain the kind of consumer spending that is seen today. What is evident, instead, is the "wealth effect" – of households incurring massive debts in the belief that the appreciation of share market values will more than balance their books in the long term.

Optimistic projections of continuing economic growth assume that household expenditure will be in excess of income for the next five years, pointing to a faster accumulation of debt. Crucially again, much of this debt is incurred to overseas creditors, through a burgeoning American trade deficit. Over the last few months, the U.S. trade deficit has been just over 3.2 per cent of GDP. This represents a substantial change over a decade ago, when it was just 1.5 per cent of GDP. A part of this is explained by higher investments by American industry, which could conceivably bring in returns in future. But a large part of the explanation lies in debt-financed expenditure by American households. This is indeed the true face of the "export of jobs through trade" phenomenon that American trade unions have made much of.

To be able to sustain this situation, the dollar value must continue to remain high so that overseas creditors continue to put money into U.S. government guaranteed bonds. But the longer the dollar remains high, the greater will be the difficulty of bridging the U.S. trade deficit. Further, Japanese financiers have of late been giving indications that they will be shifting their investments, as the Japanese Government gets ready with a massive revival package for the ailing economy. The U.S. economy today is confronting what has appropriately enough been described as "an impossible balancing act". The Seattle meeting was perhaps an effort to impart a sense of stability to the U.S' precarious perch. And while the fiasco of the WTO ministerial was perhaps predictable, its many ramifications could well be incalculable. ■

■ COVER STORY

A high-stakes agenda

The Seattle talks collapsed owing to a hardening of negotiating positions by governments following an attempt by President Bill Clinton to raise the stakes on implementing labour standards.

SRIDHAR KRISHNASWAMI
in Seattle

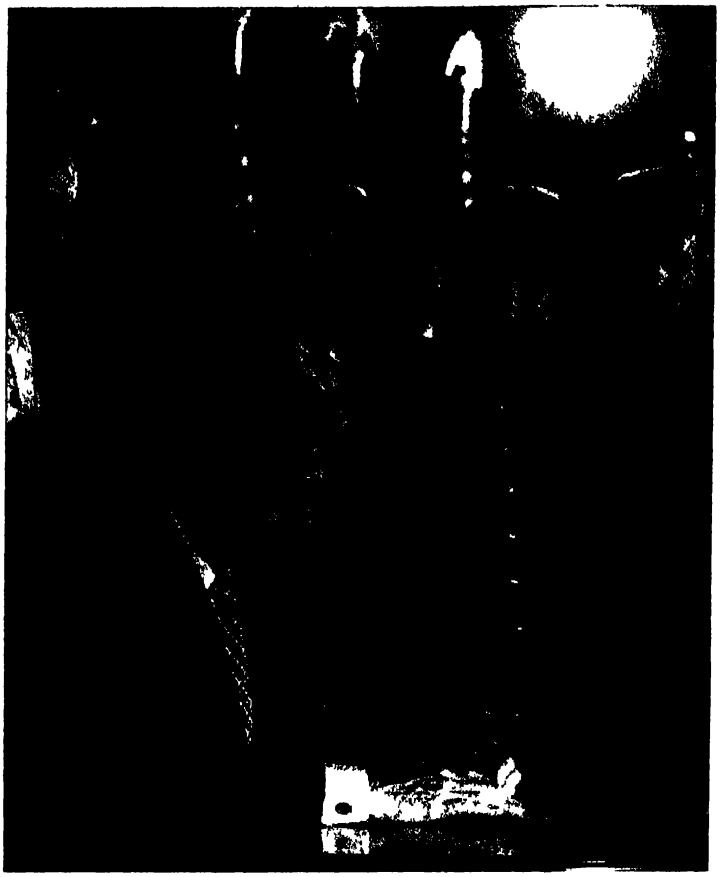
FOR President Bill Clinton, who had set great store by the Third Ministerial Conference of the World Trade Organisation in Seattle, the outcome is, in some senses, a setback. Administration officials may now try to convey the impression that all is not lost, and that the pieces of the failed trade negotiations can be continued from where they were left off, but clearly this is not going to be easy.

United States Trade Representative Charlene Barshefsky put a gloss on it and claimed that it was best to "take a time-out" and find "creative means" to finish the job. However, a senior delegate from Thailand seemed to sum it up a lot more realistically: "It started off on the wrong foot and we scrambled to get into gear. We couldn't get the big picture."

To say that the WTO fumbled because of the street protests would be stretching facts. The protests were certainly a factor, and the delegates were shocked by the level of violence, looting and intimidation witnessed during the first two days. But the talks failed because these act were compounded by a host of factors and issues. The negotiating positions of governments had become entrenched and the stakes had been raised at the last minute by none other than Clinton.

After having set artificial timelines and in some instances come to Seattle without getting a firm grip on the technicalities to be sorted out, a majority of the delegates from the 135 member-countries were appalled at the way the process was unfolding at the convention centre. Miffed at being left out of the negotiating process and concerned that the U.S., Europe and Japan were trying to hammer out deals behind the backs of the developing nations, they only hardened their stance. The African delegates were particularly incensed that they were being marginalised.

When the talks collapsed, those who had been keen on results argued that the way the meetings were structured would have to be reviewed. The developed countries perhaps believed that the select meetings in the "green rooms" would deliver results and that the agreements fashioned thus could be presented as a *fait accompli* to the developing nations. However, it had precisely the opposite effect.



As he does in most crisis situations, Clinton worked the telephone lines, calling a number of world leaders, including Japanese Prime Minister Keizo Obuchi. But many gaps remained and it became apparent in the last few hours that it would just not be possible to bury the differences and start a "millennium" round of trade negotiations.

It was not merely opposition from countries including India to the efforts by developed countries to link trade to the so-called core labour standards and environmental issues that torpedoed the talks. There was tough bargaining over various other issues – agricultural subsidies, anti-dumping measures, industrial tariffs, "multi-functionality" and the scope of a new three-year round that was to be launched in Seattle.

Some observers reasoned that it was owing to differences relating to agricultural subsidies that the meeting failed. The U S. and the 15-member European Union were involved in a heated debate over agricultural subsidies; the E.U. was unwilling to concede ground to those who demanded a pruning of these subsidies. Japan and South Korea pushed for efforts to maintain import barriers for rice. The U.S. and the Cairns Group were opposed to the use of "multi-funtionality" in the final text: the term relates to the concept that agriculture performs a variety of societal roles, including preserving rural culture and protecting the environment. Japan and the E.U. were keen to include this in the final statement.

The lack of transparency in the proceedings and persisting differences on agricultural issues were by no means the

only hurdles. There was a widespread feeling among representatives of the developing nations that the industrialised world, particularly the U.S. and the E.U., was trying to browbeat the Third World with tough talk on the farm trade and on the labour and environmental issues. Clinton's remark that the WTO should consider imposing sanctions on countries that did not comply with core labour standards strengthened suspicions about U.S. intentions, and that had a spillover effect in other areas.

KHUE BUI/AP

In Seattle on December 2, President Bill Clinton signs an international treaty which calls for a ban on "the most flagrant forms of child abuse", including the use of child labour.

THE Indian delegation led by Commerce Minister Murasoli Maran made it clear right from the start that India would not compromise on its principled refusal to discuss issues that were not directly related to trade matters – such as labour standards and the environment. In his statement to the conference, Maran said that India was firmly committed to environmental protection and sustainable development but that it would strongly oppose any attempt to change the structure of the WTO Committee on Trade and Environment or the mandate which then could be used to legitimise unilateral trade-restrictive measures.

On the subject of labour standards and workers' rights, Maran told the Ministerial Conference: "India resolutely rejects renewed attempts to introduce these in the WTO in one form or another. Any further move will cause deep divisions and distrust that can only harm the formation of a consensus on our future work programme." A senior Commerce Ministry official who was part of the delegation repeatedly made the point that India would not yield on this aspect. "We believe it is a Trojan horse for protectionism and our political mandate is to oppose it," the official added.

At the end of the conference, Maran told Indian mediapersons that when the delegation came to Seattle, it expected a more positive outcome that would advance the case for a multilateral, rule-based, non-discriminatory trading system. "Significant advances have been made. But in some areas, particularly non-trade related issues, there were wide divergences that could not be bridged," the Minister remarked.

India, said Maran, opposed the efforts to link trade to core labour standards, environmental issues, coherent global architecture, investment issues, involvement of non-governmental organisations in WTO negotiations and competition policy. "We hope that in the ensuing consultations a more constructive outcome will emerge on all issues for a balanced and equitable package," he added.

Among the developing countries, India was a major player in Seattle, but not the only major one. A few other countries in the Asia-Pacific, Africa and Latin America also protested against the manner in which non-trade issues were being brought onto or linked to the trade agenda. A top Malaysian official said: "Cheap labour does not necessarily mean exploitation... Is it too difficult to accept that countries have different levels of development? Some countries are just not as rich as other countries."

Clinton may have wanted to make gains from the conference and add it to his list of foreign policy "successes". It is not as though he had an ambitious agenda set out at Seattle and put little on the negotiating table. The problem was that Clinton had a political agenda and he raised the stakes at the very last minute. Prior to his arrival in Seattle, where curfew was in force, in an interview to the *Seattle Post-Intelligencer*, Clinton used the 'S' word – sanctions. Calling for the delegates to adopt the U.S. position for a working group on labour that would develop core labour standards which would then be part of every trade agreement, Clinton said, "... ultimately, I would favour a system in which sanctions would come for violating any provision of the trade agreement." The President also said that Americans should not buy products from companies that exploit workers. Senior officials scrambled to say that the President's comments were only to be seen as a "goal" and not a negotiating plank for the WTO ministerial. But the damage had been done.

Labour and environmental groups are core supporters of the Democratic Party; Clinton perhaps wanted to play to this gallery and see if he could have it both ways. Clinton reckoned that if, by talking tough on issues of agriculture and farm trade and in speaking up for labour rights and human rights, he had got the delegates to sign on to his agenda, he would have had the labour and the environment groups on his side.

In Clinton's calculation, even if the WTO ministerial ended without an agreement, he would have had these groups on his side: to them, "no deal is better than a bad deal". The conference collapsed not so much because it was held in Seattle under siege-like conditions, but because it was held in a country where politicians and special interest groups have set their sights on the presidential and congressional elections due in 2000.

Big business at work

Multinational corporations, the prime movers of globalisation, are becoming involved ever more actively and visibly in setting the agenda for international trade negotiations among governments, in which big business has tremendous stakes. The Seattle meet was no exception.

V. SRIDHAR

"The idea was simple to identify those barriers to trade or opportunities for liberalisation on which both business communities (in Europe and in the United States) could agree as targets for government action We should put the business 'horse' before the government 'cart'"

– Timothy J Hauser, former acting Under Secretary of Commerce for International Trade, in a testimony before the House Committee on Ways and Means, Hearing on the New Transatlantic Agenda, July 23, 1997

"We want neither to be the secret girlfriend of the WTO nor should the International Chamber of Commerce have to enter the WTO through the servants entrance"

– Helmut O Maucher, chairman of Nestle and former president of the International Chamber of Commerce (ICC), in the *Financial Times*, December 6, 1997

IF the World Trade Organisation is all about free trade, and if giant business corporations are the principal agents of globalisation, what was big business' stake at Seattle?

Considering the immense clout of these corporations, the media at large covered surprisingly little about their role in the run-up to the Seattle conference For instance, it is little known that the Seattle Host Organisation (SHO), the key organiser of the ministerial meet, was co-chaired by the heads of the two Seattle-based global leaders in their respective lines of business – Microsoft and Boeing. At Seattle, corporate sponsorship rose to new heights, epitomising the predominant role that multinational companies play in world trade

During the run-up to Seattle, the SHO sought corporate sponsorship of the event. It said that "supporters will be welcome to participate in a series of private sector programmes organised by the SHO, and, where appropriate, the SHO will look first to sponsoring firms for key speaking roles During the WTO week, sector-specific conferences will take place, bringing together industry leaders, specialists and participants engaged in the key issues for the next round of trade talks The attendance for these sessions is limited, allowing for the greatest possible interaction between participants, officials and guest speakers" The SHO also said it would provide 'special briefings to contributing firms prior to the WTO Ministerial to ensure that they receive constant updates on the status of the ministerial meetings"

"Supporters" were entitled to invitations to the ministerial dinner, opening and closing events and private sector conferences The number of invitations issued to companies depended on their level of support For instance, "Emerald level" sponsors, who contributed $250,000 each, were allowed five guests for the ministerial dinner, the companies who had committed support, apart from Boeing and Microsoft, included General Motors, Ford, Deloitte and Touche (a consultancy and accounting multinational), UPS and Honeywell "Diamond level" sponsors, who paid between $150,000 and $249,999 each, included Hewlett Packard, Motorola, Lucent Technologies and the Port of Seattle Companies at the "Platinum level" included IBM, Caterpillar, Lufthansa, each of which paid up to $149,000 There were other sponsors – at gold, silver and bronze levels Signage and corporate material of the supporting companies were allowed at the conference, and the SHO's official Web site had links to the sponsoring companies' Web sites Sponsors provided about $9 million to conduct the meet

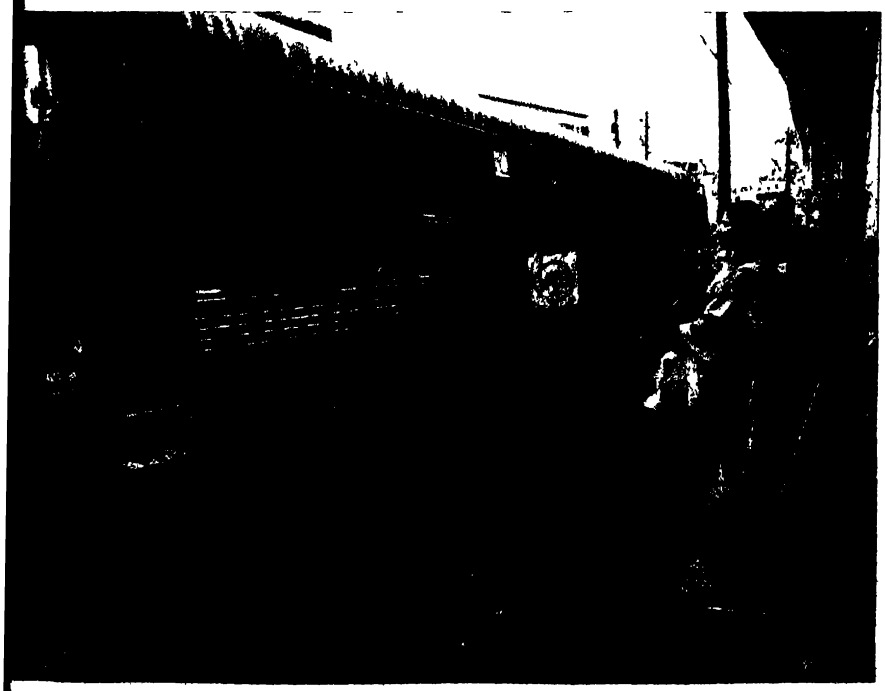
STEPHAN SAVOIA/AP

A campaigner draws attention to "corporate tyranny". At Seattle, corporate sponsorship operations rose to new heights.

The Seattle meet was not the first major international event for which such corporate fund-raising had been undertaken. Earlier this year, the celebrations of the 50th anniversary of the founding of the North Atlantic Treaty Organisation (NATO) was sponsored by U.S. corporations. About a dozen companies contributed a quarter of a million dollars each and their heads were directors of the host committee of the NATO summit.

CRITICS of the WTO recall the agenda-setting role of multinationals during the Uruguay Round process which laid the basis for the transition from the General Agreement on Tariffs and Trade (GATT) to the WTO between 1986 and 1993. The large business corporations played a key role in bringing new issues such as Trade-Related Aspects of Intellectual Property Rights (TRIPS), trade in services and other issues on the agenda. These issues were traditionally outside the scope of the GATT process, which was mainly concerned with tariffs on goods trade. Business interests in the Quad – the U.S., Canada, the European Union (E.U.) and Japan – were particularly active in bringing the Uruguay Round to a successful conclusion.

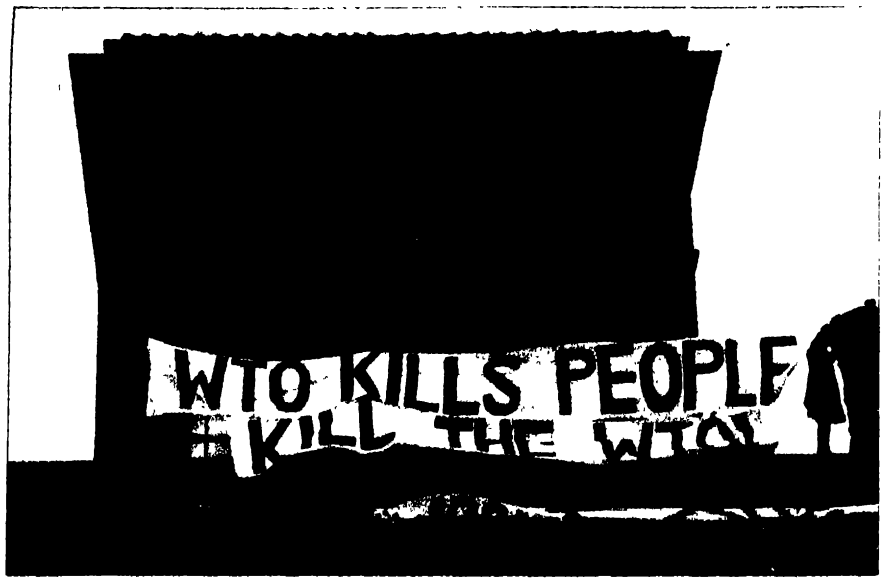
In the U.S., the Coalition of Service Industries lobbied the Government to form a separate regime for international trade in services. Multinationals such as Federal Express, Citicorp and American Express, and Arthur Andersen, the accounting and consultancy multinational, are part of the Coalition. The Intellectual Property Committee, a forum for 13 major U.S. corporations, including Monsanto, DuPont, General Motors and others, worked to incorporate TRIPS in the Uruguay Round. The former chief executive officer of Pfizer remarked in 1996 that "our combined strength enabled us to establish a global private sector government network which laid the groundwork for what became TRIPS". Critics have also pointed out the "strikingly similar" positions put forth by industrial lobbies and those presented by the official U.S. delegation during the talks on TRIPS during the Uruguay Round. Of the 111 members of the U.S. delegation, as many as 96 were from the corporate world.



In the U.S., the President's Advisory Committee for Trade Policy and Negotiations (ACPTN) includes representatives from leading multinationals such as AT&T and associations such as the Motion Picture Association of America, Inc. Representatives from multinationals such as Eastman Kodak, Monsanto and IBM account for nearly half the strength of the 42-member Committee.

In Japan, the Japanese Federation of Economic Organisations, the Keidanren, liaises with the Japanese Government and Parliament. Representatives from Mitsubishi Electric Corporation, Nissan and Toyota chair major committees in the Keidanren. In Europe, while the members of the European Round Table (ERT) lobbied with national governments, the Union of Industrial and Employers Confederation of Europe (UNICE) worked closely with the E.U. leadership. In the Organisation for Economic Cooperation and Development (OECD), the Business and Industry Advisory Committee (BIAC), of which the ICC is an important part, plays an important role in shaping the industrialised countries' agenda at the WTO.

Lobbying by business played a key role in clinching the three international agreements that were signed at the WTO in 1997 – on Information Technology (IT) products, on telecommunications and, most significantly, on the liberalisation of financial services. All three, said former E.U. Trade Commissioner Sir Leon Brittan, were "jewels in the WTO crown."



The agreement on financial services, which came into force on March 1, 1999, is expected to liberalise 90 per cent of the world market in insurance, banking and brokerage services. The agreement marks a significant step in opening up markets in the countries of the South to the multinational financial entities. Although the agreement allows countries to file specific reservations, it locks them in terms of liberalisation and market access, preventing the establishment of controls at a later date.

The E.U. and the U.S. governments lobbied extensively in Asian and Latin American capitals to clinch the agreement on financial services; the role played by corporate lobbying, however, received less attention. The Financial Leaders Group (FLG) played a key role in "identifying barriers to trade in other countries", according to the Dutch Ministry of Economic Affairs. The FLG included some of the world's biggest financial players – Barclays, Chase Manhattan, ING Group, Ford Financial Services Group, the Bank of Tokyo-Mitsubishi, Goldman Sachs and several other banking, investment and insurance companies. In a speech in Washington in September 1998, Brittan remarked that "the close links established between E.C. and U.S. industry... were an essential factor in obtaining the final deal." Brittan also said that the "high-level momentum to the negotiations" was provided by the E.U.-U.S.-FLG involvement. Brittan also said that the relationship will serve as a "model" for the "next round of services

BARRY SWEET/AP

Members of the Direct Action Network, and their vehicle of grassroots-level activism, in Seattle.

A banner with a telling message outside the WTO headquarters building in Geneva. There is intense anger worldwide directed at the WTO framework that has increasingly challenged national laws in several spheres.

liberalisation negotiations."

According to the WTO's critics, the E.U., emboldened by the success of its alliance with the FLG, initiated the formation of the Investment Network (IN). The IN, which brings together more than 50 giant companies, including Daimler-Benz (now merged with Chrysler), Fiat and British Petroleum, was established to articulate key issues to be brought on board the agenda for an international agreement on investment. The E.U. has also suggested the formation of a European association of service industries to "advise E.U. negotiators on the key barriers and countries on which they should focus on in these negotiations." A critic of the business-E.U. relationship observed that "by working closely together, the Commission presents the member-states with a negotiating strategy pre-approved by European industry."

SINCE its formation in 1995, the Transatlantic Business Dialogue (TABD), in which the biggest corporates from the E.U. and the U.S. participate, has focussed on the agenda that governments should take up at the WTO negotiations. Among the points raised by the TABD is the expansion of the "in-built agenda" which includes services, agriculture and TRIPS. The E.U. position, which favoured an expansion of the agenda at Seattle, is seen as a reflection of business lobbying at the TABD. The TABD also called for the conclusion of an Agreement on Forest Products and on electronic commerce.

At the TABD's fifth annual conference held recently in Berlin, over 100 CEOs from leading multinationals gathered to articulate their agenda for the Seattle meet. They focussed attention on non-tariff barriers to trade in the E.U. and the U.S. These related to genetically modified agricultural products, eco-labelling and recycling schemes in the E.U. They also demanded that the U.S. administration review its public spending provisions which are aimed at supporting local communities.

A commentator points out that the TABD is not an organisation but a "framework drawing on the resources of existing companies and organisations, to deliver joint industry messages." This is perceived to result in more efficient interaction than the "traditional structures for government-business consultation." The TABD is reckoned to be "arguably one of the most far-reaching and influential corporate-state alliances."

The ICC, which represents the interests of some of the biggest multinationals, was a major player in the move to float the controversial Multilateral Agreement on Investment (MAI). It also maintains close ties with the WTO Secretariat. An ICC official said that the ICC "has always been a vector for business input into WTO work... since the beginning of the multilateral trade negotiations." It also had "several informal contacts with the WTO on the new issues that the WTO is looking at," a senior ICC official said earlier this year. Its Seattle campaign started in May 1999 when an ICC delegation met German Chancellor Gerald Schroeder just before the G-8 summit. On the eve of the Seattle meet, ICC secretary-general Maria Livanos Cattaui, said: "Progress of multilateral trade liberalisation must not be allowed to falter... The rules-based multilateral trading system is one of the finest achievements of the twentieth century."

CRITICS of the WTO point to the increasing collaboration between business and some of the key figures involved in international trade negotiations since the Uruguay Round. For instance, Arthur Dunkel, who presided over much of the transition from GATT to the WTO, is on the board of Nestle, one of the world's biggest food companies. Dunkel also chairs the International Trade and Investment Commission of the ICC. Dunkel's participation in a WTO dispute settlement panel also raised questions of a conflict of interest.

Peter Sutherland, former Director-General of GATT-WTO between 1993 and 1995, now chairs the board of British Petroleum and is also an associate in Goldman Sachs International. According to the Friends of the Earth, Charlene Barshefsky, the United States Trade Representative (USTR), was earlier a lobbyist for the Canadian timber industry.

The dispute settlement mechanism in the WTO has come in for criticism on the ground that it is non-transparent; more seriously, the system is perceived to be iniquitous to resource-poor countries or to smaller companies operating from the developing countries. In the WTO, only member-states are allowed to raise disputes: when a company believes that it is affected by unfair trade practices in another country, it has first to convince its own government that the issue must be raised at the WTO. More important, governments must also act in defence of companies based in their countries which have been affected by unfair trade practices of entities in other countries. To protect themselves, companies must therefore have a good relationship with their governments if they want the authorities to pursue their case.

In many of the high-profile trade disputes that have arisen recently, corporates and their own governments have gone hand-in-hand to fight their case at the WTO. In the banana war between the E.U. and the U.S., Chiquita Brands International, which owns plantations in Guatemala, Honduras and Mexico,

joined legal action against the E U In fact, Chiquita, which controls a large part of the banana trade, helped the governments in these countries fight the case

In the beef and milk war in 1997, Monsanto, the U S National Cattlemen's Association, the U S Dairy Export Council and other interest groups lobbied with the U S Government to initiate action against the E U for its ban on hormone-treated beef imports on health considerations European animal health products companies, the European Federation of Pharmaceutical Industry Associations (EFPIA) and lobbied at the F U for a withdrawal of the ban because they claimed that it was affecting their interests as well

The Japanese and European governments acted on behalf of companies such as Sony, Toshiba Siemens and Philips Electronics against a Massachusetts law which penalises government purchases from companies that deal with entities in Myanmar which is under military rule They complained that the U S administration had also fought Kodak s case against Fuji for a share of the Japanese market for film and photographic paper Incidentally Kodak s CEO is a member of the ACPIN

THE WTO framework has increasingly challenged national laws related to trade, environment, food, technical standards, labour, and biotechnology, in trade jargon, these are together called "non-tariff barriers to trade' More than any other entity in the world, multinational corporations are equipped to engage in the globalisation process The United Nations Conference on Trade and Development (UNCTAD) estimates that more than two-thirds of world trade involves at least one multinational company Half of this is traded between companies belonging to the same multinational group These corporations are truly global Being the prime movers of globalisation, they have enormous stakes in managing the contradictions that arise between governments, which are answerable to people within their borders, and global business, which wants investment and trade to move freely in a seamless world.

Perhaps nothing epitomises the growing nexus between governments and big business as the spectacle of briefcase-toting Trade Ministers from across the world engaged in bargaining in Seattle. International trade bureaucrats and negotiators are another part of this spectacle.

To ensure the survival of the weakest

Interview with Dr. M.S. Swaminathan.

Dr. M.S Swaminathan sometimes recalls the excitement and effervescence during that period in the decade of the 1960s when a major revolution was brewing in the laboratories and fields of India The explosion in food production brought on by the introduction of high-yielding varieties of wheat and rice in India (and later in other parts of the developing world) created agricultural history With characteristic modesty, he deflects credit for his role in changing the face of agriculture in the developing world, but instead draws attention to the many lessons of what came to be called the Green Revolution Apart from its more obvious and recognised ones, he underlines the important political lesson drawn from that experience The Green Revolution disproved Malthusian predictions of famine and mass starvation for India It made India self-sufficient in food, a factor that played no small role in strengthening the country's political sovereignty and ability to withstand international pressures at a critical juncture

Yet it is clear that at the heart of his quest for a better, more equitable and healthier world is the challenge posed by contradictions of a situation where there is food self-sufficiency for a nation on the one hand and hunger for a growing a number of people on the other.

If there is one strand that runs through Swaminathan's distinguished five-decade public career as agricultural scientist administrator, innovator and thinker it is the concept of human welfare, a vision rooted in the ideals of socio-economic equity, women's equality, environmental conservation and ethics. For him, the food and livelihood security of nations, and of different groups and communities of persons within nations, perhaps constitute the foundation of human development Hunger gives rise to economic and social discord and leads to violence In a fundamental sense, therefore, Swaminathan s contributions to the theory and practice of human welfare have strengthened the movement for both

K. PICHUMANI

Regd No TN / MS (C) 790 / 99 LICENSED TO POST WITHOUT PREPAYMENT No. TN / MS (C) / PP - 130 & Regd. No.MH

equity and peace.

Recognition for Swaminathan's work and contributions to agricultural practice, environmental conservation, poverty eradication through the strengthening of opportunities for productive employment, women's empowerment, protection of indigenous conservation traditions and practices, and other pathsetting initiatives, have come from across the globe. He has held a series of front-ranking appointments – Director-General of the International Rice Research Institute, the Philippines (1982-1988); Independent Chairman, FAO Council (1981-85); Andrew D. White Professor-at-Large of Cornell University, United States (1989-95); Trustee of the Ford Foundation (1989-97); and President of the International Union for the Conservation of Nature and Natural Resources. He currently holds the UNESCO Chair in Ecotechnology at the M.S. Swaminathan Research Foundation, Chennai. He is the recipient of several Indian and international awards and prizes, most notably the Padma Vibhushan, the Ramon Magsaysay Award for Community Leadership (1971), the Albert Einstein World Science Award in 1986; the first World Food Prize in 1987; the Honda Prize of the Honda Foundation in 1991; the UNESCO Gandhi Gold Medal in 1999, and the Volvo Environment Prize, 1999. He is the second Indian to be chosen for the Indira Gandhi Prize for Peace, Disarmament and Development for the year 1999.

In 1989, Swaminathan founded the M.S. Swaminathan Research Foundation in Chennai. Here many of his ideas on a multi-pronged approach to poverty eradication are experimented upon through field projects. He leads a large and dedicated team of scientists and social researchers and is personally involved in each area of the Foundation's functioning.

This interview was given to **Parvathi Menon** in Pondicherry where Swaminathan had gone to attend an evaluation of the Biovillage project of the Foundation, an action plan envisaging the sustainable development of the land and water resources for improving the livelihood security of those communities which live in the 19 villages that come under the project. Here Swaminathan responds to a range of questions on the World Trade Agreement and its likely implications for India's agricultural and informal sectors; the sorts of initiatives that India and other developing countries can and must take in conferences such as the Seattle Round; the possible fall-out of the imposition of a regime of intellectual property rights for national and global diversity; the concerns that surround the issue of genetically modified organisms; and other related matters.

Excerpts from the interview:

► *In your Nehru Memorial lecture, one of the points you made was as follows. "Globalisation is creating new threats to the livelihood security of men and women living in poverty." Today the World Trade Organisation (WTO) has become the global forum where many issues relating to food security and the economic sovereignty of nations are being negotiated. Could you comment on the Seattle round and its implications for India and other developing nations in respect of these issues?*

Globalisation, indicating the removal of economic policies which protect the vulnerable sections of society, has certainly led to growing inequity between nations and within nations. The available data from the United Nations and World Bank sources show that in the last 20 years the global domestic economic product has grown from about $10 trillion in 1980 to over $30 trillion now, an increase of almost three times. This money has largely gone to about 12 to 13 countries, mostly industrialised. And in the poorer nations where some growth has taken place, most of the additional income has gone to the already well-to-do. Seven or eight years ago it was mentioned that one billion of the world's population was earning less than one dollar a day. Now this one billion has gone up to 1.3 billion. And according to the Asian Development Bank, one in three Asians is poor and lives below the poverty line, earning less than one dollar a day. Most of the poor, 900 million people, live in our part of the world, South Asia and South-East Asia.

Growth has not been even, and has been highly skewed in terms of countries and in terms of communities within the countries. There are other indications of the increasing marginalisation of the poor apart from their poverty status.

Why has this happened? Growth has not been even, and has been highly skewed in terms of countries and in terms of communities within the countries. There are other indications of the increasing marginalisation of the poor apart from their poverty status. Although the World Food Summit in 1996 called for the halving by 2015 of the numbers of men, women and children going to bed hungry, the Director-General of the FAO (Food and Agriculture Organisation) has said that the position has worsened in many countries since 1996.

As we approach a new century and millennium, we will have to think about how we can reverse the paradigm, to start with the poorest and make poverty elimination and hunger elimination the basic aim of all development. The other implication of globalisation and economic competition is the fact that large companies are swallowing up smaller companies. Efficiency is being measured in the industrialised countries and in the large multinationals in terms of the level of downsizing of the workforce. This is what the late Mahbub-ul-Haq called jobless economic growth, and that has caused much greater hardship to the poor.

► *What about the specific impact of the WTO for India and other developing countries?*

The WTO is five years old, and the Seattle Round is going to review what has happened. The World Trade Agreement (WTA) has a number of provisions, obviously to provide what is called a level playing field. For example, if the phasing out of subsidies has to be done by the industrialised countries in five years, developing countries can take ten years. But unfortunately, there is no level playing field in the world in terms of trade because one has to look at the enormous economic growth in the industrialised nations.

Take, for example, agriculture. You find even today in our country, paddy or rice drying is done on the roads in many parts of South India, Assam and so on. If you go to a North American or Australian farm, there is an enormous infrastructure investment that has been made through public funding in the last 50 years. I would say our investment in some of these areas like post-harvest technology is a minute fraction of what exists in these countries. National investment in rural development and rural infrastructure is generally going down, largely because of the debt servicing burden, the enormous cost of bureaucracy, the Pay Commission commitments and so on. There is hardly any money left

for development. As a result, where is the level playing field?

What is the purpose of trade, the ultimate human purpose of trade? I would say the world trade negotiations in Seattle should come to a mission statement on what trade is all about, what is it that we want to accomplish. If we all agree that trade has to be a very powerful mechanism to provide an opportunity for creating a productive life for every human being, then it takes a new meaning in terms of new rules and regulations. At the moment the countries of the European Community want to ensure that the high subsidies they are giving to their farmers are retained under some garb or the other. If you see the provisions for exemptions from the Aggregate Measure of Support (AMS), you will find that many areas, research and technology for example, have been exempted because they make a massive investment in frontier technologies like biotechnology and so on.

The developing countries have by and large been reactive and not proactive. The richer nations create the agenda, they prepare the first draft. Then you change a comma here and there, you have small victories, get something deleted or added. This is because we have not ourselves gone with a very clear agenda. The rich countries and those who draft the agenda will always have a fallback position. They take an extreme position and then say that they have given up so much. So I think the negotiations themselves have not been between equal partners.

K. PICHUMANI

▶ *Did India present an alternative agenda during the Uruguay round?*

We should have had a clear alternative from the time of the Uruguay negotiations, but many papers were just classified as secret, confidential and so on. There was no public debate, or public awareness, until suddenly one day the WTO came into existence and then everybody started looking at it. I think that India has not been guided by a commitment to poverty alleviation. Otherwise we would not be in this kind of position, where we have as many people below the poverty line as the entire population of India at the time of Independence.

▶ *Why do you think our government did not have the kind of commitment to use the WTO the way it should have?*

As I said, the initial drafts were all prepared by people from industrialised nations, the so-called experts, many of whom may have been well-known names in their fields. They see trade as a method of putting into practice the Darwinian hypothesis of the survival of the fittest. That is the very foundation of modern competitive trade. People who cannot compete will disappear. This is the problem. So the slate was their slate, it was a Western slate in which we dotted the i's.

▶ *Successive Indian governments have advanced the there-is-no-alternative argument as the reason for participation in the WTO on the terms set by the industrialised countries. Do you find this argument acceptable?*

If we did not become a member of the WTO we would have had to negotiate our terms of trade with each country separately and there we would always have been the loser; it is very difficult to negotiate with big powers. Therefore a multilateral mechanism with a dispute resolving mechanism is a much better one. Which is why China wants to enter the WTO; they know that being out of it is a disadvantage.

Somehow we did not develop a cogent public policy, develop a consensus among political parties, among different shades of opinion. Looking back I would say that if we had had an impact analysis on the poor as one of our policies, then we would have been in much better shape. Just as I am now saying that our Commerce Ministry's policy statement on import and export must have a livelihood impact statement. It has a sobering influence, because then you start looking at what is really going to happen. For example, if India begins importing so much of milk powder and puts milk powder on the OGL (open general licence) list, what is going to happen to the National Dairy Development Board's efforts which over a long period of time have led us to the first position in milk production in the world? Because ours are very small producers. This also holds true in many sectors – whether it is in the broad area of textiles which generates over 60 million jobs in this country, or the dairy sector which gives eight crore or 10 crore people in the rural areas additional livelihoods through ownership of a cow or a buffalo. Our production process by and large still falls under the small-scale sector and today poverty alleviation depends upon offering credit to small-scale industries.

Will the WTA consider micro-credit and micro-enterprise at all? In my view there must be a chapter, like TRIPS, in the Seattle Round on micro-entrerprises supported by micro-credit. That chapter should be prepared by us and given to them for their reaction. This would be supported by all South Asian countries, including China which also has enormous problems of providing livelihoods for each Chinese. As I said, one in every third Asian is poor. We should develop the first draft and give it to the rich countries for them to dot the i's. In a preambular statement you can quote their own words from the G-7 and G-8 resolutions on poverty, or the Copenhagen Summit, which has what is called an agreed text, or the World Food Conference, or the United Nations poverty reduction goal of 2015, and then say that if you want to achieve all this, the trade policy should be geared to ensuring the survival, not of the fittest, but of the weakest because we are trying to make them strong.

▶ *So you do think that there is negotiation space in the WTO for countries such as India?*

There is a lot of negotiation space, but that space has to be clearly defined, it has to be defined in ethical and human terms.

Regd No TN / MS (C) 750 / 99 LICENSED TO POST WITHOUT PREPAYMENT No TN / MS (C) / PP 130 & Regd No MH / MBI / SOUTH-461. Regd. WITH THE REGISTRAR OF NEWSPAPER FOR INDIA UNDER No.42591 / 84

You see, our large conglomerates of industries that dominate our economic policies are concerned with their own competitive ability – CII (Confederation of Indian Industry), FICCI (Federation of Indian Chambers of Commerce and Industry) or ASSOCHAM (Associated Chambers of Commerce and Industry). They look at their own self-interest, of course they have to be competitive. So they are the ones whom governments consult in such matters. They are concerned with trade and unfair competition in the automobile industry and so on. But how many are concerned with unfair competition that micro-enterprises supported by micro-credit face? That would be very high on the agenda if I were to have anything to do with the WTO because you can quote the resolutions on poverty alleviation supported by governments of rich nations, and say that if you are really serious, then this is what is needed.

► *What has been the level of India's preparedness for the Seattle Round? Do you have any comments on that?*

I think that the present Minister for Commerce, Mr. Murasoli Maran, has taken the right steps. He has tried to consult different people and political parties although the time available to him was very little.

In my view, we must define what are the four or five goals of trade. What is the principal mission statement of the WTO? Is it to produce a more equal opportunity world in which there will be a level playing field for the poor, and that trade should really become a means of promoting human security and happiness?

► *So your view is that India can swim against the tide in the WTO, we have negotiation space, we can protect our interests.*

We should look at the total picture. If we do, there is enough space. For example, if all South Asian governments have the same aim of poverty alleviation and hunger elimination, then we have a space there. We can join together and say that one of the potent tools of poverty alleviation is small-scale and decentralised enterprises that are environment-friendly and are supported by micro-credit. You may find that the richer nations may make some bargaining points but they will not be able to disagree unless they want to contradict the anti-poverty statements they made elsewhere.

One of the contemporary problems in terms of harmonising commitments made in different inter-governmental fora is the fact that different viewpoints are expressed in different U.N. fora. For example, member-governments of the FAO accept the concept of farmers' rights. Most governments, barring the U.S., have ratified the Convention on Biodiversity (CBD) which places heavy emphasis on ethics and equity in the sharing of benefits from genetic resources. The same is true in many other global fora and summits such as the Copenhagen Poverty summit, or the Beijing Women's conference. There is an overall commitment in these to the eradication of poverty, to fair play, to justice, to fair, and not free, trade. But all this finally gets operationalised at the forum of the WTO. So unless governments also take a similar stand in the WTO then whatever they have said in the other fora do not make sense, because the WTO forum is really the main pathway to which the other commitments can be operationalised.

► *How prepared do you think India is to protect its genetic reserves? How would you evaluate our* sui generis *legislation which has still not been passed in Parliament but which you have had some involvement in helping to draft?*

The CBD is the first major international legally binding convention which has principles of ethics and equity incorporated in it – of both gender equity, social equity and ethical principles in relation to exploitation of bio-resources. Since we ratified it we have not yet had a legislation to convert the principles of CBD into an effective legislative position. There are now two major legislation that need to be passed – one dealing with Intellectual Property Rights (IPRs) on plant varieties and farmers' rights, the other the Biodiversity Act. This should also include geographic appellations, because after the basmati patent it has become clear that we should also have some legislation to safeguard our unique products of various kinds.

We hope the present Parliament will provide high priority to providing a legal framework that is effective. For this it would also have to be realistic. For example, we should have a community gene management system from the bottom up. You can have at the State level a biodiversity board, then a national bio-diversity authority. The challenge in the Biodiversity Act is the question of management at three levels – conservation, sustainable use and equitable sharing of benefits. The last is the most important. These are community contributions. We must have legal methods of recognising and rewarding communities. In the draft I prepared on the Plant Variety Protection Act , I called it a community gene fund. The community should decide in what way they will use it.

Both these acts have undergone debate and discussion in the last five to six years. They should be such that they should not be used to harass legitimate researchers. We should not be of the view that it is only our material that is being exploited. If you take our major crops like wheat, maize, jowar, bajra, in fact all cereals except rice, everything came from outside. Take all our plantation crops – rubber, tea, coffee – nothing is our own. The world has benefited from an approach of give-and-take. Therefore, when we develop these legislation we should also not have the feeling that we are the only ones who are giving and not gaining. Unless we have strong South-South collaboration, we will find that many of our breeding projects like those for rice and wheat will be in difficulty. We should not have a siege mentality. Instead we should look upon our bio-resources from the angle of bio-prosperity, or rural prosperity.

► *Does our draft* sui generis *legislation reflect that?*

Well, I have not seen the final drafts. They will probably be placed in Parliament soon. We have been pleading that plant varieties protection and farmers' rights should be linked. If we do this, we will be the first country in the world where breeders rights and farmers' rights are linked as mutually reinforcing. I think that some provisions have not really been understood, like the Community Gene Fund. If we have national commitment, we must have a one per cent cess on agricultural commodities that should be credited to the Community Gene Fund. That should go towards revitalising and rewarding the conservation traditions and ethics of tribal and rural families, the large invisible unrecognised community conservation process. Look at the very poor parts of Orissa. We have got a database on their contributions towards conservation of plant species. It is very moving, as the very poor are not working for recognition or reward. But it is people such as these who have saved the food security system of the world, and we must realise it.

So I think we should really use our *sui generis* system for achieving the triple purpose of promoting conservation, making it a people's movement; ensuring its sustainable use with participatory breeding programmes done with farming families; and ensuring equity and ethics in benefit sharing. Those behind the large unrecognised community conservation efforts

must be recognised, given social prestige and economic rewards.

▶ *What are your views on the ethics of patenting of life forms? Could a global consensus be built up against this?*

As a rule patenting of life forms is unethical. But the distinction was made by the Supreme Court in the *Diamond vs Chakravarti* case by saying that where something is a completely novel creation by human ingenuity, it can be patented. For example, you should not patent the human genome sequences because all that you are doing is studying something with the help of sophisticated technologies. You can 'discover' a new plant species and name it after yourself, that is not an invention. Invention is the product of the human brain, where something never existed but because of your effort it happened. Well, I think inventive people must be rewarded because that is how the world progresses. There is nothing wrong in honouring invention. But we must see to it that there are some international ground rules in this whole rush for patents on all kinds of things. In all patent regulation there must be a provision for compulsory licensing of rights. Suppose I discover a new rice variety which is resistant to a particular disease, it should be available to everybody, poor or rich, not only to those who can pay.

▶ *On TRIPS, in the Seattle Round, what do you think of India's position?*

India had already taken a position on a number of issues. On trade liberalisation, access to markets. But on the fundamental issues of TRIPS, I think India's position should be that we should try to promote a *sui generis* system that contains recognition and reward to farmers' rights. But we must develop a consensus among other countries also, because you must have a critical mass of countries which have the same viewpoint. So during this process we must have a national stand, a regional stand among those countries which have a high degree of poverty, like Africa, India, Latin America. There is no use pretending that we are all well off. Thirdly, I think we must insist that there is some harmonisation in global negotiation, particularly in terms of ethics and equity. We should insist on benefit-sharing, access, prior informed consent, and so on. We must move to make UPOV, the Union for the Protection of Plant Varieties, a Union for the Protection of Breeders' and Farmers' Rights. So in this way you must set the ball rolling towards a more equitable world in the new century.

"We have over 106 million farm families in the country, the largest free enterprise segment. It is important that they have choices, that they can keep their seeds, they can sell their seeds in the neighbourhood and so on. If all this is destroyed you can call it genetic enslavement."

▶ *Without this pro-poor lobby in the WTO do you think its decisions will have an adverse impact on agriculture and livelihood security?*

It will continue to have adverse implications. I have already said that importing pulses and oilseeds, as India is doing, is a measure of the neglect of dry-land farming. What are the crops of dry-land farmers? The most important are pulses and oilseeds.

In agriculture there have been two major questions. One is market access to other countries. The hope was that if the European Union and North America really reduce subsidies to their farmers, then we will have a comparative advantage. The other aspect is the quantitative restrictions. So far we find that market access has not happened. Protectionism and subsidies are very high, and now they have introduced non-tariff barriers, forms of protections like environmental concerns, pesticidal residues or even social concerns like child labour. So how far we are going to have free market access is one question. Of course we are also not really geared to compete in a big way as our post-harvest technology is poor as are our sanitary and phyto-sanitary measures. So we must make a major investment here if we are going to have a competitive advantage in terms of exports. At the same time, the industrialised countries should really improve market access and provide a level playing field by reducing subsidies.

The second aspect of quantitative restrictions is the one where we have to be very careful. If foods like pulses and oilseeds are imported indiscriminately it can kill incentives for the improvement of our dry-farming areas. So we should be careful in importing commodities that will destroy livelihoods of the poor. There should be a consensus on this, and as I said, a separate chapter or section in the revised WTA should be put which deals with trade and poverty alleviation, trade as an instrument of poverty alleviation.

▶ *You have warned about the possibility of India's 'genetic enslavement'.*

When I use the word genetic enslavement it means two things. One is to have very few options – large areas being covered by one particular strain, which ties the farmer to the company. The second include techniques like Terminator. The companies call this genetic-use restriction, which means the farmer will have to buy from them every year. That will certainly lead to the farmer's own control over his agricultural destiny being destroyed. We have over 106 million farm families in the country, the largest free enterprise segment. It is important that they have choices, that they can keep their seeds, they can sell their seeds in the neighbourhood and so on. If all this is destroyed you can call it genetic enslavement.

▶ *What are your concerns on genetically modified organisms (GMOs)?*

These concerns are now universal. There are those of an environmental nature; for example, the creation of super weeds, or the studies on the monarch butterfly, which suggest harmful effects from pollen containing the BT toxin. Also, in human beings, we do not know the kind of hay fever that may spread with new kinds of pollen. Similarly there is the food safety aspect, arising from the use of antibiotic markers in genetic engineering; when you really need them you would have developed a resistance to them. Then there are ethical issues such as the one involving the Terminator. So we have food safety concerns, we have environmental concerns, we have the whole area of ethical concerns. All these come under the blanket cover of bio-safety. Under the CBD, there should be an internationally agreed protocol on bio-safety which addresses these issues. I have always felt that there should be a broad-based National Commission on Genetic Modification for Food and Health Security to look at bio-safety issues in India.

▶ *Do you think there should be a moratorium on GMOs?*

Moratorium not in terms of research but in terms of the commercialisation of GMOs. I would say that there is no harm in waiting for a few years until the clinical, nutritional, medical and environmental trials, the ethical guidelines, are complete.■

■ GOVERNMENT

A RUSH OF BILLS

The NDA Government rushes through with a slew of legislative measures.

SUDHA MAHALINGAM
in New Delhi

WITH the preliminaries over in the previous session, the winter session of the 13th Lok Sabha began on November 29 intent on doing serious legislative business. Emboldened by the greater security of numbers it enjoys in the Lok Sabha, the National Democratic Alliance (NDA) Government was in a tearing hurry to push through laws that are likely to change the course of the country's economy as well as polity.

Eager to prove its reformist credentials to the international community in order to win its approval, the Government has speeded up the process of economic reforms, a sector which the Congress(I) has trodden with caution.

In the truncated first session, the Government had set the ambitious legislative agenda rolling with the introduction of three bills with major ramifications – the Insurance Regulatory and Development Authority (IRDA) Bill, the Prevention of Money Laundering Bill (PMLB) and the Securities Contracts (Regulation) Amendment Bill. The session ended without a debate on the legislative proposals. On the first day of the winter session, four more bills, all of economic importance, were tabled. They are: the IRDA Bill, the Foreign Exchange Management (FEMA) Bill, the Mines and Minerals (Regulation and Development) Amendment Bill and an amendment to the Securities Contracts Bill. The strategy of burdening the House within a short span with a slew of legislation, which require expert inputs for the conduct of any meaningful debate, appears to have paid off. The House passed four of the bills in the first week itself without any meaningful debate. In fact, the controversial FEMA Bill and the ineffectual PMLB were taken up and adopted on December 3, at the fag end of the week when several MPs were leaving for their respective constituencies. In fact, the House barely had a quorum. What better moment to put the bills to vote and get them passed?

With more bills on the anvil, the floodgates would be opened for the introduction of a clutch of World Trade Organisation (WTO)-ordained bills, which are under various stages of preparation. The current Lok Sabha will perhaps be remembered as the fastest law-maker in Indian legislative history.

The Congress(I), the main Opposition party with a majority in the Upper House, had initially made a song and dance about the IRDA Bill and kept the Government on tenterhooks over whether the legislation would get its support. In fact, it hardly had any ideological differences with the Government on this issue, having authored the initial phase of the reforms in the first place. Not unexpectedly, it finally decided to play ball, but only after proving a point. It premised its support to the bills on certain changes that it wanted incorporated in the IRDA Bill. The Bill, which throws open the insurance sector to private and foreign investors, was passed after incorporating the amendments prescribed by the Congress(I), despite stiff opposition from the Left parties and the insurance employees. A smirking Congress(I) now sees itself as the patron critic of the reforms process.

The IRDA Bill was rushed through hastily even as Roopchand Pal of the Communist Party of India (Marxist), who is a member of the Parliamentary Standing Committee on Finance, demanded the setting up of a Petitions Committee to discuss a petition signed by 1.5 crore persons against the passage of the Bill in its current form. This merely indicated the Government's cavalier attitude to popular sentiment. Deputy Speaker P.M. Sayeed did not consider it necessary to wait for the setting up of the Petitions Committee before the Bill was taken up for discussion and adoption. Vayalar Ravi of the Congress(I) urged Sonia Gandhi not to allow the passage of the Bill, but the Congress(I) had other plans.

The amendments make it mandatory for all insurance companies to invest a portion of their funds in the social and infrastructural sectors. The Congress(I) had originally sought a commitment on 75 per cent of the insurers' investible funds in these sectors. But the Government has left it to the Regulatory Authority to specify the quantum. A clause suggested by the Congress(I) that failure to comply with specified provisions be made punishable with penalties of up to Rs.25 lakh and even cancellation of licence

SHANKER CHAKRAVARTY

Prime Minister A.B. Vajpayee with Parliamentary Affairs Minister Pramod Mahajan outside Parliament House on the opening day of the winter session.

A large contingent

V.VENKATESAN

PRIME Minister A.B. Vajpayee's Council of Ministers is the largest ever for a Union Government. Yet, at 74 it falls short of the size recommended by the Administrative Reforms Commission in the 1960s – 11 per cent of the combined strength of the two Houses of Parliament.

When a 70-member Ministry was sworn in on October 13, it was assumed that Vajpayee wanted to have as big a Council of Ministers as possible in order to avoid pressures for further expansion. But when he inducted three Cabinet Ministers and one Minister of State with independent charge on November 22, apart from effecting a minor reshuffle, it was dictated by corrective as well as electoral factors.

The inclusion of Shukhdev Singh Dhindsa, the Akali Dal Rajya Sabha member, as Minister for Works and Estates, was dictated by the compulsions of coalition chemistry. The absence of representation to the Sikh community in the Ministry had irked the Akali Dal, a key ally of the Bharatiya Janata Party. The Akali Dal had won two Lok Sabha seats. Its entry into the Ministry was out of question as it did not have the minimum of six sears needed to claim a berth. The party missed the "chemistry" quota too owing to bickerings among its senior leaders about who should get a berth. Dhindsa's inclusion, which followed a process of reconciliation within the party leadership, was a corrective step, taken in order to assuage the feelings of the party and Sikhs in general.

The inclusion of Rajnath Singh, Rajya Sabha member and Uttar Pradesh BJP president, as the Cabinet Minister in charge of Surface Transport, was a foregone conclusion. The BJP wanted to reward him for having accepted the high command's nominee, Ram Prakash Gupta, as Chief Minister. Rajnath Singh had projected himself as the candidate for chief ministership in the place of Kalyan Singh. Another factor behind Rajnath Singh's entry into the Cabinet is the long-time grievance of the forward community of the State of neglect shown towards it during the tenure of Kalyan Singh. As part of a post-Kalyan Singh package, Rajnath Singh's induction was also a corrective measure. Nitish Kumar, who was earlier allotted the Surface Transport portfolio, has got Agriculture.

The inclusion of C.P. Thakur, the BJP MP from Patna who is a Bhumihar, was also done with a view to correcting a perceived imbalance in the representation of various castes from Bihar. Bihar, which has the largest contingent in the Ministry, has been showered with favours in view of the coming Assembly elections. C.P. Thakur is the Cabinet Minister for Water Resources.

The BJP's Rajya Sabha MP, Arun Shourie, is now Minister of State for Planning, Statistics and Programme Implementation. He will also be in charge of the Department of Administrative Reforms and Public Grievances in the Ministry of Personnel, Public Grievances and Pensions, which is headed by the Prime Minister. Shourie seems to have been deliberately kept out of Personnel, considering his past crusade against corruption. The Department of Personnel has under it the Central Bureau of Investigation (CBI). The Home Ministry has a role only in the case of Indian Police Service (IPS) officers. Vasundhara Raje assists the Prime Minister in the Department of Personnel and Training. Shourie had a major role in drafting the party's manifesto, and his induction from the BJP's quota is a sign that the party wants to be seen as recognising talent.

In addition to the Parliamentary Affairs portfolio, Pramod Mahajan has been allotted the newly formed Ministry of Information Technology, the relevance of which is being widely debated in industry circles (article on page 86). Satyanarayan Jatia is the new Labour Minister.

Minor changes have been effected in the portfolios of six Ministers of State. Significant among them is the shifting of Bangaru Laxman from Planning and Implementation to Railways. Mamata Banerjee, the Railway Minister, now has two Ministers of State in her Ministry. This has caused her disappointment, although she denied that she had expressed unhappiness over the reshuffle.

The allocation of portfolios suggests a deliberate move to have at least one BJP Minister of State in the Ministries headed by the alliance parties. ■

granted to the insurer in case of persistent failures, has been included in the Bill. Another amendment provides for preferential registration of those companies which seek to provide health insurance cover to individuals and groups of individuals as part of their life and general insurance policies. The Government also conceded the Congress(I)'s demand that the private companies offer insurance cover to backward, rural and the unorganised sectors. This would include crop insurance policies.

EMPLOYEES of the insurance sector staged a protest outside Parliament House. The All-India Insurance Employees' Association condemned "the haste with which the Government is proceeding towards the enactment of the IRDA Bill, 1999, despite allround opposition." Class II, III and IV employees of the Life Insurance Corporation of India and the General Insurance Corporation went on a day's strike on December 1 to protest against the adoption of the Bill. The Left parties, which believe that the passage of the Bill amounts to the betrayal of the working class, will oppose its passage in the Rajya Sabha.

However, it is possible that the IRDA Bill will have to return to the Lok Sabha for consideration of certain embarrassing clauses that have crept into the document. The Bill allows insurance companies to invest 25 per cent of their funds in securities of the Government of the United Kingdom or those guaranteed by that Government. This fact came to light when the Bill was taken up for discussion in the Rajya Sabha.

THE PMLB and FEMA constitute a composite piece of legislation. If FEMA is passed by the Rajya Sabha, for the first time in independent India, violations relating to foreign exchange will be treated as civil offences. Despite Finance Minister Yashwant Sinha's assurances that capital account convertibility will not be allowed, experts feel that the loopholes in the Bill will result in large-scale flight of capital. One glaring loophole in the Bill is the arithmetical definition of a resident Indian. Anyone who has resided for more than 182 days in the course of the previous financial year alone will be reckoned

Regd No TN MS (C) 750/99 LICENSED TO POST WITHOUT PREPAYMENT No TN/MS (C)/PP 130 & Regd No MH/MBI/SOUTH-461 Regd WITH THE REGISTRAR OF NEWSPAPER FOR INDIA UNDER No 42591/84

as a resident Indian for purposes of liability under FEMA Under its predecessor, the Foreign Exchange Regulation Act (FERA) no arithmetical formula was applied to determine a person's resident status FERA was more concerned with the nature of activities he or she was engaged in while abroad and his or her intention determined liability While FEMA may remove any discretion that the agency investigating the violations may have had in determining a person's culpability, it also makes it possible for anyone intending to violate FEMA to remain abroad for over 182 days during the course of a financial year in order to escape the provision of the law

Sections 6(4) and 9(d) of FEMA, which define the circumstances under which a resident Indian can hold own, transfer or invest in foreign currency, foreign security or immovable property abroad appear to have been designed specifically to shield certain persons currently being investigated for FERA violations Section 15, which allows compounding offences, further weakens an already weak law But the most controversial provision in the Bill is Section 40 which gives the Government the power to suspend or relax the operation of any or all provisions of the Act This is a blatant authorisation of governmental intervention in investigations and is unprecedented Finally, Section 49 (3) sets a time-frame of two years from the commencement of the Act for the completion of all ongoing investigations under FERA Is this time-limit realistic for investigating transnational crimes involving protracted procedures, not to mention banking secrecy laws in many parts of the world?

Employees of the insurance sector protesting against the Insurance Regulatory and Development Authority Bill in New Delhi.

THE Mines and Minerals (Regulation & Development) Amendment Bill, 1999 seeks to effect three changes First, it proposes to delegate to the States certain powers hitherto exercised by the Centre Based on the recommendations made by the B B Tandon Committee in December 1996, the Bill proposes to authorise State governments to grant and renew prospecting licences and mining leases for those minerals listed in schedules A and B The Bill seeks to confer full powers to the State governments for grant of mineral concessions in respect of limestone It seeks to review existing laws and procedures governing the regulation and development of minerals in order to make them more compatible with changed policies It also seeks to check illegal mining The Bill contains the new concept of reconnaissance operations' Reconnaissance as a stage distinct from prospecting operations has been included in the Bill and a person or company can apply for a reconnaissance permit for a total area of 10,000 square kilometres The statement of objectives and reasons appended to the Bill states that this will facilitate investments through the deployment of state-of-the-art exploration technologies and accelerate exploration of mineral resources The moot question is whether this is consistent with national security The Bill generated some debate with Left party MPs opposing some of the provisions. It is yet to be passed

The Lok Sabha also passed the amendment to the Securities Bill seeking to allow derivatives trading Two more amendments to the Securities Laws Bill were also tabled The amendments seek to regulate the business of dealing in securities, to promote the development of the securities market and to provide for regulation of depositories in securities

The WTO-related bills that are being drafted include the Patents Amendment Bill, the Bill to amend Copyrights, the Plant Varieties and Farmers Rights Protection Bill, the Designs Bill, the Geographic Indications Bill and the Cyber Laws Bill If the Government manages to push all these bills through in the winter session as it well might it might even attempt to do the same with the Central Vigilance Commission Bill and the Women's Bill

IN an important development a BJP MP has introduced a private member's Bill to amend the Constitution to bar persons of foreign origin from holding the offices of President, Vice-president and Prime Minister Introduced by Kirit Somiaya, after prolonged wrangles, it is widely seen as an attempt to target Congress(I) president Sonia Gandhi It drew protests from Congress(I) members who argued that Parliament did not have the legislative competence to consider a Bill that amounts to altering the basic structure of the Constitution They argued that the Bill sought to make a distinction between "natural born' citizens and those who acquired citizenship and therefore sought to tinker with the structure of the Constitution

The Congress(I) members objected to the Bill also on the ground that it had not been cleared by the committee on private members' bills Prime Minister A B Vajpayee, for his part, said that the issue of "foreign origin" formed part of the NDA's manifesto and that every member had a right to introduce any legislation on any issue

The NDA Government is not likely to be take up the Small States Bill, which would have enabled the formation of Vananchal, Uttarakand and Chattisgarh States The introduction of this Bill is being resisted by the Telugu Desam Party (TDP). The rumblings within Andhra Pradesh for a separate Telengana State is behind the TDP's stand. ■

A party adrift

The Congress(I) leadership's recent actions and also inaction on various crucial issues, point to rank confusion.

VENKITESH RAMAKRISHNAN
in New Delhi

THE political pantomime in Orissa over the issue of replacing Chief Minister Giridhar Gamang has indeed been a reflection of the current state of affairs in the Congress(I). Hit very badly by a cyclone, what Orissa needed was concerted relief efforts by the government besides those by social and political organisations. But at that very moment, the primary concern of the ruling party, the Congress(I), seemed to be inner-party power struggles. On the one side, former Chief Minister J.B. Patnaik and Basanth Biswal, a Minister in Gamang's Cabinet, were trying to overthrow the Chief Minister, while on the other, Gamang was trying his best to hang on to the Chief Minister's post. Worse still, the central leadership, under party president Sonia Gandhi, became enmeshed in this inopportune political game instead of making efforts to set things in order.

Almost all the moves made by the Congress(I) since the beginning of the winter session in Parliament have been characterised by an absence of positive political direction or purpose. The party leadership appeared to be flitting from one organisational and political initiative to another without actualising any of them. And the result is rank confusion.

THE party leadership began its preparations for the winter session based on the premise that it had to advance its struggle on the demand to delete former Congress(I) Prime Minister Rajiv Gandhi's name from the charge-sheet filed by the Central Bureau of Investigation in the long-running Bofors pay-offs case. The party was under the impression that it had made gains on this front during the previous session of Parliament, on account of the statement made by Home Minister L.K. Advani on the floor of the Lok Sabha during the debate on the motion of thanks to the President's address. Advani had said that he could "understand Sonia Gandhi's sentiments and feelings on the issue" and that "the government was considering all aspects relating to the inclusion of Rajiv Gandhi's name in the Bofors charge-sheet". The Congress(I) saw this as a positive gesture, and believed that it needed to take this gesture to its "logical conclusion". It hoped to put to use its numerical strength in the Rajya Sabha as also the Bharatiya Janata Party-led Government's eagerness to complete its "second-generation economic reforms", in pushing its own case.

The Congress(I) was aware that the Government needed its support to pass its bills in the Rajya Sabha, starting with the Insurance Regulatory and Development Authority (IRDA) Bill. Leaders such as Pranab Kumar Mukherjee had been indicating that the Congress(I)'s support would not be forthcoming if the Government failed to act suitably on the matter of the Bofors case charge-sheet. In fact, observers believe that this was the real reason behind the conciliatory-sounding statement made by Advani in Parliament.

However, the Congress(I)'s hopes of exerting pressure on the Government on the basis of its support for the pro-reform measures fell flat on the first day of the

SHANKER CHAKRAVARTY

Congress(I) president Sonia Gandhi with Prime Minister A.B. Vajpayee.

Regd No TN / MS (C) 750 / 99 LICENSED TO POST WITHOUT PREPAYMENT No TN / MS (C) / PP 130 & Regd No MH / MBI / SOUTH 461 Regd WITH THE REGISTRAR OF NEWSPAPER FOR INDIA UNDER No 42591 / 84

Congress(I) president Sonia Gandhi receiving the AICC introspection Committee Report from committee chairman A.K. Antony in New Delhi on November 30.

winter session. Making it clear that the Government had no intention of following up on the "conciliatory gesture", Advani told the Lok Sabha that any move to delete Rajiv Gandhi's name from the charge-sheet would amount to interference in the CBI probe. He said that the Government had sought the opinion of the Attorney-General on whether it was permissible to seek to delete a name from the charge-sheet, and whether any proceedings should be initiated under Section 321 of the Criminal Procedure Code for this. Advani said that the Attorney-General had stated that Section 321 of the CrPC – which empowers the Government to proceed for withdrawal of prosecution – was not applicable in this case because the process of framing the charges and launching prosecution had not been initiated. The same day, Prime Minister A.B. Vajpayee said that the provisions of the relevant laws did not favour the deletion of the late Prime Minister's name.

Under these circumstances, what remained to be seen was whether the Congress(I) would go through with its threat of not cooperating with the Government on the legislative business. In the next four days it became clear that it was only an empty threat. On December 1, the Congress(I) supported the IRDA Bill in the Lok Sabha, even as the Left parties and the Samajwadi Party (S.P.) and the Rashtriya Janata Dal (RJD) registered their opposition and staged a walk-out.

The Congress(I)'s only consolation was that the Government adopted four amendments moved by it, including a social obligation clause that would bind insurers to invest in social and infrastructural sectors, and a penalty provision to deal with defaulters. Clearly, it was the Congress(I), rather than the BJP-led Government that got the wrong end of the stick *vis-a-vis* the pro-reform bill.

Three streams of opinion had clashed within the Congress(I) on this issue before the pro-reform lobby prevailed, compelling the Congress(I) to support the Government. Broadly, Jairam Ramesh, Manmohan Singh and Vayalar Ravi represented the three streams. When Manmohan Singh, who put the economic reforms process in place, advocated "reforms with a human face" that would, with its pro-poor slant, focus on issues such as primary health care and education, Jairam Ramesh pointed out that pro-poor policies have to be in tune with the larger liberalisation framework and cannot be pursued just to gain populist support. Vayalar Ravi and Congress Working Committee (CWC) members such as Rajesh Pilot and A.K. Antony were of the view that the reforms process has to be reviewed in terms of the Congress(I)'s original policies that laid greater emphasis on building an egalitarian society. Manmohan Singh's contention on the IRDA Bill was that the Congress(I) should introduce amendments such as the social obligation clause, a proposal that was supported by leaders such as Madhavrao Scindia. The opposition by Ravi, Pilot and others to the basic approach of the IRDA Bill was brushed aside on the strength of the majority view – a combination of Manmohan Singh's and Jairam Ramesh's perceptions. Consequently, the Congress(I) cooperated with the Government despite the fact that it failed to get the expected results with regard to the Bofors case charge-sheet.

THE Congress(I) suffered yet another reverse when the party's government in Goa, which had come to power in June with a clear majority, collapsed (story on page 52). The collapse highlighted the lack of coordination between the party's central leadership and its State units. Sonia Gandhi continued to maintain that the Congress(I) government would stay in power – even as a non-Congress(I) Ministry was being formed! The party president was obviously unaware of the dynamics within the State unit.

THIS trend of confusion continued on the organisational front too, even as the party completed the process of analysing the reasons behind the reverses it suffered in the Lok Sabha elections. A 200-page report was submitted by an 11-member committee led by A.K. Antony and comprising leaders such as Mani Shankar Aiyar, P.M. Sayeed, Motilal Vora and Priya Ranjan Das Munshi. The committee made 20 sets of recommendations on improving the party set-up in terms of organisational structure and inner-party discipline and its image. The report has apparently recommended action at both national and State levels. However, the leadership, especially party president Sonia Gandhi, has not moved to implement the recommendations. The official explanation is that the CWC has to study the report in detail before any step is taken. But party insiders say that the leadership is apprehensive about rubbing the power lobbies in different States the wrong way.

According to them, although the committee has gone into the party's failings in detail, it has not acknowledged one important point raised by many of the respondents – Sonia Gandhi's foreign origin. Although many respondents are believed to have said that it was a major handicap in the election campaign, the committee glossed over it. The views expressed are, however, reported to have been incorporated in the report as an appendix. Given the fact that an important body like the introspection committee has indulged in cloak-and-dagger tactics, there are doubts in the party over

the success of any organisational and political restructuring exercise.

The constitution of a few more committees under the leadership of senior leaders to look into various aspects of organisational restructuring, as was done after the 1998 Lok Sabha polls, is on the cards. It is another matter that the recommendations made by the committees set up in 1998 are yet to be implemented and the bodies themselves are increasingly being perceived as vehicles of indecision and procrastination.

THE Orissa episode brought to the fore the same malady. In the absence of a purposeful central leadership, the party's State-level leaders are stooping to new lows in their efforts to retain their hold over party and governmental positions and widen their ranks. Gamang and the dissident leaders accused each other of wanting to pocket the relief funds from international sources.

Another aspect that became clear as the game of oneupmanship progressed was that the balance of power among various groups in the party is such that the process of selecting a successor is difficult. The most powerful group that opposed Gamang was led by J.B. Patnaik. However, the numbers in the CLP being what they are, Patnaik cannot think of returning as Chief Minister without the support of the Hemanth Biswal group. The Biswal group, on its part, was trying to use this to project its own leader as an alternative candidate for the chief ministership. The central leadership's inability to take a tough decision and force the issue became obvious when a team led by CWC member Madhavrao Scindia and comprising leaders such as Vayalar Ravi, returned from Bhubaneswar twice without finding a solution.

IN the final analysis, these goings on have only contributed to strengthening the perception that Sonia Gandhi does not really have it in her when it comes to leadership capabilities. More and more middle and junior level leaders have begun to express their dismay over the way the party is being run. Whether this will snowball into a major inner-party movement, and if this happens, who will lead that movement, are two questions doing the rounds.

It is clear that the party cannot hope to advance its political ambitions until certain corrective measures are taken either under Sonia Gandhi's leadership or outside of it. ■

POLITICS

Familial conflicts

Their merger plans gone awry, the Janata Dal (United), the Samata Party and the Lok Shakti struggle to stay afloat as a combine.

T.K. RAJALAKSHMI
in New Delhi

LOK SHAKTI leader Ramakrishna Hegde's exclusion from the second round of appointments in the Union Cabinet on November 22 is an early sign of imminent discord within the Bharatiya Janata Party-led National Democratic Alliance (NDA) government. It also shows that all is not well in the much heralded "Janata parivar".

Except in the upper echelons of the Samata Party, it was generally assumed that the Cabinet expansion would provide a pretext to accommodate Hegde. Prior to the expansion, Hegde was known to have met Prime Minister Atal Behari Vajpayee twice. Other meetings with senior functionaries of the "Janata parivar" had appeared almost to guarantee the disgruntled Hegde, who was looking to be mollified with a significant elevation, a Cabinet berth. As it happened, all the speculation was unfounded.

The turn of events will prove a setback to the proposed merger of the Lok Shakti with the Samata Party and the Janata Dal (United). Any friction within the Janata parivar could in turn seriously impair relations among its various constituents and the BJP. Given that the BJP-JD(U) alliance was forged in Karnataka amidst hostility from the State BJP unit, it seemed only a matter of time before the euphoria of the NDA's election victory would wear off.

Protesting loudly over his exclusion, Hegde lay the blame squarely on Defence Minister George Fernandes, who is also the leader of the JD(U) Parliamentary Party. The Lok Shakti unit in Delhi held a protest demonstration outside Fernandes' residence, accusing him of "stabbing Hegde in the back". The Samata Party said that the decision to keep Hegde out was taken jointly with the JD(U).

Meanwhile, Union Minister for Civil Aviation Sharad Yadav left no stone unturned to bring about a rapprochement between the Samata Party and the Lok Shakti. He met Hegde more than once in a bid to mollify him, but with little success. A close aide of Sharad Yadav's told *Frontline* that overcoming mutual resentment was proving difficult.

On October 30, the JD(U) steering committee met in the absence of Fernandes and adopted a resolution that stated that the "failure to consult and communicate with Mr. Hegde is an alarming lapse that casts serious doubts on the future functioning" of the NDA. Articulating its position, the Lok Shakti said: "It has not enhanced the image of the new government. It has created a crisis of confidence." The NDA was reminded of its commitment to "sincere and genuine consensus" among all its constituents.

Holding out the promise of an alliance-in-the-making, Sharad Yadav, Fernandes, Hegde, Paswan and J.H. Patel had shared a podium at a "unity" rally in Bangalore on August 7. The "socialist bloc" within the NDA seemed to seek a greater salience in the affairs of the ruling coalition. The election results, however, drove a wedge in its plans. The reunified Janata Dal suffered a drubbing in Karnataka, though its robust performance in Bihar partly redeemed its position. Hegde was largely held responsible for the setback in Karnataka, though he was not given credit for the outcome in Bihar.

Differences cropped up among the three Janata Dal splinter groupings soon after the first list of Cabinet Ministers was announced on October 13. JD(U) leaders Sharad Yadav and Ram Vilas Paswan – newcomers to the NDA – earned important Cabinet positions, while Hegde, an older ally, was left out. In apportioning the limited quota of Cabinet berths available to it, the Janata parivar faced a thorny problem. It was important to maximise the representation from Bihar, in order to boost the chances of the alliance in the March 2000 Assembly elections. Sharad Yadav and Ram Vilas Paswan earned their positions by virtue of this calculation and Hegde was eliminated on account of the

V. SUDERSHAN

From left, Ramakrishna Hegde, Sharad Yadav, J.H. Patel, George Fernandes and Nitish Kumar at a press conference in New Delhi in July 1999.

fact that Karnataka had lost its priority after the elections.

It has become politically expedient for the NDA to give importance to the leaders from Bihar, especially Sharad Yadav who defeated Rashtriya Janata Dal (RJD) president Laloo Prasad Yadav in Madhepura.

Samata Party sources said that the choice of ministerial candidates was made collectively, keeping in mind the coming Bihar Assembly elections and the ground reality of the Lok Shakti's poor performance in the Lok Sabha and Assembly elections in Karnataka. The final decision rested with the Prime Minister, he added.

Referring to Hegde's protests, a Samata Party leader said: "He should have shown statesmanship by not making an issue of his exclusion but rather contributed in helping out with the coming Bihar elections." As far as the Samata Party was concerned, Karnataka was a closed chapter while Bihar was "yet to come". The leader said: "The fact is that the Lok Shakti exists only in Karnataka. The Samata Party is a political force in Bihar and exists in Manipur as well." Making an oblique reference to the JD(U), he added: "But for us, Laloo Yadav could not have been defeated and our party people want that fact to be acknowledged. We would also not like someone else to take credit for our sacrifices."

It is not clear whether or not Fernandes played a role in denying Hegde a ministership. Though originally from Karnataka, Fernandes' political fortunes today are inextricably tied up with Bihar. He may have felt inclined to plead on behalf of Sharad Yadav and Ram Vilas Paswan and sacrifice Hegde's interests. Moreover, as the vote percentage of the alliance between Laloo Prasad Yadav's Rashtriya Janata Dal and the Congress(I) had gone up in the Lok Sabha elections, he had a strong incentive to ensure that the Janata parivar in Bihar remained united. Moreover, Samata Party leader Nitish Kumar had won the election by a narrow margin.

The Assembly elections in Bihar would put pressure on the parties of the Janata parivar to accelerate their merger process and project a degree of credibility as a political force within the NDA. During a visit to Patna recently, Ram Vilas Paswan gave expression to these sentiments. The delay in formalising the merger, he said, "sent wrong signals to the people". "I fail to understand the reasons for the delay when we contested the Lok Sabha poll on a common symbol and reaped a rich electoral harvest in Bihar," he added.

The names of two or more chief ministerial aspirants from the Janata parivar are doing the rounds in Bihar, Paswan and Nitish Kumar being among them. Rumblings over seat-sharing among the BJP, the JD(U) and the Samata Party have begun, with some sections going public with their demands.

Matters are not helped by the tenuous character of relations between the Bihar units of the Samata Party and the JD(U). The induction of an RJD leader, former Union Minister Ram Lakhan Singh Yadav, in the JD(U) also put a spoke in the wheel. Not only did this displease the JD(U) unit in Bihar, the Samata Party unit expressed reservations over what it called a "unilateral decision" by JD(U) president Sharad Yadav. There had been some heartburn in the Samata Party when a senior leader from Uttar Pradesh, K.C. Tyagi, joined the JD(U) earlier. Despite their pivotal role in the Bihar elections, party workers felt that they were being taken for granted by Sharad Yadav.

However, according to Samata Party sources, the "crisis of confidence" cannot be resolved merely by allocating a ministerial berth to Hegde. Sections close to Fernandes in the Samata Party say that a merger makes little difference to the situation on the ground, as elections were fought along with the JD(U) and the Lok Shakti on a common symbol, the arrow, and can be fought again for the Bihar Assembly elections. Samata Party general secretary Jaya Jaitly said: "Ideologically, we are on the same plane regarding social justice and corruption in Bihar. It would have been better if we were a larger, cohesive group to avoid uncertainties and splits."

Organisational details remain to be worked out, including a decision who will be the president of the unified party. The party symbol also remains to be decided by the Election Commission. The merger may be further delayed if seat-sharing arrangements in Bihar run into rough weather. But as the three parties represent different caste banks, it is in their self-interest to maintain their opportunistic alliance until at least the next round of elections. ■

Axe on autonomy

In its pursuit of a sectarian agenda, the BJP-led Government decides to retire two perceived ideological opponents from the Prasar Bharati board.

SUKUMAR MURALIDHARAN
in New Delhi

WHATEVER its underlying rationale, the Government's decision "retiring" two members of the Prasar Bharati board on November 22 showed a shrewd appreciation of infirmities in the law. The matter of propriety though, is something else, since the two individuals concerned – historian Romila Thapar and Hindi litterateur Rajendra Yadav – have been zealous in guarding the Prasar Bharati mandate against dilution. It was an attitude that meant almost axiomatically that they were the most liable to run into conflict with the Bharatiya Janata Party (BJP), never known to be overly scrupulous in its regard for the integrity of autonomous institutions.

Rationalising the Government's action, Arun Jaitley, Minister of State for Information and Broadcasting, resorted to certain curious locutions. His initial justification was that the electronic media needed a dose of professionalism – a mission to which the talents of a historian and a literary figure were supposedly superfluous. On closer interrogation about the political motivations underlying the retirement of two known critics of the BJP style of politics, Jaitley sought to reverse the onus. Since there was no political intent read into their appointment, none, he argued, need be read into their removal from office. And then, as a lawyer of fair eminence, Jaitley's final recourse was legalistic. "We have done nothing illegal," he declared and if the affected persons thought there were sufficient grounds, they were free to take the Government to court.

In pursuit of the new mantra of professionalism, Jaitley has appointed an "expert committee" to review the entire gamut of organisational issues connected to the electronic media. Bearing the onerous responsibility of proposing the new structure of Doordarshan and All India Radio are N.G. Narayanamurti, chairman of the sofware firm Infosys, Kiran Karnik, chief executive of the Discovery Channel, and Shunu Sen, the well-known management consultant. Rajiv Ratna Shah, Chief Executive Officer of Prasar Bharati, will be the convenor of the committee and official representation will be secured through the presence of R.C. Mishra, Joint Secretary in the Ministry of Information and Broadcasting.

P V SHIVAKUMAR

Arun Jaitley, Minister of State for Information and Broadcasting.

AUTONOMY was a greatly desired goal in the days of stifling official control over the electronic media. The basic framework of autonomy was spelt out in the Prasar Bharati Act, adopted by Parliament in 1990. It was a goal that the BJP had endorsed with few qualifications.

In the following years, a fairly well-structured set of attitudes towards media law has been in evidence among the main political parties. The Congress(I) has been indifferent towards the cause of autonomy and sluggish in its response to global changes. The Janata Dal, largely responsible for the enacting of the autonomy law, wrote its logical sequel during its next brief spell in power. For S. Jaipal Reddy, Minister for Information and Broadcasting in the I.K. Gujral government, notifying the Prasar Bharati Act in July 1997 – in less than three months since taking office – was an act of personal commitment, in the face of overwhelming political indifference.

In October 1997, Jaipal Reddy issued an ordinance that sought to iron out some of the rough edges in the Act. This exercise was necessitated in particular by the burgeoning growth of the electronic media since the Act was adopted in 1990. From being the relatively simple task of writing rules for one broadcaster, the mission of policy had been transformed into the multi-dimensional one of regulating the complex, technology-driven growth of the entire electronic media. Some of the provisions of the Prasar Bharati Act were in this reckoning best transferred to the jurisdiction of a Broadcasting Act, which would be much wider in scope. Jaipal Reddy's effort to kickstart the Prasar Bharati through ordinance was integrally connected to the legislative agenda he unveiled in November 1997, through the introduction of the Broadcasting Bill in Parliament.

The matter remained inconclusive, since the Gujral government resigned on November 27 over the patent triviality of the M.C. Jain Commission's interim report. Significantly though, the Prasar Bharati board had been partly constituted before the government quit. Following a formal communication of October 30, 1997, from the Ministry of Information and Broadcasting, Vice-President Krishan Kant had begun consultations towards the appointment of the board. Under the terms of the Act, the Vice President, the Chairman of the Press Council of India and a government nominee constitute the authority that appoints the members of the Prasar Bharati board. Jaitley's argument – that the board had been put in place by the United Front in its last days – is a non sequitur, since the entire process is outside the purview of the government.

Of the seven part-time members appointed to the Prasar Bharati board in November 1997, the eminent journalist Nikhil Chakravartty was designated Chairman. All the appointments were to a fixed term of six years, in accordance with the October ordinance. In the political flux that ensued, the ordinance was not brought before Parliament for ratification, which in effect meant that the provisions of the 1990 Act were restored to application.

Since May 1998, when the BJP first

assumed office at the Centre, the government has made no effort to frame rules under the Prasar Bharati Act. When the opportunity arose though, it was quick to seize upon the provision of the Act which requires that one-third of the members of the board retire every two years. Chakravartty's demise and the elevation of another member to a gubernatorial position meant that there were five members to choose from. Prasar Bharati itself was of the opinion that if the requirements of the law were to be met, the two retiring members could be chosen through a random draw of lots. Decrying this procedure as arbitrary, Jaitley chose to wield his hatchet against those he saw as dissidents with the BJP world-view.

M. LAKSHMANAN

Romila Thapar.

Romila Thapar's response was measured: "They have deliberately picked up the two persons who they thought were ideologically opposed to them. Quite clearly, it confirms their fear of people who do not share their opinion." The issue, she argued, was not confined merely to two individuals. Rather, it had a bearing on the autonomy and integrity of the institutions of democracy. On display was the same tendency to first hobble and then commandeer institutions by packing them with individuals of a particular political inclination.

Rajendra Yadav was more outspoken. Since the electoral process was set under way, he recalls, he had assumed the authority on behalf of the Prasar Bharati board, to monitor public grievances about the quality of political coverage in the electronic media. He had in this capacity received no fewer than 1,500 complaints from viewers about Doordarshan's unseemly bias towards the BJP. For every individual who writes, he argues, there must be at least a thousand who share the same perception. His experience in this respect reflects a fairly widespread sense of disaffection with the management of the electronic media by the BJP-led government. It is not in the character of the BJP, he concludes, to tolerate institutional autonomy or cultural diversity.

R.V. MOORTHY

Rajendra Yadav.

Jaipal Reddy for his part has denounced the government's action as "outrageously improper and clearly illegal". He has given notice for a parliamentary discussion on the issue and expects the backing of the Left parties in his endeavour to hold the government accountable. He has reason to be incensed. Until he infused life into the notion of autonomy in 1997, the government had begun to get lazily complacent over its absolute control over the media. The lull that followed that phase of activity has, however, created a massive burden of ambiguity in the domain of broadcasting law. Failing the enforcement of public scrutiny, it is a situation that seems ideal for the pursuit of the BJP's own rather sectarian agenda.

Rajendra Yadav is not yet quite prepared to give in. On December 2, he filed a petition in the Delhi High Court, challenging the government's decision to remove him from the Prasar Bharati board. Wide-ranging in its contents, the petition alleges that the Ministry's action betrays fundamental anti-intellectual and anti-democratic tendencies. The legal requirement only stipulates that two members should retire every two years. Since one of the six part-time members has already resigned on being appointed Governor, the needs of law would be met merely by retiring one of the remaining members. The Ministry has in this regard overstepped its authority and given transparent expression to its ideological biases, by choosing two known critics of the BJP for retirement.

The petition is scheduled to be heard on December 20. Clearly, the last word has not been said on the tortuous saga of media autonomy in India. ■

■ CONTROVERSY

T.K. RAJALAKSHMI
in New Delhi

THE Indira Gandhi National Centre for Arts (IGNCA), which recently faced a controversy over amendments made to its its original trust deed, is in a spot again. Among other things, the amendments had sought to make five members of the IGNCA Trust, including Congress(I) president Sonia Gandhi, life members. Now, the stepping down of former President of India, R. Venkataraman, from the post of life-trustee, and an audit report submitted by the Comptroller and Auditor General of India which has identified financial irregularities in the functioning of the trust, have added to the controversy.

While the CAG report has cheered the Bharatiya Janata Party, which has been calling for a top-level reconstitution of the IGNCA, the Congress(I) finds itself in an embarrassing position over the life-trustee issue. The other life-trustees are P.V. Narasimha Rao, H.Y. Sharada Prasad and Kapila Vatsyayan, academic director.

Venkataraman is believed to have stepped down after his attempts to persuade the Board of Trustees to stick to the original trust deed went unheeded. Observers, however, link the step to a public interest petition challenging the amendments to the trust deed, filed by Naresh Pandey, an advocate, in the Delhi High Court. Of late, Venkataraman is known to have had a congruence of views with the BJP on several issues, especially on a proposed constitutional amendment to ensure fixed terms for the Lok Sabha, supposedly in order to ensure the stability of governments. His decision to step down has buttressed the BJP-led Government's case to reconstitute the IGNCA.

Interestingly, although the public interest petition was filed in August 1998, it hit the headlines only during the run-up to the 1999 Lok Sabha elections. An affidavit was filed by the Human Resource Development Ministry (*Frontline*, July 30, 1999). The BJP-led caretaker government's move was seen by many people as part of its efforts to gain political mileage vis-a-vis the Congress(I). The government contended that the amendments made to the trust deed were invalid on three counts: one, the condition that "prior written approval" be obtained under Clause 24

More trouble at IGNCA

The exit of a life-trustee and the findings of a CAG report add to the woes of the Indira Gandhi National Centre for Arts.

of the trust deed was not complied with; secondly, "the rules of the Government of India relating to matters which may concern two departments" were overlooked; and thirdly, Rule 7 of the Rules which requires Cabinet approval for proposals to vary or reverse a decision previously taken by the Cabinet, was also not complied with. The affidavit stated that the amendments were, therefore, "invalid and have no standing in the eyes of the law."

The affidavit held that since the government had not received any response from the IGNCA regarding the legal position set out in two letters dated November 3, 1998 and January 27, 1999, the government would initiate appropriate proceedings and adopt measures that are necessary to ensure that obligations under the trust deed are discharged in conformity with the unamended provisions of the deed, besides taking necessary steps "to protect the interests of the government in respect of the moveable and immoveable properties made available by the government to the IGNCA, including resumption of the land, if required."

The IGNCA had another setback when a Division Bench of the Delhi High Court on September 23 allowed the Union Government to proceed against it (*Frontline*, October 22, 1999). Expressing its displeasure over Sonia Gandhi being made president of the trust, the Bench asked "how being the widow of a former Prime Minister conferred any qualification of being an expert on art and culture and entitled her to be president of the trust without authority from the government." On the issue of the IGNCA having received government funds over a period of time, the Bench observed that "merely because some eminent people are involved does not mean that the trust should be given largesse."

THE CAG report has come up with a fairly long list of irregularities. The first one relates to the sanction of an initial corpus fund of Rs.25 crores in March 1987, besides additional grants of Rs.25 crores between 1992-95. The audit report states that the provisions of the General Financial Rules of the government were violated in that grant of funds in the nature of a corpus is not allowed. A subsection of the Rules stipulates that sanction can be considered only on the basis of viable and specific schemes drawn up in detail by the institution concerned. Besides, interest accruals to the tune of Rs.24 crores were not used for IGNCA's programmes, but were re-invested in order to increase its income.

The IGNCA, which chose to remain silent on the issue of the trust deed, maintaining that the matter was sub judice and that the court was the ultimate arbiter, chose to react to the CAG report. It stated that the extra amount of Rs.25 crores was released by the Government of India on the recommendation of the Planning Commission's Working Group on Arts.

Former President R. Venkataraman.

The CAG report states that the IGNCA utilised only a small part of the Rs.3 crores sanctioned to it for observing the 10th death anniversary of Indira Gandhi, and that it had failed to return the Rs.2.85 crores that was unutilised. The IGNCA maintains that the money was transferred by the Department of Culture *suo motu* to the IGNCA on March 31, 1995, to be utilised as per the IGNCA's directions.

The CAG report charges the IGNCA with having received grants in excess of the actual requirement for constructing a building complex in 1995-96, and again in 1996-97. The IGNCA's response to this is rather ambiguous. It states that since March 1998, the construction of another building had been taken up, and that up to 90 per cent of the money released – which the CAG places at Rs.84.55 crores – had been utilised. The CAG, however, found that only 51.43 per cent of the grant released for construction was utilised. Justifying the receipt of extra funds, a press release from the IGNCA states: "This is normal in any building project, since expenditure is low in the initial stages and increases only as the work progresses." Against a total expenditure of Rs.45.52 crores required for constructing a complex, the IGNCA had, up to March 1998, received Rs.84.55 crores as separate grants, and had by March 1997 accumulated Rs.1.49 crores on investments from these grants, with the total amounting to nearly double the stipulated expenditure.

The CAG report stated that although the board of trustees was in favour of a government body serving as the construction management agency, the Central Public Works Department had been overlooked in favour of a private company, resulting in an extra expenditure of Rs.2.40 crores. The IGNCA, however, termed this "factually incorrect". The CAG also said that the architect selected to design the building failed to meet the deadline, as a result of which the estimated cost of the project increased from Rs.100 crores to Rs.330 crores. Although the architect could have been penalised under the terms of the agreement, the provision was not exercised.

THE CAG report and the trust deed issue are likely to keep the Congress(I) busy over the next few months. The petition in the High Court is scheduled to come up for hearing in January. For now, neither the IGNCA nor its political patron, the Congress(I), is in a confrontational mood.

An IGNCA spokesperson told *Frontline* that the amendments had taken the "spirit of autonomy in the original deed" to its logical conclusion. Rebutting the charge that the IGNCA was being run like a private trust, he said that no property, moveable or immoveable, could be alienated without the approval of the government. ■

Towards elections

The suspension of Kalyan Singh from the BJP has set in motion political processes that seem to lead inexorably towards early elections to the State Assembly.

VENKITESH RAMAKRISHNAN
in Lucknow

UTTAR PRADESH is heading for early Assembly elections This is evident from the developments within the Bharatiya Janata Party and the coalition government it leads in U.P., as well as the responses of the main Opposition parties in the State – the Samajwadi Party (S.P), the Bahujan Samaj Party (BSP) and the Congress (I).

The new political signals have come in three bundles First, it is the commotion within the State unit of the BJP as well as the coalition – involving partners such as the Uttar Pradesh Loktantrik Congress (UPLC) and the Janatantrik Bahujan Samaj Party (JBSP) in the wake of the suspension from the BJP of Kalyan Singh, former Chief Minister and one of the national vice-presidents of the party Secondly, the populist measures adopted by the State Government led by Ram Prakash Gupta, who has replaced Kalyan Singh as Chief Minister Thirdly, the manoeuvres by parties such as the S P and the BSP at the grassroots level

SUBIR ROY

Former U.P. Chief Minister Kalyan Singh with his successor Ram Prakash Gupta in Lucknow.

The suspension of Kalyan Singh from the party came on November 27, after three days of heated exchanges between him and the party leadership, including Union Home Minister L K Advani, who was once considered to be his benefactor The decade-old feuds between the supporters and detractors of Kalyan Singh had intensified to such a level that the central leadership was compelled to sacrifice a leader who was considered to be its biggest vote-catcher in Uttar Pradesh for nearly 15 years. The suspension reinforced Prime Minister Atal Behari Vajpayee's position in the party as its uncontested leader. The immediate provocation for Kalyan Singh's suspension was his sustained and vituperative campaign against Vajpayee, whom he held responsible for his removal from the Chief Minister's post.

Although party leaders sought to describe the suspension as a bold step meant to convey the message that no leader was indispensable to the party, the fact remains that it is bound to generate new complications for the party in U.P. Given Kalyan Singh's image as a champion of the backward castes, his expulsion could lead to an erosion in the party's base among these sections. Questions regarding Suspended from the Bharatiya Janata Party, former Chief Minister of Uttar Pradesh Kalyan Singh is clearly in a belligerent mood. He is even prepared to take on the might of the party establishment. In particular, he holds Prime Minister Atal Behari Vajpayee responsible for his suspension. But even his closest supporters do not seem to know how he will fight the BJP establishment.

Small groups of Kalyan Singh's followers have been assembling at his Mall Avenue residence in Lucknow almost every day since his suspension from the party. Meeting them, he resorts to stock phrases to describe his intentions. "I am waiting for the mango to ripen. I will not pluck it raw, nor will I allow it to overripen." Despite this tone of confidence, the general impression is that his pronouncements do not set out a clear political path.

In Lucknow, **Venkitesh Ramakrishnan** talked to Kalyan Singh about his plans and why he went against the "iron-cast discipline" of the BJP and the Sangh Parivar.

Excerpts:

▶ *After you were removed from the Chief Minister's post, you virtually invited suspension by going hammer and tongs against the Prime Minister. What made you do it?*

I was accused in a show-cause notice of bringing disrepute to the party and its office-bearers. The notice stated that I had done this repeatedly in the near and not-so-near past. I have been a loyal party worker for 45 years. I would like to know from the central leadership, including the respected Kushabhau Thakreji, to show a single instance of intemperance on my part. Nothing was pointed out in the notice.

The fact of the matter is that a group of BJP leaders, with the blessings

On the path of struggle

Interview with Kalyan Singh.

and sometimes under the active leadership of Prime Minister Atal Behari Vajpayee, was keen to defame me before the people and party supporters. One thought that this would stop once I stepped down from office in the larger interests of the party. But that did not happen. I had no alternative but to speak my mind on some issues. This has been branded as indiscipline. It is clear that they had decided to throw me out of the party.

Even while succumbing to the wishes and stratagems of this self-seeking group of party leaders and stepping down as Chief Minister, I expressed a wish that I be allowed to die as a party worker and my mortal remains covered in the party flag. These people have denied me even that one wish.

▶ *What will be your future course of action?*

Obviously, it is the path of struggle. Struggle for truth and justice and for the self-respect of the oppressed and the downtrodden. The BJP was once committed to these ideals. But from the look of things, the present leadership under Atal Behari Vajpayee seems to be giving up all its traditional slogans. My struggle is to revive all that. I know that this will be a strenuous exercise. But I am ready to wage a long and arduous battle to achieve it. I am repeatedly telling my followers that only those who are capable of hard and prolonged battles need join me. The initial response to my call has been very encouraging. I have received a favourable response not just from Uttar Pradesh but also from Madhya Pradesh, Delhi, Bihar and Rajasthan.

▶ *Would bringing down the present U.P. government and campaigning against the BJP in States where Assembly elections are imminent also be part of the struggle?*

I have no interest in toppling the government of the day. But it is already perceived as a weak government led by a weak Chief Minister, which is incapable of advancing the interests of the State and its people on independent strength and assessment. Hence, it will collapse under its own weight. If I want, this government would fall in less than 24 hours. But that is not the aim of my struggle. My struggle will be based on ideals and principles. As for campaigning against the BJP, I will take a decision when the time comes.

▶ *What socio-political slogans have you chosen to inspire your struggle?*

You won't have to wait long to find out. In a few days the slogans will emerge.

▶ *You have been concerned about the negligence of the backward castes by large sections of the upper-caste dominated BJP leadership, a stance that made you appear to be working in tandem with Mulayam Singh Yadav and the Samajwadi Party. At the same time, you have reiterated your commitment to the Hindutva agenda advanced by the Sangh Parivar. How will these issues be reconciled in your proposed struggle?*

Let me make it clear that I am not working in tandem with anybody. I have not approached any party, nor has any party approached me. The issues I raised with respect to the BJP are not merely with regard to the neglect of backward castes but of all oppressed sections. And in advancing this cause, Hindutva will be one of my guiding philosophies, whether some people like it or not. For me, Hindutva is a synonym for nationalism, Bharatiya identity, Bharatiya culture and Bharatiya heritage. My Hindutva does not differentiate between religions, classes, communities and beliefs. It is a concept that even illiterate people understand and one that is virtually the life breath of our country.

▶ *But during the Ayodhya agitation that culminated in the demolition of the Babri Masjid, the Hindutva stand was distinctly inimical to a minority community.*

That is a wrong assessment. And it is also not right to say that the disputed structure, which was demolished, was the Babri Masjid. I have repeatedly told my Muslim friends that in Ayodhya only the Ram Mandir can come up at the Ram Janmasthan. I have told them that they should cooperate in the construction of the Ram Mandir and Hindus would cooperate in building a beautiful masjid at a different spot in Ayodhya itself. This cooperation will become the finest symbol of communal harmony in the country.

▶ *You have been a worker of the Rashtriya Swayamsevak Sangh (RSS) for long. In the context of your expulsion from the BJP, what ties will you have with the RSS?*

When I was a seventh standard student, the RSS started a unit in my village. I joined it and I learnt the lessons of Hindutva from the RSS. The values and principles it represented will always be an asset for me and I too will always be an asset for the RSS. There will be no contradiction between the two.

▶ *Leaders such as former Jan Sangh leader Balraj Madhok who were ousted from the recognised political wing of the RSS made similar claims when they formed new political organisations. But they failed to make any real impact on mainstream politics.*

It is quite possible for history to change. ■

ing the party's strategy to meet such a situation do not evoke a clear reply from BJP leaders.

On the face of it, the BJP Legislature Party's immediate response is satisfying to the leadership. The response proved wrong Kalyan Singh's claim that he has the support of around 150 of the 175 party MLAs. Going by the number of MLAs who have met the former Chief Minister after his suspension, it seemed that he did not have any significant following even among the 60-odd MLAs belonging to the backward castes. In the first week after his suspension, merely six MLAs met him – and two of them belonged to the Samata Party and the Samajwadi Janata Party (SJP). Of the four BJP MLAs, only Kailash Rajput was actively mobilising support for Kalyan Singh. He organised small gatherings of party workers at the residence of Kalyan Singh, who addressed them.

The BJP leadership, however, is cautious. There is apprehension in the party that Kalyan Singh is biding his time, allowing his supporters to remain in the party and the government and enjoy the fruits of power for the time being, only to strike during the Assembly session due within a month. Kalyan Singh himself has stated that he has a secret plan for his supporters in the Legislature Party. As a

counter-strategy, the leadership is planning to elevate a few other backward caste leaders to key positions in the party and the government so that they could claim Kalyan Singh's mantle. Among the names being mentioned are Premlata Katiyar and Omprakash Singh, who have been considered Kalyan Singh loyalists all along. The attempt is to drive a wedge between Kalyan Singh and his supporters by winning them over. One of the posts that is likely to be offered to them is that of a working president, who would function under Rajnath Singh, president of the State unit.

Given Kalyan Singh's image as a champion of the backward castes, his expulsion could lead to an erosion in the party's base among these sections.

Rajnath Singh is being projected as a key player. Apart from being retained as State president, he has been given the portfolio of Surface Transport in the Union Cabinet. The plan, according to BJP insiders, is to capitalise on Rajnath Singh's image as a more dynamic and cleaner leader than other faction leaders such as Lalji Tandon and Kalraj Mishra. Many party leaders believe that such manoeuvres would help the party face Assembly elections as early as in March-April. In the normal course, Assembly elections in U.P. are due in June 2001.

The party has also made moves at the governmental level that would come in handy during the elections. The Government led by Ram Prakash Gupta has initiated measures that smack of populism, aimed at sections of people who have been alienated from the party in the recent past.

Among other things, the Government has decided to roll back some of the policy initiatives taken by the Kalyan Singh regime in the fields of local administration and power. The Kalyan Singh Government had proposed to give a greater role for local administrations in core sectors such as health and education. Accordingly, the local administrations could appoint teachers in panchayat and municipal schools as also some of the staff in primary health centres. These moves evoked some resentment, especially among teachers' unions. In fact, this was seen as one of the causes for the party's setback in the Lok Sabha elections. The latest decision is bound to make the teachers' unions happy.

The Kalyan Singh Government had also decided to privatise the power sector partly, which would have led to an increase in the cost of power, especially for commercial users.

The Ram Prakash Gupta Government has also decided to put on hold the proposal of its predecessor govenrment to introduce entry tax in the State, netting Rs.30 crores a year for the government. The new Government has apparently decided to defer the proposal, which is seen as a sop to the trading community.

Ram Prakash Gupta has stated that he plans to convene a meeting of MLAs of the coalition in order to evolve a consensus on these measures. The Government's decision to raise the floor price of sugarcane has won the appreciation of ruling party MLAs from the rural constituencies, as also farmers.

ONE factor that seems to have emboldened the BJP leadership is the conspicuous confusion in the Kalyan Singh camp. At the time of his removal from the Chief Minister's office, he was considering two options to counter his detractors – to join hands with S.P. president Mulayam Singh Yadav and form a broad coalition of backward castes, or to pursue his pledge, taken a day before his resignation on November 11, to renew the movement for the construction of a Ram temple at Ayodhya.

The general view in the Kalyan Singh camp at the time was that he would have to exercise the first option in the event of his expulsion from the party. A coalition of backward castes would have led to a direct confrontation between these sections and the upper castes. And a combination of such a coalition and the support base of the S.P. among Muslims would create a formidable front in U.P., it was thought.

Combining both the options was perceived as an effective move if he continued in the BJP as a dissident leader. The calculation was that by combining the Ram temple card and the backward caste tag he would cause embarrassment to the upper caste leaders in the party, particularly Vajpayee whom Kalyan Singh accused of having forsaken the party's agenda merely to keep his allies happy and hang on to power.

However, many of Kalyan Singh's supporters are dismayed that he has chosen to combine both the options even while facing the prospect of expulsion from the party. In interactions with supporters and the media following his suspension, Kalyan Singh has highlighted the Hindutva agenda (see interview). This naturally would alienate Mulayam Singh Yadav and the S.P. from Kalyan Singh. Many of his supporters point out that Kalyan Singh emerged as the champion of the Ayodhya movement owing to the support from the organisational machinery of the Rashtriya Swayamsevak Sangh (RSS). In the absence of such support, his move to revive the Ram temple agitation might fail.

KALYAN SINGH'S repeated pronouncements in support of the Hindutva agenda has forced the S.P. to reconsider its approach towards him. The party has made it clear that Kalyan Singh would not be invited to the backward caste rally that it is planning to hold in Lucknow on December 19. Obviously, Kalyan Singh's tacit understanding with the S.P. during the Assembly election period and his tactic of using the wedding reception of Mulayam Singh Yadav's son as an occasion to launch a tirade against Vajpayee has not paid dividends. On its part, the S.P. is likely to use the "humiliation" of Kalyan Singh at the hands of the upper caste leaders of the BJP as an emotive campaign issue to win the support of the backward castes owing allegiance to Kalyan Singh.

The BSP has also started preparing for elections. Its leader Mayawati has given a call to party units to take the message of 'Bahujan Samaj' to every part of the State. Mayawati has apparently held informal discussions with a section of the BJP led by Kalraj Mishra and Lalji Tandon on a possible electoral alliance. Mishra and Tandon are of the view that Kalyan Singh's backward caste politics can be effectively countered by a BJP-BSP alliance. However, central leaders such as K.N. Govindacharya are against this proposal. According to them, the BSP will lose its Muslim base to the S.P. in the event of an alliance with the BJP.

Political observers in U.P. see two future events as crucial – Kalyan Singh's proposed tour of the State in the second week of December for a mass contact programme, and the session of the Uttar Pradesh Assembly due in late December or early January. These events will give an opportunity to gauge the extent of support Kalyan Singh enjoys among the masses as well as the legislators. ■

Sympathy factors

Pro-LTTE groups use the issue of death penalty to step up propaganda in Tamil Nadu even as the clemency petitions of four persons sentenced to death in the Rajiv Gandhi assassination case await a decision.

T.S. SUBRAMANIAN

IN the guise of pleading against capital punishment, specifically the death sentence awarded by the Supreme Court to Nalini, Murugan, Santhan and Perarivalan in the Rajiv Gandhi assassination case, pro-Liberation Tigers of Tamil Eelam (LTTE) groups in Tamil Nadu have again become active. These assorted organisations had kept a low profile after Rajiv Gandhi's assassination by an LTTE member at Sriperumbudur, near Chennai, on May 21, 1991, as revulsion raged against the action. The Centre proscribed the LTTE the following year. The Supreme Court confirmed the death sentence against the four persons in May and October this year. Among the groups that have hitched on to the bandwagon of the campaign against capital punishment, none, barring the People's Union for Civil Liberties (PUCL), had taken a stand against the death penalty in the past.

Those who suddenly found their voice against the death penalty included top Tamil writers, who demanded on November 27 that "an eye for an eye, murder for murder, cannot be accepted in today's civilised society". Under the banner of "Tamil Writers Against Capital Punishment", writers such as Sundara Ramaswamy, Indira Parthasarathy, Ki. Rajanarayanan, Rajam Krishnan, Mu. Metha, Ponneelan, Kovai Gnani, Sirpi Balasubramaniam, Inquilab, and Pa. Jeyaprakasam said that there was a worldwide campaign against capital punishment and the time had come to abolish the death penalty in India. S.V. Rajadurai, a writer who belongs to PUCL, said that the campaign should cover not only Nalini, Murugan, Santhan and Perarivalan but all those who had been sentenced to death.

A number of organisations came together under the banner "Abolition of death penalty – Rally for humaneness" and organised a rally in Chennai on November 30. The explicit purpose of the rally was to appeal to Tamil Nadu Chief Minister M. Karunanidhi to recommend (to the Governor) the commutation of the death sentences on Nalini and three others. The organisations included splinter groups of the Dravidar Kazhagam (D.K.) such as the Periyar Dravidar Kazhagam and the Tamil Nadu Dravidar Kazhagam, the Tamil Scholars' Association, the Tamil Tamilar Movement, the Tamil Nadu Marxist-Leninist Party, the Association for Humaneness, the PUCL and the Tamil Eelam Supporting Organisation. The rally was led by P. Nedumaran, a pro-LTTE leader and president of the Tamil Nationalist Party, and Panrutti S. Ramachandran, founder of the People's Liberal Party.

Thousands of people including women, took part in the rally. Many men in the rally wore black shirts, which D.K. volunteers wear. Several youth had a black hood pulled over their faces to signify a prisoner about to be hanged. They carried pictures of the condemned prisoners and raised slogans such as "They are our people, their lives are our lives", "They are Tamilians", "Let capital punishment die, let humaneness flower", and "Death penalty is legal murder by the government" The processionists praised Karunanidhi's statement that he was generally against capital punishment.

At the conclusion of the rally, Nedumaran submitted a memorandum to Karunanidhi He said that 57 countries had abolished capital punishment and in 15 countries it was used only in the case of war crimes. Although 26 countries still had it on their statute books, they did not invoke the rule. This only proved that the death penalty was "inhuman", Nedumaran argued. He said that the campaign had gathered steam after the trial court had "in an unprecedented judgment" sentenced to death all the 26 accused in the Rajiv Gandhi case. (Nedumaran had sent a memorandum to the officials concerned against the death sentence awarded to Govindasamy, who is now in the Central Prison in Coimbatore, for murdering a family of five in Erode district. He urged Karunanidhi to initiate efforts to get the death penalty scrapped.

The rallyists directed their plea to Karunanidhi as the Madras High Court

P. Nedumaran, president of the Tamil Nationalist Party, leading a rally in Chennai on November 30 against the death sentences awarded to Rajiv Gandhi's killers.

has ruled that as per the Constitution the Governor can act on commuting a death sentence only on the advice of the Council of Ministers. (The High Court set aside Governor Fathima Beevi's order rejecting the mercy petitions of the four prisoners. Justice K. Govindarajan ruled that the Governor's order cannot be sustained as "the procedure of getting advice from the Council of Ministers by the Governor" under Article 161 of the Constitution was "not followed". The judge maintained that "it is for the first respondent (the Governor) to pass a fresh order" on the clemency petitions of the four "after getting the advice of the Council of Ministers".)

On December 2, when reporters asked Karunanidhi whether a positive decision would be taken on the clemency petitions, he replied that it was the President who had to take a decision. On the High Court's decision that the Council of Ministers should tender its advice, he said the Tamil Nadu Government was consulting legal opinion on the order.

EVEN as the State Government was caught in a cleft stick on this politically sensitive issue, Congress(I) president Sonia Gandhi, in a private meeting with President K.R. Narayanan, conveyed her family's "feelings" that the life of Nalini should be spared because she is the mother of a child. (Nalini married Murugan after the assassination, and a child was born to them in prison.) Sonia Gandhi said: "It is my personal feeling, keeping the need of a mother for a child."

Sonia Gandhi first spoke about her meeting with Narayanan to Mohini Giri, Chairperson of the Guild of Service, when Mohini Giri met her and pleaded Nalini's case. Mohini Giri had petitioned Narayanan for the commutation of the death sentences."Mrs. Gandhi told me that she had already conveyed to the President to commute the death sentence against Nalini and had no objection to our filing a mercy petition," Mohini Giri said.

Sonia Gandhi's position drew sharp remarks from some present and former leaders of the Congress(I). M.S. Bitta, former president of the Indian Youth Congress and chairman of the All-India Anti-Terrorism Front, is firmly against the commutation of the death sentence awarded to Nalini. Her punishment should "act as a deterrent for others", he said. If the sentence was commuted, it would encourage people pursuing the "politics of elimination" to use women as suicide bombers and target more leaders, Bitta said.

G.K. Moopanar, president of the Tamil Maanila Congress (TMC), said that the pleas for the commutation of the death sentences were as horrendous as the murder of Rajiv Gandhi.

Vazhappadi K. Ramamurthi, president of the Tamilaga Rajiv Congress (TRC), said that Sonia Gandhi's stand showed her "immaturity" and that she had made the plea to gain "cheap publicity". Her stand hurt the feelings of Rajiv Gandhi loyalists, he said.

THE four condemned prisoners had sent separate clemency petitions to the Governor on October 17. The Governor rejected the petitions on October 27. They filed writ petitions in the High Court stating that the Governor had rejected the petitions in a "hasty manner", without seeking the advice of the Council of Ministers. This was "illegal, arbitrary and violative of the Constitution," they argued. (*Frontline*, November 26, 1999).

Senior advocate K. Chandru, who appeared for the petitioners, said that the Governor could exercise her power under Article 161 only after getting the advice of the Council of Ministers. Even then, the Governor was bound by the advice of the Council of Ministers, and so he/she had no discretionary powers. The power to grant clemency was a sovereign power, which lay with the people. In a republican system of government, the Governor was a figurehead and the real power lay with the elected Ministers. Therefore, Article 161 could be exercised only by the Council of Ministers in the name of the Governor, Chandru argued.

Additional Advocate-General T.R. Rajagopalan, who appeared for the State, argued that clemency petitions (filed under Article 161) were not a subject matter in Schedule No.II of the Tamil Nadu Government Business Rules. Schedule No.II contemplates cases that could be brought up before the Council of Ministers. Rajagopalan said that on this basis and also referring to Rule 35(1)(a) and Rule 35(1)(b), the mercy petitions with all the materials had been forwarded by the Chief Minister, who was also in charge of the Home Department, to the Governor. So the question of getting further advice from the Council of Ministers would not arise when the Business Rules did not contemplate such a procedure, he submitted.

Chandru said that if the Government had been forwarding clemency petitions since 1947 to the Governor without tendering the advice of the Council of Ministers, this was done contrary to the spirit of Article 161. Even if it was a practice adopted by the State as understood by it in terms of its Business Rules, such a practice was unconstitutional. Chandru referred to Rajagopalan's argument that the Council of Ministers had framed the Business Rules and it had willingly empowered the Governor to decide on clemency petitions. According to Chandru, the Council of Ministers cannot surrender its authority or power of giving advice under Article 161 and the Business Rules cannot run contrary to the Constitution.

In his order, Justice Govindarajan referred to several Supreme Court verdicts that had held that the Governor had no discretionary powers under Article 161. He quoted the verdict in *Kehar Singh v. Union of India*, which stated: "...the President's power under Article 72 falls squarely within the judicial domain and can be examined by the court by way of judicial review."

He quoted from the order in *Maru Ram v. the Union of India*, which said: "The State Government, whether the Governor likes it or not, can advise and act under Article 161, the Governor being bound by that advice." The apex court said: "It is not open either to the President or the Governor to take independent decisions or direct release or refuse release of any one of their own choice...The constitutional conclusion is that the Governor is but a shorthand expression for the State Government and the President is an abbreviation for the Central Government." In *State of Punjab v. Joginder Singh*, the Supreme Court had insisted on the requirement of the President and the Governor getting the advice from the Council of Ministers while exercising powers under Articles 72 and 161. In *U.P.P.S.C. v. Sureshchandra Tewari*, the Supreme Court said: "Neither the President nor the Governor is to exercise the executive functions personally."

Merely forwarding the material to the Governor could not be construed as giving advice, the Judge said. He supported this view by quoting from *S.R. Bommai v. Union of India*, in which the apex court had said: "The material placed before the President by the Minister/Council of Ministers does not thereby become part of advice. Advice is what is based upon the said material. Material is not advice."

A contentious report

A Commission of Inquiry that went into incidents of caste-related violence of two districts in Tamil Nadu in 1995 and a police outrage in a Dalit village, justifies the police firing and makes controversial recommendations for the abolition of "concessions" to socially deprived sections.

S. VISWANATHAN

ON November 23, at the fag end of a session of the Tamil Nadu Assembly, the Dravida Munnetra Kazhagam (DMK) Government headed by M Karunanidhi tabled the report of a judicial inquiry commission that had been lying with the government for nearly four years. The report of the Gomathinayagam Commission of Inquiry, which was appointed in September 1995 to go into incidents of caste-related violence in the two southern districts of Tirunelveli and Tuticorin in July and August 1995, was submitted to the All India Anna Dravida Munnetra Kazhagam Government headed by Jayalalitha in March 1996.

The Commission held that the police firing in three places in the districts was "fully justified" and that there was "no excess" in the police action at the all-Dalit Kodiyankulam village in Tuticorin district on August 31, 1995.

The report drew flak from political parties representing Dalits, who were the victims of the police outrage at Kodiyankulam (*Frontline*, October 20, 1995), and from the Communist Party of India, the Communist Party of India (Marxist), the Tamizhaga Rajiv Congress and the Dravidar Kazhagam.

Two of the five terms of reference of the Commission were of a general nature: to report on the circumstances that led to the incidents and to recommend preventive measures. Others were more specific: "to inquire into and report whether in the police action in Kodiyankulam village of Ottapidaram taluk on August 31, 1995 there was any excess on the part of the police and the district administration and, if so, to give details of excesses and identify the errant police and other officials"; to find out whether the incidents of police firing at Sivagiri on July 30, 1995, Singathakurichi on August 25, 1995 and Kodiyankulam on August 31 were justified; and to make recommendations on payment of compensation to the victims.

The principal item therefore related to the brutal attack on the Dalits of Kodiyankulam on August 31 by a 600-strong police force, which gave a new dimension to the caste-related clashes that had rocked the two districts for over a month. The clashes, between sections of Dalits and of people belonging to the predominant Thevar caste, were triggered by an altercation between a bus driver and a Dalit student at a village in Tirunelveli district in July 1995. Following the disfigurement of a statue of U. Muthuramalinga Thevar, a nationalist and a leader revered by Thevars, the clash spread to the neighbouring Tuticorin district.

Eighteen persons, from among Thevars and Dalits, were killed and property worth lakhs of rupees was lost in the violence. In Tirunelveli district, where Thevars are larger in number and financially more sound, Dalits were the worst hit; in Tuticorin district, Thevars, being a minority in a number of villages, suffered the most in terms of human life and property. In both the districts, however, Dalits suffered the most at the hands of the police (*Frontline*, December 1, 1995).

The police action at Kodiyankulam was ostensibly aimed to arrest certain suspects in a murder case and seize explosive materials and lethal weapons believed to have been in the possession of Dalits. Observers, however, said that the police suspected that the people of this relatively affluent all-Dalit village (some of whose relatives were employed in the Gulf countries) provided moral and material support to miscreants in the surrounding area. The purpose of the four-hour-long police operation, according to observers, was to destroy the economic base of the village. Several villagers told visiting mediapersons that they had been brutally attacked by the policemen. Media reports, backed by photographic evidence, spoke of extensive damage to houses and a government-run fair price shop, destruction of household articles such as television sets, sewing machines and bicycles, besides tractors and lorries. There were

Dalit victims of the police action in Kodiyankulam village in August 1995. The Gomathinayagam Commission of Inquiry has concluded that there was no "police excess".

'An inhuman act by the police'

Interview with V. Vaikunth, former Director-General of Police.

"Never in my career spanning over 30 years have I witnessed such a totally inhuman act on the part of my own police." This was how former Director-General of Police V. Vaikunth described the plight of the people of Kodiyankulam following a massive police rampage in the village on August 31, 1995. As the then police chief, he visited the affected village on September 5 and saw for himself the "mindless violence" of the policemen. Now retired, Vaikunth became a bit emotional when he recounted in an interview to S. Viswanathan what he saw in Kodiyankulam. "Even now, after four years, it makes me sad and anguished when I recall the wailing and weeping of the hapless Dalits," he said. Excerpts:

▶ *The report of the Gomathinayagam Commission has ruled out any police excesses in Kodiyankulam in 1995. It is a matter of public knowledge, and there were media reports at that time, that you, as the Director-General of Police (DGP), visited the village and found to your shock that the police had indulged in "mindless violence" against Dalits of the village. There were also reports that you sent a note to Chief Minister Jayalalitha. A writ petition was filed before the High Court seeking a direction for the release of the report. Can you please enlighten the public on this sensitive issue?*

It is true that as the DGP I had received a series of complaints that the police had allegedly gone on a rampage in the village against Dalits. There were even writ petitions in the High Court, besides representations to the National Human Rights Commission, alleging police high-handedness. Political parties also raised a furore over the issue. The background to the alleged police violence at Kodiyankulam related to caste clashes which rocked Tirunelveli and Tuticorin districts during that period.

It is in this context that I visited the village on September 5, 1995 to find out the truth for myself. En route to Kodiyankulam, I also visited a number of villages which had witnessed caste clashes. There were attempts to dissuade me from going to Kodiyankulam. I could sense that the people of the village were very annoyed with the police in general, but when they came to know of my visit, the village elders came to the outskirts and received me. That was a reflection of the confidence I had created among the public about my impartiality and neutrality during my service as the Superintendent of Police in the composite Tirunelveli district (in the 1970s).

What I saw at Kodiyankulam that day was heart-rending. The police had gone berserk in the name of repulsing an imaginary attack on them by the villagers. The policemen had reportedly gone to the village to secure an accused involved in the murder of a person belonging to a predominant caste in the region. They had indulged in mindless violence against hapless Dalits of the village – men, women and children. The police had ransacked their houses, damaged their television sets, ripped open the rice bags and thrown the rice on the streets. Worse and still more

also charges that the raid party poured diesel and pesticides into the public well in order to render it unusable. (The High Court had, in response to a petition, directed the district administration to ensure supply of drinking water to the village.)

That Dalits had lost faith in the police and the district administration was clear from a writ petition that had been filed in the Madras High Court by the Devendra Kula Vellalar Federation (which later became a political party named Puthiya Thamizhagam) led by Dr. K. Krishnasamy. It sought an enquiry into the incidents by a Central agency and prayed for legal proceedings under the Indian Penal Code and the Scheduled Castes and Scheduled Tribes (Prevention of Atrocities) Act against the District Collector, the Superintendent of Police and others responsible for the attack on Dalits. (On the orders of the High Court, the Central Bureau of Investigation is enquiring into the incident. P. Sampath, member, State Secretariat, of the CPI(M) and one of the petititoners seeking a CBI enquiry, told *Frontline* on December 4 that he would move the court again to get the enquiry expedited. Sampath was among the first political leaders to visit the affected village, as secretary of the district unit of the party.)

The Jayalalitha Government denied that police excesses had been committed at Kodiyankulam. Director-General of Police V. Vaikunth visited the village on September 5, 1995 and, on the basis of what he saw, sent a report to Chief Minister Jayalalitha (see interview).

A three-member team of Ministers sent by Jayalalitha met with hostility at Kodiyankulam. The Government ordered payment of about Rs.17 lakhs as relief assistance to the victims and appointed P. Gomathinayagam, a retired District Judge, as the one-man Commission of Inquiry.

THE Commission submitted its report to the Government on March 12, 1996. Dalits of Kodiyankulam and other villages boycotted the inquiry since the Devendra Kula Vellalar Federation had moved the High Court seeking a CBI inquiry.

The Commission examined 26 witnesses from the government, mostly police officials, including the Superintendent of Police, and 133 public witnesses. (Curiously, it did not summon Vaikunth to depose.) With Dalits boycotting the Commission, most of the public witnesses belonged to the other caste involved in the incidents, Thevars.

On the Kodiyankulam incident, the Commission observed, "There is not an iota of evidence to conclude that there was police excess." It, however, said that the police action "did not happen in the manner as told by the police and other officials." The Commission agreed with advocate P. Ganapathy Subramanian, who represented the Communist Party of India before it, that there were incongruities and discrepancies in the police version of the "combing operations". The Commission referred to the lack of any explanation from the police regarding two missing shells and said "this also throws some doubt" about the police operation. It took note of the failure of the police to produce the register showing the movement of police vehicles, which could have thrown light on the duration of the operation.

The Commission did not believe that the purpose of the combing operations was to break the economic base of the affluent Dalits of Kodiyankulam. It said: "Much was said about their affluence but there is no material to support this."

According to the Commission, the copy of the complaint lodged with the

inhuman was their act of pouring diesel in the drinking water well. The police had also torn to pieces the university degree certificates of the boys and girls of the village. The villagers started wailing and weeping and what I witnessed shook me to the bones. Never in my career spanning over 30 years have I witnessed such a totally inhuman act on the part of my own police. I believed every one of the villagers when they explained what happened, because I saw for myself the bitter trail of police violence. But then I wanted to convince myself about the truth. So I called the S.P. who accompanied me, took him aside and asked him under the shade of a tree in the village to come out with the truth. In the presence of the Deputy Inspector-General of Police of the range, the S.P. admitted to all that had happened.

I returned to Chennai and made arrangements to send relief at my level to the victims of the village Later, after getting the details of the pending criminal cases connected with the various caste clashes, I sent a note to Chief Minister Jayalalitha on September 15 suggesting certain immediate steps to be initiated to restore the confidence of the victims of violence: (1) To sanction adequate compensation to the villagers for the suffering they had undergone; (2) To send a team of Ministers who did not belong to any of the predominant castes of the district, with a view to assuaging the feelings of the villagers; (3) To constitute a commission of inquiry, and (4) To order dropping of action in all the criminal cases relating to the caste clashes (except cases involving violence and murder) in which I had found after my assessment that people belonging to either community had been implicated without basis.

Jayalalitha was so moved by my report that she sent for me on September 16 and told me that she had conceded all my suggestions. On September 17, the birth anniversary of Periyar (E V. Ramasamy), Jayalalitha was to garland the Periyar statue at the Anna flyover in Chennai. At that function, the three Ministers who had been deputed by Chief Minister Jayalalitha to tour the affected areas showed me copies of my note to Jayalalitha and requested me to suggest the steps they should take. On the basis of the findings of the ministerial committee, Jayalalitha announced a relief assistance of Rs.17 lakhs, the constitution of a committee of inquiry and the withdrawal of the cases. To be fair to Jayalalitha, this is one instance where she got a bad name for no fault of hers, because of the police violence (at Kodiyankulam) which, in fact, cost her heavily in the 1996 elections in the area.

▶ *But the Gomathinayagam Commission has totally ruled out any police excess.*

I have no comments to make because I do not know on what basis the Commission has come to that finding. But I can only say that what I found, which I have narrated now, is true, and what I wrote in my note to Chief Minister Jayalalitha based on what I saw was again true. ■

Maniyachi police station by a resident of Kodiyankulam on behalf of the residents, "the one important piece of evidence", speaks only of damage to houses, not to household articles The Commission said that during "local inspection" of Kodiyankulam some houses were found to be damaged "There is practically no explanation for this and at the same time there is not a shred of evidence to conclude that the police were responsible for the damage to some houses at Kodiyankulam," the Commission said

The Commission visited the affected villages. At Kodiyankulam he could see only one house and the well and had to cut short his visit when the people told him that they were boycotting the Commission.

The Commission concluded that the police firing at Kodiyankulam and in the other two places was "fully justified"

Stating that the genesis of the trouble (an incident at Veerasigamani village on July 15, 1995, when some students took a bus driver's scolding "for obstructing the free movement of the bus" as an insult) was "non-communal", the Commission observed that the incidents that followed could not be described as "communal clashes".

The Government took on record the Commission's finding that the term "communal clash" was a misnomer when used with reference to the incidents, and accepted the recommendations with regard to the other terms of reference (Interestingly, the DMK had in 1995 criticised the police action in Kodiyankulam and even used it as a campaign issue in the 1996 Assembly elections)

In its report accompanying the findings, the Government said that it had decided to examine the specific recommendations made by the Commission to ensure public peace and prevent the recurrence of such incidents The recommendations included a total ban on the erection of statues in public places and plans to eradicate illiteracy

THE Puthiya Thamizhagam, the Viduthalai Siruthaigal, the two Communist parties and the Dravidar Kazhagam have taken strong objection to, among other things, the Commission's recommendation that "all concessions to any community, whatsoever, may be abolished forthwith". CPI(M) State secretary N Sankariah said that any such move would do great harm to the people belonging to the Scheduled Castes and the Backward Classes The Government should, in fact, implement the reservation policy with earnestness and clear the backlog

Both Sankariah and Krishnasamy felt that the Assembly ought to have been provided an opportunity to discuss the report. Krishnasamy said that Dalits could not be expected to give up their hard-won claims to the concessions guaranteed by the Constitution Viduthalai Siruthaigal president R Thirumavalavan said that such recommendations only betrayed a lack of understanding of the social dynamics and the history of the evolution of the concept of social justice

CPI State secretary R Nallakannu, who rejected the report outright, wondered why the Commission, which had held that the incidents were not caste-related, thought it necessary to suggest steps to avert caste-related clashes Krishnasamy said that a government note accompanying the report contained the names of 126 persons belonging to Kodiyankulam and the amount of compensation paid to each on account of loss of property If the police had not caused damage to their property, who else did it, he asked "It is an all-Dalit village and people from no other caste lived there. So, the question remains," Krishnasamy said. ■

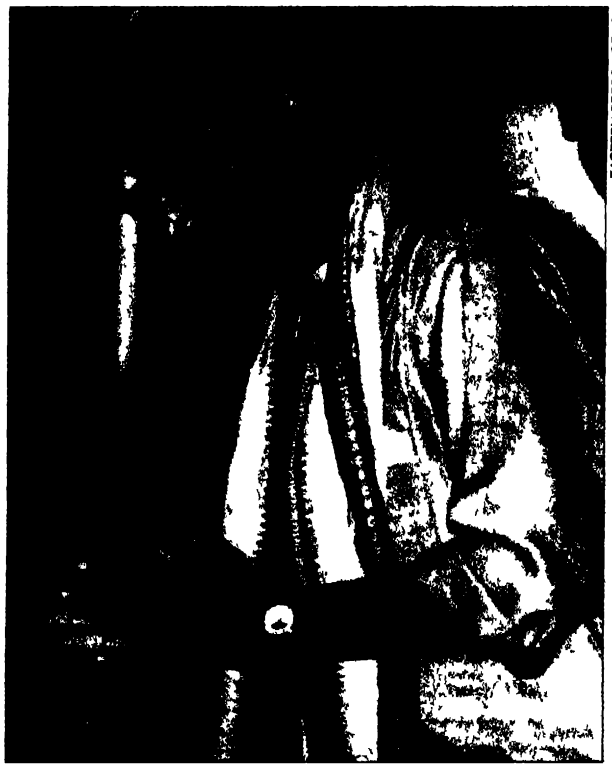
The political storm

As pressure mounted on Orissa Chief Minister Giridhar Gamang to step down, the central Congress(I) leadership faced a difficult choice.

KALYAN CHAUDHURI

WITHIN 10 months of his appointment, Orissa Chief Minister Giridhar Gamang was under heavy pressure (as on December 4) to relinquish his post. After a week-long tussle with his detractors in the State Congress(I), Gamang seemed to be on his way out, with the majority of his Cabinet colleagues and party legislators demanding his resignation. Congress(I) president Sonia Gandhi was not in favour of considering a leadership change, but following persistent demands from rebel legislators, including former Chief Minister J.B. Patnaik and Basant Biswal, former Deputy Chief Minister and then Agriculture Minister under Gamang, she sent three teams consisting of All India Congress(I) Committee members between November 30 and December 3 to ascertain the views of the MLAs on the leadership question, and also to quell wrangling in the State unit. The Congress(I) emissaries included Madhavrao Scindia, Vayalar Ravi, Motilal Vora and Ramesh Chennithala.



The leaders held prolonged discussions with the MLAs, Pradesh Congress(I) leaders and those leading the warring factions. They included Patnaik, Nandini Satpathy, (State unit president) Hemanand Biswal, Basant Biswal, Kanhu Charan Lenka, Jagannath Patnaik, Niranjan Patnaik, Bhagabat Prasad Mohanty, Raghunath Patnaik, Sheikh Mutlub, Durga Shankar Patnaik, and Bhupinder Singh. Matters had come to such a pass that at one point, Sonia Gandhi had to summon to Delhi J.B. Patnaik and Basant Biswal, who were leading the revolt against Gamang, to hear their versions. Gamang, who seemed determined not to step down, also rushed to Delhi. He demanded to know why he should step down when he was handpicked by Sonia Gandhi herself in place of Patnaik in February following the murder of Australian missionary Graham Stewart Staines and his sons and also the Anjana Mishra rape case in the State.

From the outset, Gamang had insisted that he would not succumb to any kind of pressure to step down. He maintained that he would quit only if the high command asked him to do so. He was reported to have told Sonia Gandhi that he would abide by her decision, making it clear that she should either ask him to step down or check anti-party activities.

In order to stall his detractors' moves, Gamang left for Delhi soon after a Congress(I) Legislature Party (CLP) meeting on November 30, thereby avoiding a situation in which he would have had to face embarrassment in the Assembly. This enabled him to avoid calling the Assembly into session on December 1 as had been scheduled. He met the newly-appointed Governor, M.M. Rajendran, before his trip to Delhi, with a request to him to defer the convening of the session until December 10. The Governor obliged Gamang. The Bharatiya Janata Party (BJP) and the Biju Janata Dal (BJD) described the Governor's decision as "undemocratic".

Sonia Gandhi's initial hesitation to remove Gamang was understandable as it was she who had installed him in office. However, she came under increasing pressure from Gamang's detractors who were adamant that he should go. The rebel MLAs threatened to break away if Gamang was allowed to continue.

The first AICC team comprising Scindia and Ravi was sent to Bhubaneswar when 50 of the 84 party MLAs in a House of 147, demanded that the high command remove the Chief Minister. They accused him of being unable to handle the relief and rehabilitation works in the 12 cyclone affected coastal districts. Rebel Congress(I) leaders, all supporters of J.B. Patnaik, had told the AICC(I) leaders that they would not be able to face the Assembly elections, due in March 2000, under the leadership of Gamang and PCC(I) president Hemanand Biswal.

EASTERN PRESS AGENCY

Giridhar Gamang.

On November 21, dissident MLAs, including 11 Ministers, made it clear to AICC(I) leaders Pranab Mukherjee, Scindia, Ravi and Mukul Wasnik, when they were in Bhubaneswar during a PCC(I) executive meeting, that if Gamang and Hemanand Biswal were not replaced immediately, they would elect a new Congress(I) Legislature Party (CLP) leader before the Assembly session.

Gamang was on a sticky wicket because the majority of Congress(I) Working Committee (CWC) were opposed to him, although Sonia Gandhi resisted the pressure. AICC sources said that her first priority was "damage control" and preventing the rebels from splitting the CLP. But pro-changers in Delhi and Bhubaneswar were elated, pointing to inadequate support for Gamang in the CLP. The

brief for Scindia and Ravi was to interact with the MLAs and report back to the central leadership.

The crisis intensified after Scindia, during his second visit to Bhubaneswar on November 30, said that the central leadership would "respond to the sentiments of the majority at the CLP meeting". Scindia said that Delhi still had faith in Gamang, whom he called a "straightforward" man, but would accept the legislators' demand.

Gamang's opponents, with the backing of Patnaik and Basant Biswal, threatened to oust him at the CLP meeting if Sonia Gandhi did not remove him. They called Gamang "inept" and "incapable" of running the government. Gamang suffered a blow when Biswal, who engineered Patnaik's ouster in February, pledged support to the former Chief Minister. Sonia Gandhi's move to send Scindia and Ravi to the State capital came hours after Gamang met her and pleaded with her to make up her mind on the leadership issue.

A FRESH crisis soon took shape in the State unit. Bickerings started over who would succeed Gamang. J.B. Patnaik and Basant Biswal, who had joined forces for the oust-Gamang campaign, parted ways, each projecting himself as a candidate for the post. The issue thus boiled down to a contest between pro-Biswal and pro-Patnaik supporters. Nearly 40 MLAs were reported to have faxed a letter to Sonia Gandhi requesting her not to replace Gamang; this was done primarily to keep Patnaik out. Biswal's supporters are of the view that Gamang should continue in the post if Biswal could not be made Chief Minister. Moreover, opposition to Patnaik was mounting in Delhi with K.P. Singh Deo, MP, and K.C. Lenka, former Minister, ranged against him. With no consensus emerging, the high command had difficulty identifying a successor who would be acceptable to all the factions.

Meanwhile, an AICC(I) panel comprising Ghulam Nabi Azad and Ravi has projected a grim scenario for the party in the coming Assembly polls. The A.K. Antony panel, which was constituted to go into the reasons for the party's debacle in Lok Sabha elections, was also reported to have indicted the Gamang regime for poor performance. It was clear that the party would not be able to ignore the fact that with the Assembly elections round the corner, any change in leadership could be detrimental to its electoral prospects *vis-a-vis* the BJP-BJD alliance. ■

Succour for Orissa

International agencies, non-governmental organisations and the State Government grapple with the task of rebuilding the cyclone affected areas of Orissa.

SUHRID SANKAR CHATTOPADHYAY
in Bhubaneswar

MORE than a month after a super-cyclonic storm ripped through the 12 coastal districts of Orissa, the State Government is faced with the task of rehabilitation, reconstruction and employment generation in the affected region. The October 29 cyclone destroyed more than 30 lakh houses and devastated thousands of hectares of agricultural land. The official death roll stood at 9,881, while unofficial estimates put the number at 30,000.

A high-power Task Force was set up on November 10 with Defence Minister George Fernandes as its chairman, and Secretaries from the Ministries of Agriculture, Finance, Power, Water Supply and Telecommunications as members. Apart from monitoring relief operations, the Task Force will prepare a comprehensive action plan, which will include short-term and long-term measures for rehabilitation and reconstruction. It will recommend the mode of implementation of the plan and ways to finance it, and suggest measures for ensuring preparedness in future in the cyclone-prone areas.

Jagannath Mohapatro, the Mayor-in-council of Bhubaneswar, told *Frontline* that 193 slums in the municipal corporation area and on its outskirts had been destroyed and about 50,000 families had been rendered homeless. Infrastructural damage in the municipal area itself is estimated at Rs.100.5 crores. Mohapatro said that at least Rs.5,000 would be required to rebuild each dwelling unit. He said that with the onset of winter there was an urgent need for 6,000 rolls of polythene sheets to provide shelter.

A serious fallout of the calamity is unemployment. Mohapatro fears that job-seekers from the affected rural areas were bound to migrate to the cities in search of means of livelihood.

C.J. Venugopal, vice-chairman of the Bhubaneswar Development Authority (BDA), told *Frontline* that Rs.11 crores would be generated for rehabilitation and reconstruction in the areas under the BDA's jurisdiction. A slum-improvement project to provide shelters that can withstand cyclones would be implemented in a phased manner. Moreover, as most of the slums are unauthorised, the BDA is looking for areas where a large number of people can be resettled.

The total cost of reconstruction and rehabilitation has not yet been fully assessed; it is expected to be an astounding figure, though. Biju Janata Dal leader Bijoy Mohapatra, who is the chairman of the Public Accounts Committee of the State Assembly, said that at least Rs.10,000 crores would be needed to put the affected areas back on the path of development.

A scheme has been devised to provide low-cost houses with financial assistance from the Orissa Rural Housing and Development Corporation Ltd (ORHDC), taking recourse to funds from the Housing and Urban Development Corporation (HUDCO) under a credit-linked system. The loan amount per unit will be Rs.30,000, at 11 per cent interest. The loan will be recovered in 15 years with an initial three-year moratorium on repayment. The programme will be monitored by the Housing and Urban Development Department, and the respective district authorities will coordinate its implementation.

Moloy Chatterjee, the regional chief of HUDCO, told *Frontline*: "HUDCO has extended an assistance of Rs.487.5 crores for the construction of 1,35,000 houses. In addition, its grant-in-aid assistance for building centres and model villages amount to Rs.215 crores."

The State Cabinet, at a meeting on November 29, decided to seek a loan of Rs.900 crores from the Centre in order to undertake house construction. It was planned to disburse Rs.300 crores through the District Collectors and another Rs.300 crores through the

ORHDC. The remaining amount would be distributed as loans to government employees whose houses have been damaged. The Cabinet also decided to increase the quantum of the State Contingency Fund from Rs.60 crores to Rs.150 crores.

Non-governmental organisations (NGOs), such as HelpAge India, National Youth Service Action and Social Development Research Institute, are engaged in the rehabilitation of 5,000 families in Puri, Jagatsinghpur and Cuttack districts and in Dhenkanal. HelpAge India plans to spend Rs.2.5 crores towards rehabilitation and restoration of facilities. Industrialist Abhey Oswal has floated a trust to help rehabilitate victims. At a press conference in Bhubaneswar, he said that the Aruna-Abhey Oswal Trust had been formed with a corpus of Rs.40 crores, which would be utilised by March 2000. The Trust would generate Rs.200 crores in the next five years. He said that banks would also be approached to extend loans to the affected people.

CARE International plans to spend Rs.120 crores under a three-year rehabilitation and economic restoration programme in 11 blocks of four districts. The president of CARE International, Harold Walker, said at a press conference that Rs.40 crores would be spent on relief operations and Rs.60 crores on rehabilitation and construction of cyclone-proof houses.

The Chennai-based RYA-Cosmo is involved in the rehabilitation of 300 families in Jagatsinghpur district. Puri district, which has been adopted by the Delhi State Government, has already spent Rs.5.5 crores for rehabilitation and reconstruction. The Maharashtra Pradesh Congress(I) Committee is planning to construct special cyclone aid centres in Paradeep.

A United Nations-led relief and rehabilitation programme is on in full swing. The deputy resident representative of the U.N. Development Programme, Niels Maagaard, told *Frontline*: "The U.N. family is fully committed to the rehabilitation and economic restructuring of Orissa for the next one year. We have about 50 non-governmental organisations working with us. We want to establish offices in the affected districts for better coordination of relief activities. Our representatives in the districts will ensure equal distribution of relief materials and assess the needs of the people." The U.N. has set up a network in the affected villages and towns and is monitoring programmes of health education, childcare, and nutrition. The priority now, says Maagaard, is to provide housing and shelter and employment. "Food for work is the best solution and we want to encourage that," he said. The U.N.'s goal was not just to take Orissa back where it was, but to help it go beyond that point. "This is the perfect opportunity to rebuild the whole State and make it better than it ever was," said Maagaard.

IN Ersama block, one of the worst affected areas of Jagatsinghpur district, 11,000 families have no dwellings. Additional Special Relief Commissioner S.K. Jha told *Frontline* that all arrangements had been made to supply food, polythene sheets and blankets. "Till date we have handled 1,500 tonnes of relief arranged by the government," he said. Some parts of Ersama block which were inaccessible till mid-November, have been reached by road and by boats. Jha said that according to reports from sarpanchs, 8,019 people were either missing or presumed dead. Over 7,900 bodies had been disposed of. But on an average 30 to 40 bodies were being recovered every day.

Extensive damage has been caused to agricultural lands. Agricultural experts feel that it would take two years to remove the salinity and sand deposits from the fields. In Ersama, where some fields are still water-logged, embankments are being cut in order to let the saline water out. After the water is cleared, the fields would be flushed with fresh water diverted from canals. The damage caused to the irrigation system is estimated at Rs.350 crores.

Seeds of crop varieties are being sold to enable farmers to resume cultivation. In Jagatsinghpur district, the Agriculture Department is engaged in the task. Yet, farmers will find it difficult to restart agricultural operations as draught animals are in short supply. (The loss of livestock is estimated at 4.5. lakhs.) Although the government has made arrangements to procure cattle from elsewhere in Orissa as also other States, in Ersama it is exploring the possibility of putting to work tractors from servicing centres. With the loss of cattle, the siness has also suffered a major loss.

Employment generation through food for work programmes is a high priority. Jha said that labour-intensive projects are being formulated. In Jagatsinghpur district, 12 road-building projects, expected to take care of the needs of about 800 families, have been drawn up. But many people are not prepared to take up the jobs. "They are offering us a paltry sum of Rs.40 a day," complained one resident of Jagatsinghpur who was waiting for relief. ■

■ THE STATES

PRAVEEN SWAMI
in Srinagar

WHEN the sun goes down each evening, life throughout Kashmir retreats behind locked doors. After a gap of several years, an undeclared dusk-to-dawn curfew has been imposed in dozens of troubled rural areas in the State. In Srinagar itself, after sunset no civilian movement is allowed past the Badami Bagh Cantonment, located on the National Highway to Anantnag and on to Jammu. Checking of traffic along highways and cordon-and-search operations in the countryside have once again become common. And the tourists who had begun to holiday on the Dal Lake in the summer have all left.

In the aftermath of the Kargil War, the other war in Kashmir has been joined again in earnest. But the outcome of this war could well be shaped off the battlefield. The form and content of New Delhi's engagement with the All Parties Hurriyet Conference (APHC), and its management of Jammu and Kashmir's deep financial crisis (see separate story), could prove to have more long-term significance than the battles between Indian security personnel and insurgents that break out almost every evening.

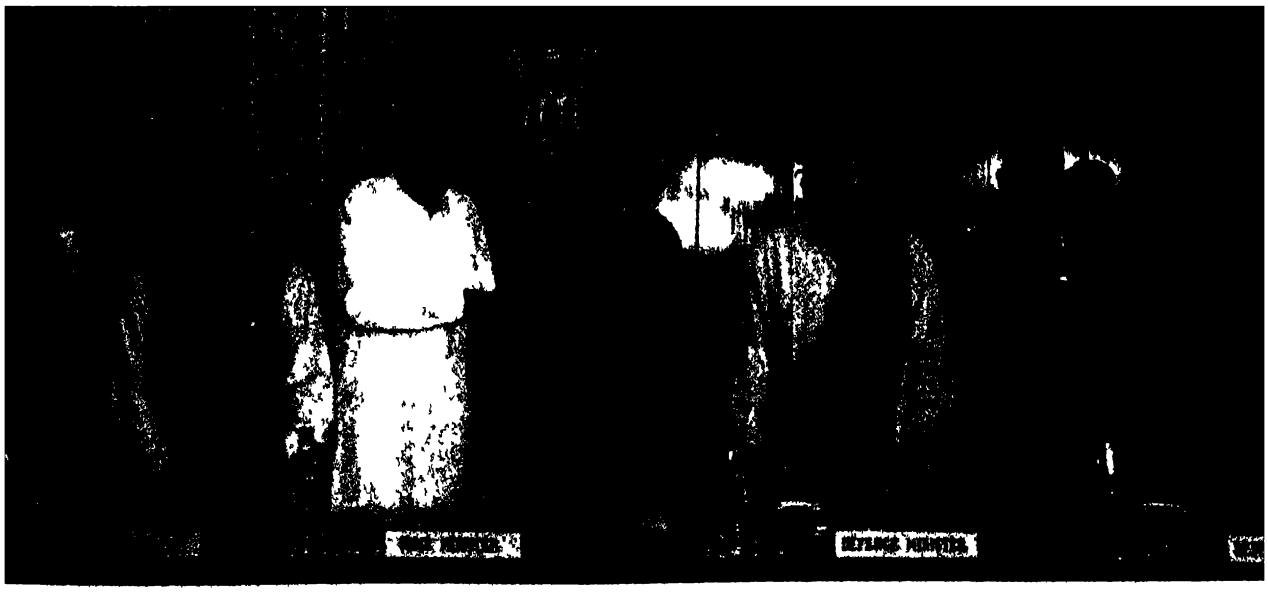
Rumours of covert official contacts with the APHC began shortly after the organisation's top leadership was jailed in October. The National Conference (N.C.) leadership allowed the APHC to conduct a vigorous anti-election campaign, expecting that low voter-turnouts would sabotage the prospects of former Union Home Minister Mufti Mohammad Sayeed's People's Democratic Party (PDP), and other Opposition figures like N.C. rebel Saifuddin Soz and the Communist Party of India (Marxist) leader Mohammad Yusuf Tarigami. With the elections out of the way, the N.C. promptly despatched top APHC leaders to jail on charges of complicity with terrorist groups and seditious activities. They are now lodged in Jodhpur.

Under other circumstances, the N.C. could have been sitting pretty in the knowledge that it had eliminated all its principal sources of opposition in one ingenious manoeuvre. But a powerful coalition of interests appears to have ensured that the move did not quite work out as planned. In late October, stories

An uncertain game plan

Is the Union Government making overtures to the APHC in a bid to reach an understanding with it on the Kashmir issue? And will this involve merely provincial autonomy or a partition of the State on communal lines?

began to appear in both State and national newspapers that a dialogue on Kashmir sponsored by the Union Government was under way. Such a dialogue, since it would undermine the N.C.'s claim to be the sole legitimate representative of mass opinion in Jammu and Kashmir, was thought to be initiated by forces within the National Democratic Alliance (NDA) Government that were hostile to the N.C.



Although the APHC has always formally rejected any possibility of a "dialogue with India", several events rendered credible the prospect of such a dialogue. During a visit to the United States in early October, APHC leader Abdul Ghani Lone had attacked Pakistan's Kashmir policy. Lone's remarks came in the context of proposals from the Washington-based Kashmir Studies Group for the creation of an autonomous region spanning the Kashmir Valley, and the Muslim-majority areas of Rajouri, Poonch and Doda. Many believed that Lone was responding to some kind of quasi-official U.S. proposal for a bilateral dialogue.

With APHC hardliners such as its Jamaat-e-Islami affiliated chairperson Syed Ali Shah Geelani in jail, events in November tended to lend legitimacy to this proposal. In a November 6 interview to *The Indian Express*, Lone ruled out bilateral negotiations, but then made an intriguing statement. India, he said, "had to give up the bullet-for-bullet policy and volunteer for a dialogue with the Kashmiris as they are doing in the north-east". "Only this," he concluded, "will enable us to prevail upon outsiders to keep off Kashmir." A fortnight later, the APHC's acting chairperson and an influential religious leader from Srinagar, Umar Farooq, came out even more explicity, suggesting an India-APHC dialogue with Pakistan "involved at a later stage".

Furore followed in the APHC. At its November 22 General Council meeting in Srinagar, APHC figures committed to securing Jammu and Kashmir's accession to Pakistan accused Umar Farooq of treachery. He, in turn, flatly denied that any talks had begun. Geelani, he said, had told him in Jodhpur on October 24 "swearing by the Holy Prophet that nobody from the Government of India had approached him until then". "My remarks need to be understood in the right context," Umar Farooq said. "India and Pakistan talk to each other, and we reject the talks at futile. But at the same time, the talks generate hopes of a settlement." In other words, Umar Farooq was clearly open to the prospect of bilateral discussions as a precursor to involving Pakistan, a stand remarkably similar to that Lone had taken.

New Delhi stood by through most of the drama, perhaps to see where events would lead. It was only on November 26 that Prime Minister Atal Behari Vajpayee called a meeting to discuss events in Srinagar What Union Home Minister L.K. Advani, Defence Minister George Fernandes, Cabinet Secretary Prabhat Kumar, Home Secretary Kamal Pandey, the Intelligence Bureau Director Shyamal Dutta, and Research and Analysis Wing chief A.S. Dulat discussed with him has not been made public. No Jammu and Kashmir Government officials were invited to the meeting, suggesting that informal contacts with the APHC could well have been discussed. Although Advani denies that any contact with the APHC has taken place, several observers believe that some kind of informal intelligence community contact could well have occurred.

Whether an official dialogue with the APHC has already started or is only being considered, its initiation would serve several interests. For one, officials in New Delhi, as well as a spectrum of politicians, make no secret of their belief that Chief Minister Farooq Abdullah's three-year

Jammu and Kashmir Chief Minister Farooq Abdullah with Home Minister L.K. Advani, Defence Minister George Fernandes and senior officials at a meeting on internal Security at North Block in New Delhi in November.

Cyberspace ravings

PRAVEEN SWAMI

THE Lashkar-e-Taiba's *jihad* is not being fought just in Jammu and Kashmir; the battle is also being waged in cyberspace. The message of hate of the ultra right-wing organisation, and that of its parent religious body, the Markaz Dawa wal'Irshad, is now just a few mouse clicks away – at www.dawacenter.com. With everything from theological articles to audio downloads of leaders' speeches, the Web site provides insights into the Lashkar's tactical objectives, and also the basis of its bloody ideology of hate.

Among the most important documents available on the site is Markaz founder Hafiz Muhammad Sayeed's speech to the group's congregation near Lahore on November 3. There, Sayeed clarified the Lashkar's viewpoint that "the *jihad* is not about Kashmir only". "About 15 years ago", the Markaz leader concluded, "people might have found it ridiculous if someone had told them about the disintegration of the USSR (Union of Soviet Socialist Republic). Today, I announce the break-up of India, insha-Allah. We will not rest until the whole (of) India is dissolved into Pakistan."

Sayeed promises a new war which will "encompass all of India including Junagarh, Mavadar (and) Hyderabad". The choice of the three has obvious significance, underlining as it does the distinctly sub-continental character of the Lashkar's Islam. An article on "*Jihad* in the Present Times" informs readers that in "India, if you recite aloud the Azan, the Hindus and Sikhs come to violence". "In India", the article asserts, "the Muslims are being slaughtered just because they profess Islam. Their property is plundered, their women are disgraced and molested and their mosques are razed to the ground."

Even if Bal Thackeray's anti-Muslim campaign and the demolition of the Babri Masjid both figure on the Lashkar Web site, the content is not centred exclusively on India. "In China, Russia, Albania and Yugoslavia," another article on *jihad* asserts, "millions of innocent Muslims were put to death." The article also refers to Muslims being butchered in Chechnya and Bosnia. Some of the Markaz less probable targets of hate include Spain, where "the Christians literally and practically wiped out the whole Muslim population". Here and elsewhere, "it is our duty to restore Muslim rule to this land of ours".

Several key tenets, in the Markaz view, make this duty binding on all Muslims. *Jihad*, an article asserts, is incumbent until the persecution of Muslims ends, and "the way of life prescribed by Allah dominates and overwhelms the whole of the world". "Fighting is also obligatory," it continues, "until the disbelieving powers and states are subdued and they pay *Jizya* (capitation tax) with willing submission". The recovery of property once ruled by Muslims, avenging historical atrocities against Muslims, and the defence of Muslims who are under attack are all projects which demand the participation of all believers.

Curiously, the United States, which had been for long a prime villain in Islamic chauvinist narratives, figures little on dawacenter.com. Sayeed's speech to the annual congregation mentions the country and President Bill Clinton just three times in the course of three pages of single-spaced text. One reference is to the U.S. failure to apply the same standards it used in East Timor to Kashmir, while the other two condemn that country's denunciation of the *jihad* as terrorism. If the Web site is anything to go by, the U.S. has little to fear from a terrorist organisation that emerged from its own Afghan policy.

Dawacenter.com is frankly dismissive of democracy. Discussing the military coup in Pakistan, Sayeed urges Gen. PervezMusharraf to impose martial law, with its basis of legitimacy a "divine constitution that nullifies all other constitutions". "Just like there can be no god but Allah," he asserts, "there can be no constitution other than the one given by (the) Quran. I challenge all the groups and organisations to prove (the) Quran not being the perfect constitution from Allah. Anyone who does so will be eliminated from the fold of Islam." It is easy to see why this authoritarian rhetoric, along with calls to end strikes and agitations, is attractive to some sections of Pakistani society.

Brutality is broadcast as a badge of honour by the Lashkar. One article on its Web site notes that the "Lashkar fighter will usually execute an (imprisoned) Indian soldier by slitting his throat". "However," the article continues, "beheading and disembowelling are also common methods, employed mostly for psychological reason(s). In at least one case, a Lashkar fighter, Abu Haibat, brought the head of an Indian soldier back with him to Pakistan." Such actions are legitimised, since Hindus are, in the Lashkar's world, invariably savages, rapists, or murderers, or all of these put together.

Hate propaganda is used to justify such tactics. "A Gorkha soldier received a message from home that his mother was seriously ill and might pass away," one fairly typical article records, "so he was asked to come soon. He went to his commanding officer and asked for leave, saying that he had to go to eat his mother's flesh. But he was not granted leave. On this, he gave his gun and pouch to Mujahideen and took some money in return and ran off. Brother Salamat Ullah told that they (Gorkhas) do not bury or cremate their dead but eat their flesh."

That the Markaz rhetoric is not just words is evident. Sayeed's call for a war against India, for example, has been mirrored in the arrest of Lashkar operatives from Hyderabad, Bhiwandi and several locations in Uttar Pradesh and Haryana. While dozens of Web sites peddle hatred on behalf of demented Hindu, Muslim and Christian sects, what is most disturbing about the Lashkar's cyberspace ravings is that they clearly have some official sanction from Pakistan. The annual congregation was carried out with General Musharraf's express blessings, overturning efforts by deposed Prime Minister Nawaz Sharif to stop it.

It is easy to dismiss the Lashkar-e-Taiba's rantings, thin on fact and often founded on lurid fantasy, as beneath contempt: indeed, there is no great distance between its content and pamphlets about Muslims routinely put out by Hindu fundamentalist organisations. But the fact remains that the organisation has grown rapidly in recent years with the patronage of the Pakistan state apparatus, and is now the largest terrorist group in Jammu and Kashmir. What dawacenter.com has done is to make the content of Lashkar struggle available on the Web, and underline the importance of this fascist crusade. ■

A financial crunch

PRAVEEN SWAMI

IF, in metaphorical terms, the road to peace in Jammu and Kashmir is riddled with potholes, an economic crisis has ensured that its highways are not in any better shape in the physical sense. All but the most token development activity, mostly in the form of a few central government schemes, has come to a halt. And if something is not done to solve the problem soon, says Chief Secretary Ashok Jaitley, things will get worse. He said: "After February, we will be unable to repay debts, or give government employees their salaries."

The problem is straightforward. There is this year a gap of some Rs.1,200 crores between revenue and expenditure. Of this, Rs.550 crores is needed for pay hikes prescribed by the Fifth Pay Commission, and another Rs.675 crore is accounted for by losses from electricity supplies. The State has taken an overdraft of Rs.950 crores from the Jammu and Kashmir Bank, on which it is paying interest at rates ranging from 14 per cent to 17 per cent annually.

The State also has several additional liabilities imposed by its special security-related circumstances, which it wants the Union Government to meet. Since 1988, Rs.300 crore has been paid out in salaries to the Kashmir Pandit employees who left their jobs in the Kashmir Valley and are living elsewhere. And another Rs.400 crore has had to be paid to employees of public sector units in the State which closed down amidst the violence.

State Government officials argue that the problem is not one of their making. The overdraft, for example, rose from Rs.80 crores in 1989-1990 to Rs.650 crores in October 1996, when the National Conference came to power. Then, State Government employees were granted salary parity with their Central counterparts in 1992, when Governor's Rule was in place. "I'm not saying that we haven't contributed to the problem," says Jaitley, "but when New Delhi says this is a crisis of our own creation, it's just not true."

The Chief Secretary points to loss-making public sector units as an example. For ten years, when this government was not in power, people weren't made to pay their bills. Jammu and Kashmir has hiked power tariffs three times in three years, more than any other State in the Union Consumers are reluctant to pay, in part driven by habit, but also because supplies remain unpredictable and voltage is erratic. Supplies cannot be improved until the State can buy more electricity, which it can do only if it receives aid.

UNION Finance Ministry officials, however, insist that the Jammu and Kashmir Government can do more than it has been doing in order to ensure efficiency and end corruption. The report of the Comptroller and Auditor General of India, presented in October 1999, is a depressing chronicle of just how endemic financial mismanagement and outright fraud are in the Jammu and Kashmir Government. The State Government did not help its own case by refusing to share, during earlier negotiations, accounts for security-related expenditure, a move which fuelled suspicion in New Delhi.

Incidents such as the recent crash of a State Government helicopter, which will cost some Rs.22 crores to replace, have not helped matters either. It turned out that the helicopter was flying without insurance cover, carrying private visitors to the State on a pleasure trip. Even the pilot's professional credentials have come under question. And Farooq Abdullah's decision to spend some Rs.50 lakhs on improving the facilities of Srinagar Golf Club at a time of financial hardship has not won the Chief Minister many friends.

State Government officials believe that New Delhi will help Srinagar tide over the immediate Rs.1,200 crore-deficit, and claim to have Union Finance Minister Yashwant Sinha's support for this. But a short-term bailout will not solve the central problem of poor revenues. Sharp increases in excise levies and taxes have already fuelled widespread protests, and further increases on this front seem improbable. Recommendations for a drastic downsizing of the bureaucracy and public sector units, made by an official committee headed by Madhav Godbole, do not appear politically workable either.

One solution being discussed is for a dramatic increase in Jammu and Kashmir's huge hydroelectric capacity, which would make it possible for the State to sell power. Officials in New Delhi had been reluctant to grant counter-guarantees for four proposed projects, pointing to the somewhat opaque credentials of the State Government's proposed overseas collaborators. Matters appear to be progressing on this front, with proposals having been put out for the projects to be jointly managed by the Jammu and Kashmir Power Development Corporation and the National Hydro Power Corporation. Revenues from such projects, however, are obviously some distance away.

MEANWHILE, Jammu and Kashmir is demanding that its status as a Special Category state, as designated in 1990, be given retrospective effect. In the case of Special Category States, 90 per cent of their Central assistance is treated as grant, and the remaining 10 per cent as loan. Until 1990, Jammu and Kashmir received just 30 per cent of its assistance as a grant. Special Category status was granted to other States in the mid-1970s, and the demand for Jammu and Kashmir to be given the status with retrospective effect was endorsed by the Assembly. It unanimously passed a private member's bill moved by CPI(M) leader Mohammed Yusuf Tarigami.

Whether any assistance will materialise at all, however, is unclear. The Bharatiya Janata Party MP for Udhampur, Chaman Lal Gupta, has been insisting that the National Democratic Alliance Government will not underwrite inefficiency, and Union Home Minister L.K. Advani announced on November 31 that no special package had been framed for the State. Chief Minister Farooq Abdullah's Government has been no model of economic competence, but it is also clear that its problems are neither unique to the State nor all of its own making. Should Jammu and Kashmir be made hostage to the BJP's factional compulsions, its consequences are certain to be more serious than those that any number of Lashkar-e-Taiba terrorists can impose. ■

reign has undermined the gains made in 1996. There is unanimity here about the poor administration and the corruption, but as an alternative, no viable Opposition is in sight. Starting a dialogue with elements within the APHC would, at least, open the prospect of some secessionist leaders joining mainstream politics. This should enable the NDA Government to meet U.S. pressure by proclaiming that dialogue has been opened with representative leaders of Kashmir.

BUT it is far from clear whether a formal dialogue with the APHC could in fact come into being. Most APHC leaders have historically shown little inclination to seek confrontation with terrorist groups, who are certain to be incensed by any bilateral dialogue. In September, Umar Farooq condemned Hizbul-Mujahideen demands for the termination of all cable television services in Srinagar, suggesting cautiously that educational and news broadcasts were not un-Islamic. The Hizbul-Mujahideen promptly issued press releases virtually asking the religious leader to mind his own business. Subsequently, Umar Farooq failed to condemn the murders of at least four cable network operators in Srinagar city.

More important, it is near certain that major Pakistan-based terrorist organisations such as the Lashkar-e-Taiba and Harkat-ul-Jihad Islami would in fact ignore calls by the APHC for an end to violence, an important component of any dialogue. Nor is it clear whether Hindu chauvinists within the Bharatiya Janata Party (BJP), and the party's rank and file in Jammu, would allow any kind of autonomy negotiations with the APHC to proceed. "There is this enormous optimism among communalists in Kashmir and Pakistan," said academic Balraj Puri, "that the BJP's Hindu credentials would enable it to sell some kind of deal on Kashmir." "In fact," he argued, "the BJP's core Hindu nationalist beliefs and its internal factional disputes make it near impossible for a deal on Kashmir to come about."

Alternative deals appear more probable. The State government's plans to partition Jammu and Kashmir into a series of provinces along communal lines, Puri suggested, could dovetail with its demands for greater State autonomy. "You might see," Puri said, "the Union Government granting autonomy to the Kashmir valley, Rajouri, Poonch, Doda and Kargil in return for a greater integration into the Union of the predominantly non-Muslim areas of Jammu, Leh and Udhampur. Such a deal could be packaged as meeting the separate aspirations of religious communities throughout the State." Such an autonomy deal would not only meet U.S. demands for progress in the Kashmir Valley, it would also allow the BJP to keep Hindu hardliners quiet.

The proposition is not as bizarre as it seems. Politics in Jammu and Kashmir is built around three forces, each legitimising the existence of the other. Should a partition of the State come through, the BJP would secure its ranks in Jammu, the N.C. could proclaim victory for its core Kashmiri Muslim constituency, and the APHC could continue with its anti-India platform undisturbed. Leh has seen massive anti-autonomy protests through late November, and BJP Member of Parliament Chaman Lal Gupta has been letting his Jammu region constituency know that the Union Government will under no circumstances allow the N.C. demands for Statewide autonomy to be put in place. Such protests could propel the case for partition.

THERE is little doubt that the security establishment within the State has recovered from its early post-Kargil reverses. Despite high losses of security force personnel, terrorist groups have also been hit hard by operational reverses and internal fissures. Intelligence officials told *Frontline* that Pakistani insurgents bitterly accused their Kashmiri counterparts of collaboration with security force personnel, at a meeting held at Cheripora village near Chattergul in Anantnag on the night of November 10. One relative of local Hizbul-Mujahideen military adviser Nadeem Osmani was subsequently executed on charges of being an informer.

But the new political processes set in play inside or outside Jammu and Kashmir have ensured that despite these military gains no one is certain just where events might go from here. Sadly, most politicians appear fixated on this high-level political dialogue, ignoring the fact that ordinary people have lives to live in the meanwhile. "Politicians," said CPI(M) leader Tarigami, "spend their time talking about three-nation formulas and ten-nation formulas. Meanwhile, people do not have access to clean drinking water, and their children aren't getting an education." If the Union Government is in fact serious about Jammu and Kashmir, it might to do well to address the problems of its people as well. ■

■ THE STATES

KALYAN CHAUDHURI

THE spectre of killings has returned to haunt south Bihar, where extremist groups are engaged in a war for supremacy. In one of the worst carnages in Palamau district, 12 members of a family were killed in Loto village, 42 km from Daltongunj, the district headquarters. The assailants belonged to the outlawed Maoist Communist Centre (MCC) and the victims were sympathisers of another underground ultra-Left organisation, the People's War. The People's War was formed early this year through the merger of the Communist Party of India (Marxist-Leninist) Party Unity and the People's War Group (PWG).

It was around midnight, when about 100 MCC activists surrounded the house of Abdul Gafoor, 60, a prosperous farmer, After sealing all escape routes, they attacked members of the family: they slit the throats of Gafoor, his wife, one of their sons, two daughters-in-law and seven grandchildren aged between three and seven.

It was 24 hours later that the police came to know of the incident. Loto, located in the Chhotonagpur foothills, is surrounded by dense forests. The police said that since Gafoor's house was on the outskirts of the village, nobody had come to know about the operation immediately after it. The news reached the nearest police station of Chattarpur, 15 km from Loto, after a local social worker, Kameshwar Baitha, and 25 others visited the thana the following day.

Director-General of Police K.A. Jacob, who visited the spot along with Chief Minister Rabri Devi and Rashtriya Janata Dal (RJD) president Laloo Prasad Yadav on November 20, said that the Loto massacre was probably the worst episode in the conflict between the two organisations. The Chief Minister ordered a probe into the killings and announced an ex-gratia of Rs.12 lakhs to the two surviving sons of Gafoor, who were in Mumbai at the time of the incident.

The authorities believe that the murder of an MCC activist in a nearby village sparked the incident. The area around Loto is a People's War stronghold, and the MCC is trying to get a foothold there. Informed sources said that Gafoor had sheltered People's War activists during the Lok Sabha elections,

Another carnage in Bihar

In the continuing war for supremacy in south Bihar between ultra-Left organisations, 12 members of a family are killed in Loto village of Palamau district.

when the battle between the two organisations had intensified

The Bihar unit of the Bharatiya Janata Party blamed the State Government for the massacre. Party leader Sushil Kumar Modi, the Leader of the Opposition in the State Assembly, demanded the resignation of Rabri Devi. The Loto incident, he alleged, had proved that the minorities were not safe under her rule.

MEANWHILE, Jehanabad district lived up to its reputation for rivalry between naxalite groups. Three activists of the Communist Party of India (Marxist-Leninist) Liberation were gunned down by People's War members on November 22 at Ramdeo Chowk in Karauna police station limits. The victims were landless labourers belonging to a backward caste.

Informed sources said that revenge was the motive behind the killing. Kunal, district secretary of the CPI(ML) Liberation, told *Frontline* that the victims were 'active members' of his organisation. He said that the People's War was trying to terrorise CPI(ML) Liberation supporters. He alleged that the People's War was serving the interests of the RJD. "There appears to be a calculated attempt to terrorise voters who supported us in the last elections," he said.

Even before the elections, violence was a regular occurrence in Jehnabad district and some adjoining blocks of Patna district. At least 15 people were killed in Masaudi block of Patna district between July and August as these ultra-Left organisations fought an open war. With the Assembly elections just three months away, these organisations are preparing for a fresh show of strength. The police have arrested some MCC activists, however, the extremists continue to run a parallel administration in remote areas. The MCC has announced a "hit list", and the Jehnabad unit of the People's War has responded to this with one of its own. The People's War list includes the names of 18 MCC activists who have 'strayed from the revolutionary path". The People's War has vowed to "eliminate them. In contrast to the MCC's style, the People's War has resorted only to selective killings so far.

PALAMAU is the most disturbed region in Bihar. There are two approach routes to Daltonganj from the Grand Trunk Road: one from Sherghati via Imamganj and Lesliegunj and the other from Aurangabad via Chattarpur. The road from Shergghati cuts through areas liberated by the MCC and is kept in a state of disrepair in order to keep the police off. Incredibly beautiful though one of the poorest districts in the State, Palamau is dotted with granite hills, green valleys, streams and forests. Devoid of irrigation (the North Koel and the Koel Karo projects have been in limbo for years), the people survive on subsistence cultivation. The southern forests are populated by tribal people, who gather honey and practise slash and-burn cultivation. Starvation deaths are recorded every year here.

Mass poverty in Palamau and the neighbouring Chatra district forms the basis of MCC-led extremism in the region. Widely believed to have been initially funded by Laloo Prasad Yadav in order to counter the CPI(ML) Liberation, the MCC set up underground bases in south Bihar.

The story of the CPI(M-L) goes back to 1967. Until then no Dalit or a member of any backward community was allowed by upper-caste landlords to vote. In the 1967 elections, a young social activist of Bhojpur, Jagadish Master, took Dalit voters to a polling booth at Ekwari. He was brutally beaten by upper-caste Bhumihars. Jagadish left the village, only to return as a leader of the CPI(M-L). For the next 20 years, the CPI(M-L) built up cadres among the landless workers and marginal farmers among Dalits and selectively liquidated prominent Bhumihars and Rajputs. The CPI(ML) Liberation, which believes in Charu Mazumdar's theory of class struggle, rejected the path of underground operation and 'individual killing' in 1994. Since then it has been organising militant mass movements of landless agricultural workers in rural Bihar. The late Vinod Mishra was one of its founders.

In course of time the MCC became more active in south Bihar. It is now a force to reckon with in Gaya, Aurangabad, Chatra and eastern Palamau. Called the Party in the liberated zones, it organises people's courts, collects taxes from wealthy villagers and levies fees on mining and kendu (bidi) leaf contractors. The MCC has four adversaries – the CPI(M-L) Liberation, the police, the wealthy peasants and now the People's War. Landlords have fled the region.

IN their fight for supremacy in rural Bihar, the MCC, the CPI(M-L) Liberation and the People's War have often fought bloody battles among themselves. In September 1998, the CPI(M-L) clashed with the MCC in Aamkudar, a village on the border between Chatra and Palamau districts. Eleven CPI(M-L) Liberation activists were killed and several others wounded.

Not all these battles are fought for ideology. In Aamkudar, it is reported that the MCC was 'gifted' 30 bighas (10 acres or four hectares) of land by a landlord in order to exterminate CPI(M-L) activists who encroached on his landholding. Since 1997, the MCC has targeted the police fre-

quently in order to seize arms and ammunition. The first attack on the police occurred in May 1997 on the Kandi picket in Garhwa district to the west of Palamau. In the past one year, three ambushes have taken place in the Palamau region – at Thakurai Dabra (near Lesliegunj), at Nawa Jaipur and at the Humbu picket

An uneasy calm prevails in several villages of Palamau and Garhwa districts, which are caught in the crossfire of extremists rivalry. The MCC beat up some time ago some residents of Akabasa village for having entertained members of the People's War. The People's War would have meted out similar treatment to the villagers had they refused them food and water. Either way they are in a no-win situation. "If we attend the meeting of one party, the other will punish us. We are penalised even for not attending a meeting," a peasant told a police team that visited Loto.

Palamau Superintendent of Police N.K. Azad told *Frontline* that the extremists' battle with the landlords was almost over. "Not only the rich, even Dalits and members of the oppressed communities in Palamau and Garhwa find themselves caught in the tussle between the two groups. Both the groups want to establish their dominance over the region, which is of strategic importance. The forests that connect this area to Madhya Pradesh are used for the supply of ammunition," he said. Azad pointed out that these groups collected from the region large sums of money by way of "taxes" on a variety of businesses.

Local Communist Party of India (CPI) leader Shailendra said: "More Communists died in the MCC-People's War-CPI(M-L) Liberation conflicts than in the fight with landlords." He claimed that more than 40 people had been killed since January.

Members of the People's War, however, insist that their conflict with the MCC is "not just about territorial domination or levy". They allege that a good number of activists of the landlords' private army, the Sunlight Sena, which is locked in a battle with the People's War, have joined the MCC after landlords were humbled by the naxalite group. MCC leaders, however, refuted these charges. Informed sources said that the animosity between the two groups had increased after the MCC backed an upper-caste Rajput landlord of Punki in the 1995 Assembly elections. ■

Merry-go-round Ministries

In Goa, Francisco Sardinha leads a breakaway group from the Congress(I) and clambers to power with the support of the Bharatiya Janata Party.

RAVI SHARMA

POLITICS in Goa, one of India's "youngest" States, is characterised by a remarkable degree of instability. Since elections to the 40-member Assembly were first held in 1989, the State has had 10 governments. Over these years, newer and stranger political formations have evolved successively in the State; more often than not, allegiances have been determined not by political or ideological considerations but by rank opportunism. On occasion, even leaders whose politics is motivated by undiluted self-interest (and nothing else) find it prudent to camouflage their political ambitions. However, the forces that brought down last fortnight the five-month-old Congress(I) government headed by Luizhinho Faleiro felt no such need: they stated categorically that their actions were motivated solely by the desire for "ministerial posts".

The Faleiro Government, which was elected to power in June, was reduced to a minority when 11 of the 26 Congress(I) MLAs broke away from the party on November 19. Following this dramatic development, the Governor, Lt.-Gen (Retd) J.F.R. Jacob, asked Faleiro to secure a vote of confidence from the Assembly by November 24. Faced with the prospect of defeat, Faleiro resigned on November 24.

Within hours, an alternative government was in place. It was formed by the Goa Democratic Alliance, a coalition led by breakaway Congress(I) leader Francisco Sardinha (who was Revenue Minister in the Faleiro Government) and including the Bharatiya Janata Party, the Maharashtrawadi Gomantak Party (MGP), the Nationalist Congress Party (NCP) and an independent.

In the last decade, the terms of two Chief Ministers – Pratapsinh Rane and Ravi Naik – together accounted for six and a half years; others have been in power for periods ranging from 11 months to six days. (Rane and Naik have served as Chief Ministers twice. Dr. Wilfred DeSouza did one better; he has been sworn in thrice.)

Rebellions within the ruling party of the day led by disgruntled leaders have brought down every one of Goa's governments since 1989. In almost all cases the rebel leaders were rewarded either with the chief ministership or with ministerial posts. Most, if not all, of Goa's leaders have switched political loyalties at least once. Among them, Deputy Chief Minister Dayanand Narvekar holds a record of sorts: he began his career with the MGP and later gravitated to the Congress(I). Subsequently he left and rejoined the Congress(I) on numerous occasions, and each of his moves resulted in the unseating of a Chief Minister, Faleiro being the fourth. Subhash Shirodkar and Somnath Zuwarkar have switched loyalties thrice, and Mauvin Godinho twice (all three are Ministers in the new dispensation).

As many as eight governments were made or unmade by defections to and from the Congress(I). Of these, five were Congress(I) governments; three, including the latest, were formed by coalitions led principally by leaders who broke away from the Congress(I) and were supported by other parties.

For the Congress(I), trouble from dissidents cropped up even in its moment of triumph. The party won 21 of the 40 Assembly seats in the June elections. The high command chose Faleiro, who as State Congress(I) president led the party to victory, to head the government. There were at least five other aspirants for the post, including three former Chief Ministers and two senior leaders. Each of them was appropriately rewarded: Rane was elected Speaker and the others were made Ministers.

The high command also insisted – in keeping with a commitment in the election manifesto – that the size of the Ministry be restricted to 15 per cent of the strength of the Assembly. Thus, the Faleiro Ministry had just six members. This was a recipe for instability.

In an attempt to bolster its slender majority, the Congress(I) sought to win over the support of legislators from smaller parties and by offering them positions of power. In July, two legislators of the United Goans Democratic Party (of which Faleiro himself was once a member) defected to the Congress(I), and one of them was made a Minister. In August, a faction of the MGP, headed by Ramakant Khalap, merged with the Congress(I), adding two more to the Congress(I)'s numbers in the Assembly. Khalap was rewarded with the party nomination for the parliamentary elections; Prakash Velip, the other, was accommodated in the Ministry. In early November, Francis D'Souza defected from the NCP to the Congress(I), taking its strength in the Assembly to 26. D'Souza, however, did not spend too much time in the Congress(I): he was one of those who broke away with Sardinha on November 19.

BY SPECIAL ARRANGEMENT

Governor Lt.-Gen. J.F.R. Jacob administering the oath of office to Francisco Sardinha in Panaji on November 24.

However, sources close to Faleiro said that the Chief Minister had been unable to "work out things on his own terms" with local leaders of the Congress(I) owing to the restrictions imposed by the high command. "Every decision had to be vetted by the high command," these said.

Faleiro told *Frontline* that running a government with just five Ministers was an agonising experience. "It was a tightrope walk, since there were so many aspirants. There were as many as 14 former Ministers in the Congress(I) Legislature Party." He conceded that he had later been allowed to induct five more members in his Ministry, but said that dissidence had set in by then. "Sardinha revolted in July itself, hardly 25 days after we took office. I faced four attempts to oust me."

Faleiro claimed that his government had been pulled down because he had unearthed "the lottery scam of the century", which had entailed a revenue loss of crores of rupees. He alleged that the "lottery mafia" had induced some CLP members to defect.

Faleiro said: "When I took over I discovered that a company had, without taking part in a competitive bid, secured the contract to print and distribute State lottery tickets. The company had assured a minimum return of Rs.60 lakhs and a maximum of Rs.3 crores (including unclaimed winnings) to the State. I cancelled the contract and called for a re-tender. The same firm re-tendered through another front company, only this time the minimum amount assured was much higher. The State had been losing revenue in the business for years. There was tremendous pressure on me not to go in for a re-tender. Many of those who opposed my move are today in power."

Faleiro criticised the breakaway Congress(I) leaders for "going for the crumbs" and for going on "an illegitimate and unethical honeymoon" with the BJP. He accused the BJP of "hatching a conspiracy to destabilise a duly elected Congress(I) Government."

THE Congress(I)'s loss in Goa has translated into a major gain for the BJP, which made its political debut in the State barely five years ago. Taken with the party's victory in the North and South Goa parliamentary seats, the latest developments have rendered State BJP leaders jubilant. Gaining a toehold in Goa, a citadel of the Congress(I), has for long been the BJP's ambition. In July 1998 the BJP came close to sharing power with its alliance partner, the MGP, but its central leadership vetoed the proposal from the State unit; in the end, the BJP supported from outside the government headed by Wilfred DeSouza.

Ahead of the Assembly elections in June, the BJP severed its alliance with the MGP under pressure from the State unit. The Congress(I) gained from this development, and the BJP lost a near-certain chance to come to power. The BJP emerged as the main Opposition party, with 10 members.

According to Manohar Parrikar, BJP leader in the Assembly, the decision to go it alone in the Assembly elections paid off in the parliamentary elections, with the BJP winning both the seats. Parrikar was in favour of the BJP joining the Sardinha Ministry in order to render it stable. After debating the State unit's proposal, the central leadership decided to join the government, which includes leaders against whom BJP legislators themselves had levelled allegations of corruption and nepotism in the recent past.

Three BJP MLAs have been inducted into its Ministry, and more are likely to be accommodated. The promise in the BJP's election manifesto for Goa – that the size of a BJP ministry would be no larger than 20 per cent of the Assembly strength – has already been cast aside.

For the Congress(I), the loss of a State government to a coalition comprising the BJP has been particularly galling. Furthermore, its claim to being the only political entity capable of providing stable governments has taken a beating following the fall of the Faleiro government, which had a majority, however slender.

The Congress(I)'s loss also reflected badly on party president Sonia Gandhi's political skills and ability to deal with intra-party problems in States ruled by the party. Until the very end, she had expressed confidence that the government would survive the vote. In an effort to save the government, two emissaries were sent in quick succession to Panaji. But the inducements they offered – ministerships for all rebels and the promise that Faleiro would be replaced with a candidate acceptable to both sides – evidently did not go far enough for the rebels. The Congress(I), however, was not prepared to accede to Sardinha's demand that he be made Chief Minister.

The Sardinha government won a vote of confidence in the Assembly on November 30 by 25 votes to 14. Even so, the political situation appears to be far from stable. Observers feel that given the rough-and-tumble nature of Goan politics and the fickle nature of the political allegiances in the State, more permutations and even stranger combinations may be in the offing. ■

Madhya Pradesh manoeuvres

In Madhya Pradesh, dissident leader and Deputy Chief Minister Subhash Yadav exposes his own political weakness in attempting to organise a political protest aimed at Chief Minister Digvijay Singh.

V. VENKATESAN
in Bhopal

AT Kalghat in Madhya Pradesh's Dhar district, where the Narmada originates, the river is placid. For former Deputy Chief Minister Subhash Yadav, who hails from the Nimad region in Khargone district, which is only a few kilometres away, Kalghat appeared to be the right place to stage a protest. Situated on the Agra-Mumbai road, it is a key point between northern India and the country's business capital. On November 22, the Madhya Pradesh unit of Subhash Yadav's Bharat Krishak Samaj organised a four-hour blockade of the road at Kalghat, in order to prove his clout. Subhash Yadav was excluded from the Digvijay Singh government after last year's Assembly elections.

M. LAKSHMANAN

Chief Minister Digvijay Singh.

The protest turned out to be a damp squib, for the administration diverted traffic through other routes. There was no traffic jam at Kalghat, and so the success of the agitation can possibly be measured only in terms of the number of people who came to Kalghat to attend the public meeting. Although the organisers expected around 70,000 farmers to participate, media and police esti-

'Subhash Yadav raises issues, then forgets about them'

Interview with Digvijay Singh.

Madhya Pradesh Chief Minister **Digvijay Singh**, who on December 1 completed six years as Chief Minister, thus becoming the longest serving Chief Minister of the State, is not unused to factional struggles, having successfully handled intermittent challenges to his leadership from within the Congress(I) during his first term in office. However, on the issue of dissidence he apparently expected from Sonia Gandhi an approach that was different from that of her predecessors, many of whom had at one time or the other supported party rebels. Until the September-October Lok Sabha elections, she had backed Digvijay Singh completely and recognised his contribution to the party's victory in last year's Assembly elections. In an interview to **V. Venkatesan**, the Chief Minister relies to the charges that have been levelled against him, and speaks about the party's performance in the Lok Sabha election. Excerpts:

▶ *How do you respond to the issues raised by Subhash Yadav?*

Take the issue of soyabean prices. Since the Government of India imported cheaper edible oil, the prices crashed. Consequently, the price of oilseeds also crashed. There has also been a very steep fall in their prices in the international market. I wrote to Prime Minister A.B. Vajpayee in August, saying that soyabean prices would crash because the import duty on soyabean had been reduced. Because of the drop in import duty, edible oil prices crashed, and as a consequence, oilseed prices, particularly the price of soyabean, also crashed. I said, you must restore it. If the Centre increases the excise duty on imported edible oil, the mandi rates of soyabean in the State will increase and the farmers will get better returns. But the Centre did not intervene.

The Centre has announced the support price for yellow soyabean at Rs.845 per quintal and that of black soyabean at Rs.755 per quintal. Last year only 4,000 tonnes of soyabean was procured by paying support price in the State. Earlier, the rates of soyabean in the open market were higher than the support price and the State never procured more than 4,000 tonnes of soyabean on support price.

If we consider the economic viability of soyabean under these circumstances, and the minimum support price announced by the Centre, how can we procure at higher prices? Who will bear the losses? The State government cannot bear the loss, which is estimated at Rs.50 crores.

Because of the erratic monsoon, the quality of soyabean took a beating. Hence, we urged the Centre to relax the grade specification norms in order to enable us to buy soyabean of a lower quality too. Despite this, we have purchased more than 50,000 tonnes. Maharashtra and Rajasthan have purchased less than this.

The second issue Subhash Yadav has raised is power supply to rural areas. It is not possible. When he was Minister for Agriculture, Irrigation and Cooperation, he was a party to the decision that there will be power cuts because of various constraints. He knows it is not

mates placed the strength of the crowd between 8,000 and 15,000. Not surprisingly, Subhash Yadav's critics in the Congress(I) were pleased that the protest had exposed his limited base in the State.

SUBHASH YADAV, a follower of former Chief Minister Arjun Singh, was the latter's choice for the post of Chief Minister in 1993 when the Congress(I) won the Assembly elections. Digvijay Singh, however, outmanoeuvred Arjun Singh and became Chief Minister. Subhash Yadav was made Deputy Chief Minister. After the Assembly elections last year, Digvijay Singh kept him out of the Cabinet for a variety of reasons.

During his tenure as Deputy Chief Minister, Subhash Yadav was a source of embarrassment to Digvijay Singh. An Other Backward Classes (OBC) leader, he was egged on by leaders from the State such as Arjun Singh, Kamal Nath and Madhavrao Scindia to organise dissent against Digvijay Singh. Despite being the second-in-command, he criticised Digvijay Singh's policies and decisions on several issues. Besides demanding the

A.M. FAROOQUI

Former Deputy Chief Minister Subhash Yadav.

imposition of total prohibition, he urged a ban on peoples movements, such as the one led by the Adivasi Mukthi Sangathan, for the welfare of the tribal people in the Nimad region. He said the Sangathan was a naxalite organisation. Meanwhile, several allegations of corruption in the cooperative sector, which was under Subhash Yadav, were made. Digvijay Singh dropped him from his Council of Ministers. He kept open the issue of re-inducting Subhash Yadav in his Ministry but made it clear that he was aware of the fact that Subhash Yadav was raising issues of concern to farmers only to embarrass him, especially after the party's poor showing in the Lok Sabha elections.

Digvijay Singh came under attack from within the Congress(I) for the rout in the Lok Sabha elections after a victory in the Assembly elections. Party stalwarts such as Arjun Singh, Kamal Nath, Vidya Charan Shukla and Shyama Charan Shukla and party spokesperson Ajit Jogi are seeking to pin the blame on Digvijay Singh. (The A.K. Antony Committee, which reviewed the party's performance in the Lok Sabha elections, visited Bhopal to interact with the legislators.)

While Digvijay Singh has attributed the party's poor performance to the "Atal Behari Vajpayee factor", Subhash Yadav has placed the blame on Digvijay Singh's "anti-farmer policies". Subhash Yadav,

possible.

He wants paddy to be purchased immediately. Efforts have already started in this direction. He wants the mandi tax to be raised from 50 paise to one rupee. When I took the decision to reduce the tax, it was under the premise that the lower the tax, the more honest the system. When I reduced the tax, I categorically said that if there was a fall in revenue, I would raise it again. So, now, we are reviewing the decision and we will raise the tax again.

Then, he wants the professional tax to go. He was a party to the decision on levying professional tax in Madhya Pradesh. We are getting a revenue of Rs.110 crores from this. How can we let it go? We are not taxing poor people. There is exemption for those with an annual income of up to Rs.40,000. Farmers are not being taxed.

▶ *Why are you not ready to discuss these issues with Subhash Yadav?*

In fact, I did discuss these issues. I called a meeting on November 15. He came. I sat down with him. All my officers and Ministers were there. I said these are the problems with regard to soyabean. He said, 'but your intentions are not good!' (Laughs) How can I answer this?

▶ *How do you react to his claim that he has the support of senior leaders?*

Well, no leader has openly said that he supports him. People say that they are doing it surreptitiously. But I don't think so.

▶ *Subhash Yadav says that a change of leadership is not part of his agenda now.*

I thank him very much. All these issues are open for discussion. We called him to discuss the issues at the PCC (Pradesh Congress Committee) executive. He refused to come. He lacks consistency. He raised the issue of spurious fertilizers and pesticides when he was Agriculture Minister. He blacklisted some firms, but didn't do anything about it afterwards. Then he took up the issue of illegal allotment of plots in a housing society. He did not pursue that issue either.

Then he raised the issue of prohibition. I made him the chairman of the Cabinet sub-committee enforcing prohibition. For three years, he did not submit a report. He identifies problems and issues, and then forgets about them. During the last five years, he has been consistently raising issues. But he does not take them to the logical end. My friendship with him is far more deeper than these mundane issues. In our relationship over the past several decades, many such issues have cropped up. But we became friends again.

▶ *You have attributed the Congress(I)'s debacle in the Lok Sabha elections to the "Atal wave". But you take credit for an increase in the total number of votes polled by the Congress(I). Is there a contradiction in these positions? Could you convince the Antony committee about this?*

In Andhra Pradesh, Orissa, Bihar, Gujarat, Rajasthan and Maharashtra, our vote share has gone down. In Uttar Pradesh, it has gone up, because it couldn't go lower than the level at which it was in 1998. So, in all the States where the Congress(I) was in power, the party's vote share went down – except in Madhya Pradesh.

▶ *When you talk about the "Atal factor", is there an admission that the "Sonia factor" did not work?*

People talk about negative points. It was because of Sonia Gandhi that our vote share went up. We could, however, not bring down the BJP's vote share.

▶ *Because Sonia was no match for Atal Behari Vajpayee?*

You may say that. But I do not say that. On the contrary, because of Sonia our vote share has gone up in the entire country. But we got fewer seats because of the vagaries of our electoral system. ■

A M FARUQUI

***Shiksha karmis* – teachers appointed under the Education Guarantee Scheme of the Rajiv Gandhi Mission in Madhya Pradesh - went on a protest demonstration in Bhopal on November 25 demanding government jobs.**

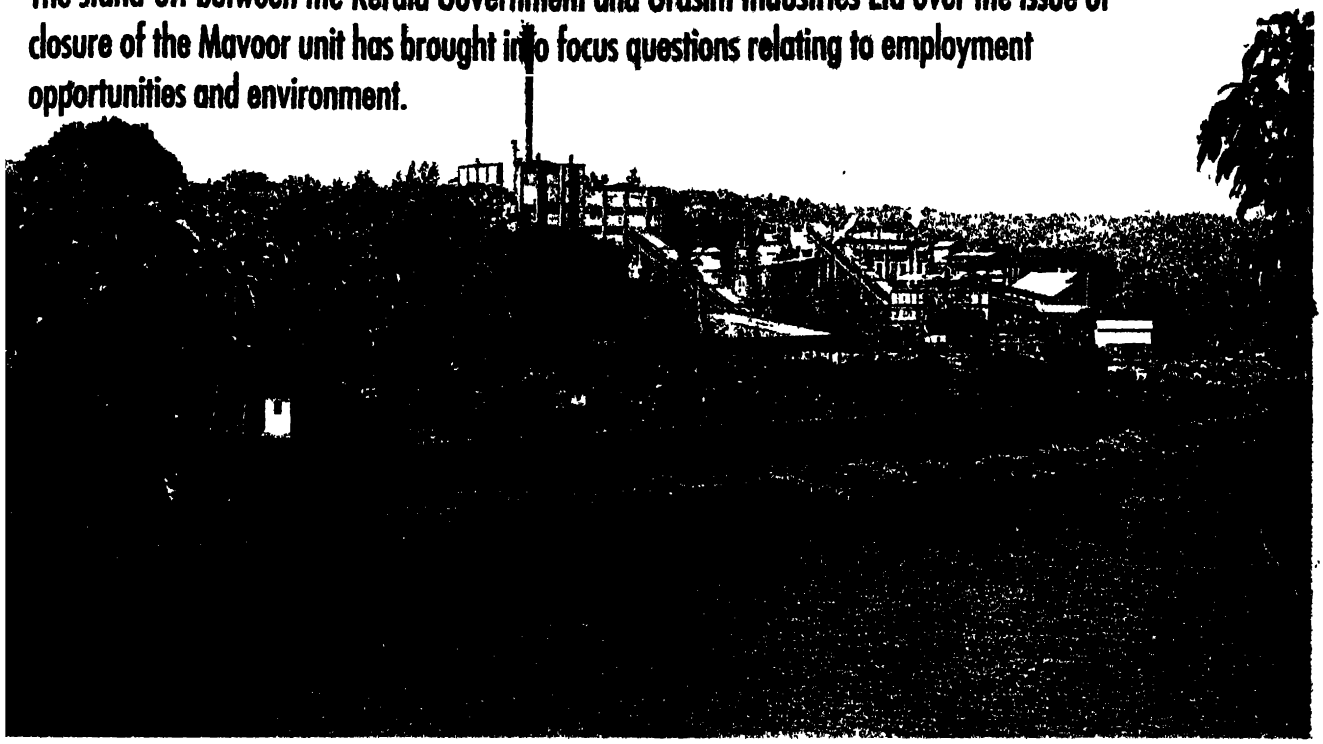
who described the "Vajpayee factor as a figment of Digvijay Singh s imagination asked "How is it that the Atal factor did not work in Uttar Pradesh, Karnataka and in the 11 constituencies in Madhya Pradesh where the Congress(I) won?

At a farmers' rally he led in Ujjain recently, Subhash Yadav claimed that he had the backing of senior Congress(I) leaders such as Scindia, Kamal Nath and Arjun Singh However, at a press conference in New Delhi, Scindia spoke against Subhash Yadav s public outbursts against Digvijay Singh and said that he should have first raised the issues at party forums

Other leaders are, however, believed to have asked Subhash Yadav to go ahead on the plea that a party member cannot be barred from giving public expression to farmers' grievances This emboldened him to disregard Pradesh Congress Committee president Radhakrishna Malaviya's plea to defer the Kalghat agitation and instead discuss the issue in the Legislature Party

Among the issues raised by Subhash Yadav is the neglect of farmers' interests by the State and Central governments He alleged that a drastic reduction in the support price of soyabean had badly affected procurement He also raised the issues of limited power supply to farmers, the increase in the sales tax on fertilizers, pesticides and farm equipment just before the Lok Sabha elections, and an over Rs 57-crore revenue loss incurred by the State because of a reduction in the mandi (market) tax from 1 per cent to half a per cent allegedly meant to benefit traders He is also critical of the Centre s decision to import wheat in huge quantities, which he says will harm the interests of farmers

Digvijay Singh may have earned a reprieve by blaming the party's reverses in the Lok Sabha elections on Vajpayee's popularity. The real test of his own popularity will be the approaching elections to civic bodies in 60 districts.



Interestingly, party president Sonia Gandhi has made no effort to dissuade Subhash Yadav from going public on these issues Subhash Yadav was willing to drop his "chakka jam" agitation if Sonia Gandhi requested him to do so However, it appears that by keeping silent she is backing his anti-Digvijay Singh utterances and actions This has caused dismay within the party She asked the PCC(I) to arrange a meeting between the Chief Minister and Subhash Yadav to sort out the issues raised by the latter However, the message that she is willing to tolerate indiscipline within the party had already gone home Will she allow this kind of dissent against her own leadership of the party? asked a Digvijay Singh loyalist

Observers, however, rule out any immediate threat to Digvijay Singh s leadership Subhash Yadav, who owes his stature to Digvijay Singh, has only negligible support among the MLAs There were only five ruling party MLAs at Kalghat on November 22, apart from the Member of Parliament from Khargone, Tarachand Patel The PCC(I) is in favour of taking disciplinary action against Subhash Yadav, but such action is unlikely to come through since senior leaders, including Digvijay Singh, have said that raising farmers' issues in public does not constitute indiscipline Subhash Yadav maintains that he cannot be accused of indiscipline "I am only trying to strengthen the party, not weaken it," he claims

Digvijay Singh may have earned a reprieve by blaming the party's reverses in the Lok Sabha elections on Vajpayee's popularity The real test of his own popularity will be the approaching elections to civic bodies in 60 districts. The Digvijay Singh camp is, however, confident that the ruling party will do well in these elections. ■

A stand-off in Mavoor

The stand-off between the Kerala Government and Grasim Industries Ltd over the issue of closure of the Mavoor unit has brought into focus questions relating to employment opportunities and environment.

The Grasim factory on the banks of the Chaliyar.

R. KRISHNAKUMAR
in Mavoor

THE biggest private sector industrial unit in Kerala, Grasim Industries Ltd, has had many claims to fame during the four decades of its existence. The factory, owned by the Aditya Birla group, manufactures rayon-grade wood pulp and viscose staple fibre (VSF).

At the time of its establishment in 1957 at Mavoor village on the banks of the Chaliyar river in Kozhikode district, the company, then named Gwalior Rayons Silk Marketing Company Ltd., was considered a boon to the industrially backward State with a high level of unemployment. Successive governments in the State actively encouraged the company by providing it water and power at heavily subsidised rates and access to forests to get the raw materials it needed – bamboo and eucalyptus – at abysmally low prices.

The Mavoor unit was the first in the world to manufacture rayon-grade pulp from bamboo. It was also the first to use heterogeneous species of pulpable wood, including eucalyptus and certain wild plants in the manufacture of rayon-grade pulp. In 1968, the second unit of Grasim Industries was established to manufacture VSF. Grasim Industries had poineered the manufacture of this cellulose fibre in the country using entirely indigenous resources, knowhow and equipment. (VSF, like cotton and polyester fibre, is one of the raw materials used to make yarn. VSF is blended with polyester and cotton in the manufacture of fabrics.) Today, Grasim, Mavoor, along with its sister units elsewhere in the country and abroad, has made Grasim Industries Ltd the world leader in VSF production.

WITH a steady rise in profits, the Mavoor units soon became the source of hope for the families of their nearly 3,000 employees.

Small businesses sprang up in and around Mavoor, depending mostly on the patronage of Grasim and its employees. The village, 21 km from Kozhikode, grew into a small town.

But the price the people in the neighbourhood, and Kerala society in general, has had to pay for this development was heavy. The residents of nine densely populated (average population density is 1,200 a sq km) panchayats along the Chaliyar river, mainly Mavoor, Vazhakkad, Peruvayal, Vazhayoor and Olavanna, were affected by severe air, water and solid waste pollution. Studies by various agencies have found in them a high incidence of serious health problems, including cancer, respiratory diseases, skin infection and vision impairment. The pollution caused by the Grasim units may be a major contributary factor for this, according to these studies.

According to the Kerala Sastra Sahitya Parishad (KSSP), the factory consumes 51,650 cubic metres of water every day (more than the daily consumption of Kozhikode, one of the three largest cities

Effluents being discharged into the river at Chunkappally.

in Kerala) and lets out 40,000 cubic metres of effluents into the Chaliyar. The effluents include acids, suspended solids, phenolic compounds, sulphides, oil and grease, heavy metals including mercury and zinc, ammoniacal nitrogen and organo-chlorine compounds. As a result the once-pristine Chaliyar became virtually a river of death.

The pollution caused by the emission of toxic gases (including sulphur dioxide, hydrogen sulphide, carbon disulphide, carbon monoxide, chlorine and traces of several others) has been made worse by the short stacks of the factory located as it is in a valley. All through its existence, Grasim Industries has ignored many of the norms set by the Central and State Pollution Control Boards (PCBs) on the disposal of liquid, gaseous and solid waste.

The latest of the studies conducted by the New Delhi-based Centre for Science and Environment – the first ever Green Rating Project to assess the Indian pulp and paper industry's environmental performance – has put Grasim Industries at the bottom of the heap; it is ranked 25th among 28 such units and faulted for its poor utilisation of raw materials, high consumption of water and chemicals, continued reliance on natural forests (with no effort to move towards farm/social forestry), violation of State PCB norms regarding effluent treatment, poor pollution control equipment, failure to recycle and reuse raw materials, poor technology, lack of an environmental policy and poor relations with the local community.

A comparison of the environmental performance of Grasim Industries with that of the three factories that received the best rating in the study, is revealing. While Andhra Pradesh Paper Mills Ltd, Rajamundhry, rated second by the centre, uses 1.95 tonnes of fibre to produce one tonne of paper, Grasim utilises 3.44 tonnes. While Ballarpur Industries Ltd, Ballarpur (Maharashtra), rated third, needs only 190 tonnes of water to produce one tonne of paper, Grasim requires 300 tonnes of water. While J.K. Paper Mills, ranked first, uses only 0.25 tonne of chemicals, Grasim uses 0.48 tonne to produce a tonne of paper. Similarly, while Grasim discharges 302.92 tonnes of waste water and chemicals for every tonne of paper produced, J.K. Paper Mills discharges less than half of this quantity – 139.2 tonnes.

The Grasim units' environmental performance appears even more alarming when seen in the light of the fact that even the top-ranking company has been given a total score of only 42.75 per cent by the Green Rating Project (Grasim's score is 20.65 per cent). This indicates the general state of the paper and pulp industry in terms of pollution.

In the absence of definitive studies, data on the use of bamboo and eucalyptus by the Grasim units and the subsidy they obtain for these forest produce broadly indicate the extent of the plunder of the State's forest wealth by Grasim industries. Environmentalists aver that this problem is as alarming as the pollution caused. The KSSP and the Chaliyar Samara Samiti, which has been demanding the closure of the units and the prosecution of Grasim Industries, allege that the factory is one of the principal culprits in the extensive deforestation in the Western Ghats. The State Government supplies two lakh tonnes of bamboo reeds, eucalyptus and other timber to the company at rates that are far lower than the market price or the price that the traditional users of the produce pay. Chaliyar Samara Samiti activists told *Frontline* that while the company paid Rs. 426 a tonne for bamboo, a tribal artisan in Wayanad, who made a living out of bamboo, had to pay between Rs. 3,000 and Rs. 5,000 per tonne. Hundreds of families of tribal and other artisans have thus been deprived of these raw materials, and thus their livelihood.

According to the KSSP, even by conservative estimates, the company is supplied free of cost water worth Rs.12.5 crores a year (calculated at the rate at which the Kerala Water Authority supplies water to ordinary consumers). As for electricity, the company pays the Government Rs.1.40 a unit, while the cost of generation is Rs.2 a unit.

The subsidies and concessions notwithstanding, Grasim Industries is accused of having all along attempted to evade its responsibility in the matter of the pollution it causes. The goodwill that the company earned initially owing to promise of employment it held out, turned into resentment.

The company meanwhile protected its own water sources from pollution by constructing a bund at Elamaram and locating the effluent discharge outlet downstream. In 1978, in one of the most significant phases of the local people's struggle against Grasim Industries, hundreds of people joined hands to demolish the bund. When the struggle became intense in Vazhakkad, one of the worst-affected villages, the company entered into an agreement with the Government to facilitate the discharge of effluents at Chunkappally, 7 km further downstream. Although it helped contain the Vazhakkad agitation, the company's failure to keep its promise of treating effluents properly paved the way for the agitation to spread to new areas – the vil-

'Mavoor unit has become unviable'

Interview with Grasim Industries president.

R.N. Saboo, president, Grasim Industries, who heads the Mavoor unit of the company, says that the failure of the Kerala Government to honour its commitment on supply of raw materials has made production at Mavoor unviable. Excerpts from an interview he gave to R. Krishnakumar in early November.

▶ *Why did Grasim seek permission for closure? There is a view that it is a ploy to wrest more concessions.*

The Government of Kerala has failed to meet its commitment of supplying the right quantity and quality of raw materials. The factory was reopened in 1988 on the basis of the commitment to provide two lakh tonnes of raw materials. It (the Government) failed to honour this commitment and the company was forced to procure raw materials from private sources and from Tamil Nadu, Karnataka, Andhra Pradesh and Uttar Pradesh. All this, especially the use of heterogeneous wood, affected the quality of pulp and increased the manufacturing cost substantially.

With liberalisation, quality has become a very important factor in the market. Imported pulp of a higher quality is available at a cheaper price and there are few takers for the pulp of inferior and inconsistent quality from Mavoor. Pulp of poor quality also affects quality down the line – the quality of the fibre produced from it, especially by Grasim's plant at Nagda which had been using substantial quantities of pulp produced at Mavoor. Also (it affects) the quality of yarn and fabrics. Fibre is one of the major businesses of Grasim Industries, and we cannot continue to produce low-quality stuff from low-quality pulp and keep accumulating stocks.

Moreover, a major change has taken place in the world textile sector. The demand for VSF (viscose staple fibre) has come down because of the availability of polyester staple fibre (PSF), which is cheaper than VSF. PSF, priced at Rs. 107 a kg in 1995, now costs only Rs. 40. This has resulted in a shift in favour of PSF in the making of polyester viscose blended yarn. (If earlier the ratio was 35/65, it is now 80/20 in favour of PSF.) In some other applications, the use of 100 per cent VSF has been stopped. All this has made VSF production at Mavoor unviable.

We require two lakh tonnes of raw materials in the form of eucalyptus wood alone – since bamboo has an inherent silica content, which affects the quality of pulp – from the Government at rates at which rayon-grade pulp can be produced economically. It is clear that the Government cannot provide raw materials of agreed quantity and quality. It is futile to enter into unrealistic agreements.

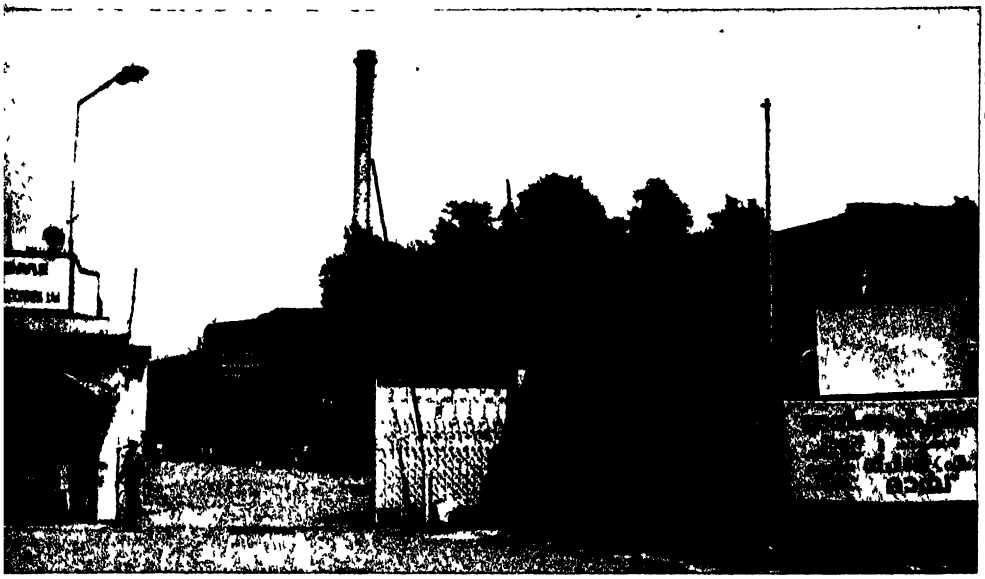
▶ *What prevents Grasim from finding raw materials of the required quality from other sources?*

The high cost of transport. The use of heterogeneous wood increases input consumption. It further affects quality and raises the cost of manufacture to uneconomical levels. Moreover, there are restrictions on the movement of wood in neighbouring States. Our efforts to become self-sufficient by buying 12,000 hectares of private forest land in Nilambur were discouraged when the Government went back on its commitment to us and nationalised private forests in Kerala (in 1971). Requests for land to raise captive (eucalyptus) plantations have been ignored.

▶ *There is this larger issue of pollution, based on which there is a definite demand for the closure of the Mavoor unit. Is Grasim not trying to run away from its responsibility? What about its responsibility towards its own employees?*

We have spent crores of rupees on pollution control and have been meeting the parameters prescribed by the State PCB (pollution control board) except in the case of the colour of the effluents. We have brought down pollution substantially. We cannot go on answering allegations raised by every other organisation. We have done everything possible to bring pollution down to acceptable levels, which has been acknowledged by the State PCB. Moreover, the kind of pollution also changes with the change in raw materials supplied.

We are running a business, not a charity. It is our policy that each unit should be a profit centre. Mavoor cannot drain the resources of another unit of the company.



▶ *The Government denied your request for closure.*

The company will explore all possible options. We can appeal for a review of the decision. There is also a provision to ask for a tribunal to decide on our appeal. If we don't get a favourable decision, we can also approach the court. ■

lages further downstream. The problem was aggravated by leaks in the pipes that carried effluents to the river. The company continued to ignore the directives from the State PCB and also courts, including the Kerala High Court, to ensure adherence to pollution control norms. A series of petitions seeking the closure of the Grasim units and the prosecution of the Company's management are pending before various courts.

On August 23, Grasim Industries (which had already declared an extended lay-off for "annual maintenance") approached the Government seeking permission to close both its pulp and fibre divisions. This move, which means loss of livelihood for the families of its over 3,000 employees, put the workforce, the Government and, to a certain extent, the local population on the defensive.

In a State where the rate of unemployment is high and industrial investment low and slow in coming, Grasim had placed itself in a comfortable bargaining position *vis-a-vis* the Government. It had ruthlessly demonstrated its power as a major employer on several occasions. In 1985, when public pressure against pollution by Grasim was at its peak, the management closed the factory for nearly three years citing "labour trouble" as the reason. It was a time when the price of paper pulp had come down in the international market and import of pulp had become a cheaper option for the Grasim conglomerate, which had a strong presence in the textile market in India and abroad. The

RAMESH KURUP

At the factory entrance, a plea against closure.

group manufactured a chain of products from wood pulp to apparel. The hardships of the employees and their families (many workers were driven to penury and even suicide) forced the Government to its knees. It was prepared for any compromise with the management to get the factory reopened. An agreement between the State Government and Grasim, signed in 1988, was nothing but a surrender by the former. The management succeeded in wresting more concessions on the supply of raw materials, while the Government could not impose any restriction or obtain any assurance on pollution control.

OVER the years, Grasim did make some efforts to control pollution, but the problems persisted. The depletion of Kerala's forest wealth continued and protests by the affected people intensified. The Grasim problem came to be seen increasingly as a problem of rehabilitation of 3,000 employees. Pressure was certain to mount on the company to behave, control pollution and modernise production technology – in short, to invest more in Mavoor with this end in view.

Grasim had, however, been comfortably placed to resist any such pressure. The most important factor was that the Mavoor unit was only one of the six VSF units of Grasim Industries, the flagship company of the Rs. 20,000-crore Aditya Birla group. The group is the world's largest producer of VSF with an aggregate capacity of more than 300,000 tonnes spread over three countries. With the establishment of a modern rayon grading technology plant (using hybrid eucalyptus) in Karnataka in 1972, it became the largest producer of rayon-grade wood pulp in India (aggregate capacity 130,000 tonnes). In 1998, the group acquired a joint venture pulp mill (with Tembec Inc. Canada) in Canada, whose entire production of 110,000 tonnes is used for the captive consumption of its various VSF units in India, Thailand and Indonesia. Clearly, in Grasim's scheme of things, the Mavoor plant, which has all along survived on the Government's benevolence and inability to enforce pollution control norms, has fallen in importance and, in the context of the demands for more investment, become more a liability.

It is in this context that the notice issued by the company for the closure of its pulp and fibre units and the reasons stated for it (see interview) become significant. The company's main arguments in favour of closure are: the required quantity and quality of raw materials can no longer be obtained in Kerala; the Government has reneged on its commitments on the supply of raw materials; the use of heterogeneous wood affects the quality of pulp produced; the poor quality of pulp has brought down its price and also the quality of downstream products such as fibre. All this has to be seen in the light of globalisation that has opened the door for quality pulp and fibre at lower prices in the market, making the Mavoor unit unviable.

As November 30, the date on which the company sought to close down, drew closer, the stage appeared set for a long battle between Grasim Industries and the State Government, which has refused permission to the company to close down. Labour and Rehabilitation Secretary C. N. Ananda Bose told *Frontline* that the Government refused to permit the company to close down after considering its request strictly on merit. "The company's argument that its units have become unviable is merely stating the inevitable," said Ananda Bose. "It is not in the VSF/pulp sector alone that the impact of liberalisation, especially of cheaper imports, is being felt," he said and added that the company had to reorient its policies to meet the challenges of liberalisation.

Ananda Bose said that the alleged failure of the Government to honour its commitment on the supply of raw materials could not be a convincing reason for closure. Significantly, he said, under the agreement between the Government and Grasim the company was free to procure raw materials from the open market and that the Government would make good any loss that may accrue to the factory in the process. The company had failed to lift even the raw materials already allotted. In fact, raw materials needed for one year had been made available, although Grasim said that the stock on hand was enough for only three months, he said.

Organisations including the KSSP have pointed out that Grasim Industries has cumulatively obtained subsidies and other benefits to the tune of Rs. 500 crores in the past one decade alone (and that these added up to a much larger figure in the two earlier decades). According to them, a company, which started production with a capital investment of Rs.10 crores, now has assets worth Rs.1,000 crores, built out of the profits made from Mavoor alone. They point out that Grasim has a moral and legal duty to alleviate the sufferings of the people of Mavoor and surrounding areas. By issuing a notice for closure, Grasim is but trying to shirk its responsibility of modernising its production and pollution control techniques.

With Industries Minister Suseela Gopalan stating that the Government's priority will be to protect the jobs of the employees and with Grasim making its intentions clear by stating that "we are running a business, not a charity", what the company perhaps plans is a repeat of its 1998 blackmail. ■

Militancy unchecked

In the absence of adequate central security forces, extremists step up violence in Tripura to unprecedented levels.

KALYAN CHAUDHURI

THE November 14 massacre of 18 members of a non-tribal community at Panchabati in South Tripura by the All Tripura Tiger Force (ATTF) was another bloody episode in the State's long history of ethnic violence. What made it particularly disturbing was the report that the assailants came from Sylhet in Bangladesh and returned there after the operation.

Nearly 40 ATTF extremists in Army fatigues reached the market in the village unobtrusively in small groups around 6 p.m. Shopkeepers mistook them for Assam Rifles jawans. Soon they cordoned off the market and opened fire with AK-47 rifles. Eighteen persons died on the spot. After one round of firing, the militants staged a mock retreat to the sound of a whistle. But as soon as people ventured out of their shelters, they returned to loot and set fire to shops before leaving the scene. The entire operation lasted 20 minutes.

With insurgent groups such as the ATTF and the National Liberation Front of Tripura (NLFT) stepping up armed action to drive out non-tribal communities from the tribal-dominated Autonomous District Council area in the hills, the situation has become explosive. In November alone violence claimed the lives of 30 civilians from non-tribal communities. A week after the Panchabati incident, NLFT militants gunned down eight police constables in an ambush in the remote Banduar area in the Udaipur subdivision of South Tripura. This was the first major attack on security forces since the Lok Sabha elections on October 3.

Police sources said that on the morning of November 22, a mini-truck and a jeep carrying armed police personnel headed for the Maharani area with a record of extremist activity from Udaipur, the headquarters of South district, on a long-range patrol. A massive landmine blast damaged the vehicles in the Banduar area. Heavily armed NLFT militants, who waited atop hillocks on both sides of the road, then attacked them with grenades and AK-series rifles.

POLITICAL parties in the State reacted strongly to the Panchabati incident and the attack on the security forces. They tried to outdo one another in organising bandhs. The ruling Left Front, led by the Communist Party of India (Marxist), called a statewide bandh on November 15. The Trinamul Congress followed with a 12-hour bandh the next day. Following the ambush on the police personnel, the CPI(M) called a 12-hour bandh in Udaipur subdivision on November 23. In an effort to steal the CPI(M)'s thunder, Trinamul Congress called a 30-hour bandh in the subdivision from the afternoon of November 22 itself. The Congress(I) organised a 12-hour bandh on November 12 in protest against what it described as the Left Front Government's failure to rescue three schoolchildren who were abducted by militants from Kalyanpur on November 1.

SUSHANTA PATRONOBISH

On November 30, Chief Minister Manik Sarkar at an all-party meeting in Agartala convened to discuss the insurgency problem in Tripura.

A four-member parliamentary delegation of Left parties, led by CPI(M) leader Somnath Chatterjee, arrived in Tripura on November 17 to assess the situation in Panchabati following the massacre. The delegation was prevented from reaching the area by local people who protested against the Government's failure to protect their lives. The delegates, who were attacked, left the area in damaged vehicles, under heavy police escort. A large police contingent had cordoned off the area, but nearly 500 people, including members of the victims' families, broke through the barricade and shouted slogans. They pelted the VIP entourage with stones. Earlier, delegations of Opposition parties were forced to go back after residents staged violent demonstrations.

The Left Front Government has repeatedly sought from the Centre additional security forces. It links the spurt in militant activities to the pullout from the State of three Army battalions during the Kargil War.

Undeterred by the people's opposition to their visit, the parliamentary delegation of the Left endorsed Chief Minister Manik Sarkar's demand for additional security forces. In messages faxed to Prime Minister Atal Behari Vajpayee and Union Home Minister L.K. Advani, it said at least four additional companies of paramilitary forces were needed to bring the law and order situation under control.

The delegation comprised, apart from Somnath Chatterjee, Amar Roy Pradhan of the Forward Bloc, Ajoy Chakravarty of the Communist Party of India and Sanat Mandal of the Revolutionary Socialist Party. They said that more Border Security Force (BSF) battalions were also required, to seal the "porous" border with Bangladesh. Somnath Chatterjee said: "Had additional forces been deployed in Tripura earlier, the massacre at Panchabati could

The real story. Every time

have been prevented."

Informed sources in the CPI(M) said that the four parliamentarians were upset over some heckling they encountered at Panchabati and reprimanded the State CPI(M) leadership for failing to prevent the incident. A CPI(M) press release said the people of Panchabati had been instigated by vested interests to oppose the team's visit. It said the heckling of the four Left Front leaders was tantamount to "strengthening the hands of terrorists."

The Left Front delegates said that the behaviour of the local people was a "natural reaction" to a tragic event. "We respect the sentiments of the people and share their grief," Somnath Chatterjee said. He criticised the BJP-led government at the Centre for its failure to "properly assess the situation in Tripura". He said that all together 76 people had been killed, 88 abducted and 47 injured by militant organisations in the State over the past three months.

The Congress(I), the Tripura Upjati Juba Samiti (TUJS), the BJP and the Trinamul Congress demanded that the CPI(M)-led Left Front Government be dismissed and President's Rule imposed in the State. The demand was first raised by BJP national president Kushabhau Thakre at a press conference in Calcutta shortly after the Panchabati incident. "We are against the removal of any elected government but the law and order situation in Tripura has gone from bad to worse and warrants the Centre's intervention," Thakre said, adding that the Left Front Government was unable to tackle the extremists.

In a memorandum submitted to the Prime Minister, the State wing of the Congress(I) said: "We are aware that imposing President's Rule in Tripura is quite difficult after the Supreme Court judgment in the S.R. Bommai case in 1994. But the Constitution empowers the Centre to intervene effectively in the State's affairs without invoking Article 356." The demands placed before the Prime Minister by the Congress(I) are: the removal of Governor Siddheswar Prasad, Central intervention in the State, a directive to the State government to form an independent command under the Army's leadership to counter insurgency, the extension of the Disturbed Area Regulation to cover the entire State, and amendment of the Constitution to bring Tripura under Article 371.

The CPI(M)'s central leadership came down heavily on Thakre for seeking the imposition of President's Rule. The Central Committee stated: "It was on the basis of the Centre's proposal that the State Government decided to bring Tripura's 27 police stations in the hill areas under the Disturbed Area Regulation in February 1997 to enable the Army to carry out counter-insurgency operations in the hills. But the Centre has withdrawn even the last battalion of the Army from the State during the Kargil conflict. Now the Central Reserve Police Force (CRPF) troops, with no special training in counter-insurgency operations, are drawn into action against well-equipped underground extremists carrying sophisticated weapons. Tripura is the only State in the northeastern region where there is no Army to combat insurgents."

The Chief Minister told *Frontline* that his government had on a number of occasions placed before the Union Home Ministry maps showing locations of camps of extremists from northeastern India within Bangladesh territory so that diplomatic pressure could be exerted on Dhaka to close them down. "Nothing tangible has so far been done by the Centre," he alleged.

The Chief Minister said that there were 29 camps of the outlawed ATTF, the NLFT and the Manipur People's Liberation Army (MPLA) in Bangladesh's Chittagong Hill and Sylhet regions. Tripura, he said, required at least 18 battalions of the BSF to guard its 856-km border with Bangladesh, but it had only one battalion. The Centre was being persuaded to deploy additional BSF battalions to strengthen the security posts at least along the border with the Sylhet and Chittagong hill regions, Manik Sarkar said. "The Centre is silent over the State's demand for additional forces."

On returning from Tripura, Somnath Chatterjee said his party would persuade other Opposition parties to initiate a "joint move on the Tripura issue" in the Lok Sabha to bring pressure on the Centre to help the State government counter insurgency. He said that Tripura's security problem would be raised in the House, but "before that we shall initiate a dialogue with other Opposition leaders for a consensus on Tripura's problem of insurgency, like the understanding we reached earlier on Kashmir." He said that underground extremists had stepped up killings and abductions "alarmingly" in the State, giving rise to a trend of "ethnic polarisation" which had ominous implications.

A paradox in Maharashtra

Affluence and extreme levels of poverty co-exist in Maharashtra, thanks to an obsession with industrialisation and the neglect of the agricultural sector. The State needs to evolve broad policy initiatives in order to address the problem.

BHALCHANDRA MUNGEKAR

FOR historical reasons, Maharashtra has emerged as India's most industrialised State. Its capital, Mumbai, is rightly considered the financial and commercial capital of the country. Naturally, other States strive to imitate the development model of Maharashtra. Thus it is that hundreds of thousands of people from the rest of the country arrive in Mumbai hoping to have access to some means of livelihood.

In this background, there ought to be a general perception that poverty is less pervasive in Maharashtra than in other States. In reality, however, that is not the case. The coexistence in the State of affluence and disproportionate poverty is particularly distressing.

In 1997, the per capita income (PCI) of Maharashtra at current prices was as high as Rs.17,666, second only to Punjab's Rs.18,223. It was four and a half times that of Bihar, more than two and a half times that of Orissa, twice that of Kerala, and nearly one and a half times that of Gujarat and Karnataka. But what about poverty? According to an expert (Lakdawala) committee, 38 per cent of the population of the State was below poverty line (BPL) in 1993-94. On the other hand, the extent of rural poverty in Gujarat and Karnataka was 22 and 30 per cent respectively, and rural poverty in Kerala was less than that in Maharashtra by 12 percentage points. Significantly, the extent of rural poverty even in a State like Orissa was nine percentage points less than that in Maharashtra. At the same time, the extent of rural poverty in Maharasthra was on a par with that in the country as a whole (in fact, it was one percentage point higher) despite the State's PCI being one and a half times higher than the national average.

Maharashtra cannot derive consolation even from Bihar, because though the extent of rural poverty is higher by 20 percentage points in the case of the latter, its PCI was barely 22 per cent of that of Maharashtra.

The reality with respect to urban poverty was not radically different either. Urban poverty in Maharashtra was higher than in Gujarat and Kerala (by seven and 10 percentage points, respectively), while the State has the dubious distinction of being ranked on a par with Bihar. Even the all-India level of urban poverty was three percentage points lower than Maharashtra's.

Again, in terms of Human Development Index (HDI), Kerala, Karnataka, Gujarat, Orissa and Bihar rank second, fourth, seventh, eighth and 12th respectively, while Maharashtra ranks 14th. The female literacy rate in Kerala is 74 per cent compared to Maharashtra's abysmally low 34 per cent.

THESE facts lead one to three broad conclusions. First, in terms of economic growth (PCI), Maharashtra is very advanced and ranks next only to Punjab. Second, both rural poverty and urban poverty are comparatively more pervasive in Maharashtra and are disproportionate to the State's profile of economic prosperity. Third, economic growth is only a necessary, but not a sufficient, condition for the alleviation of poverty.

It is now imperative to explain the paradox of the coexistence of *affluence* and *poverty* in Maharashtra. First, owing to its obsession with industrialisation, Maharashtra neglected its agricultural sector. Although the agricultural sector accounts for only one-fifth of the State Domestic Product (SDP), it provides sustenance to between 75 and 80 per cent of the population. In 1981-82, the extent of irrigated area was barely 12 per cent, and that increased to 15 per cent in 1993-94 – that is, by three percentage points in nearly one and a half decades. On the other hand, corresponding figures for Bihar and Orissa were thrice and twice respectively that of Maharashtra. Even Gujarat and Karnataka were way ahead of the State in this regard; so is the country as a whole.

Maharashtra is thus deficit in terms of foodgrain production. Sugarcane and cotton are the two main cash crops of the State. In the case of sugarcane production, the State ranks second, behind Uttar Pradesh. It has successfully built up a cooperative sugar economy, mainly in the western Maharashtra region. In the case of cotton, the State has been uniquely employing the Monopoly Cotton Procurement Scheme. What is disappointing, however, is that the increase in the production of both sugarcane and cotton has been achieved *not* through any increase in productivity (yield per hectare) but by progressively enhancing the area under cultivation.

Punjab's productivity in the case of cotton is about two and a half times more than that of Maharashtra. The situation in Maharashtra in respect of sugarcane is more alarming. For instance, during the decade 1981-91, sugarcane productivity in the State declined by 1.5 per cent per annum. What is further shocking is the fact that sugarcane on barely 2.5 to 3 per cent of the land under the crop grabs nearly 60 per cent of the total irrigation water. This is socially offending inasmuch as 80 to 85 per cent of the marginal, small and dry land medium farmers in the State are denied irrigation water even for a single crop. For them, farming has become a distress activity.

OF late, industrialisation has slowed down in the State. In 1980-81, the industrial (secondary) sector accounted for 35 per cent of the SDP, and this declined to 34 per cent in 1995-96. Industrial production grew at an annual rate of about 9 per cent during the decade 1981-91, while during the next six years it decelerated to 6 per cent per annum. As a result, during 1993-1997, Maharashtra's share in the country's industrial production remained stagnant, between 16 and 17 per cent. The same

was true of the State's share in the country's aggregate factory employment, which was around 14 per cent and which in all probability may have declined further. There has been a large-scale industrial sickness, which is growing. For instance, the number of sick large units increased from 146 in 1985 to 312 in 1990, while that of small sick units from 8,500 to 20,000.

Industrial sickness must have further increased in the past eight years, worsening the problem of unemployment.

Deteriorating industrial relations and the faulty handling of industrial relations by the State Government are among the main reasons for the industrial deceleration. The State Government handled the 1982 textile mill strike with ineptitude and callousness. Even today, the Government is dilly-dallying with the millowners' demand to sell the mills' surplus land. On the other hand, the employment scene in the State is worsening. For instance, at the end of December 1998 there were 41 lakh names on the employment exchange registers: 25 per cent of these persons had not passed the Secondary School Certificate (SSC) examination, 52 per cent had SSC as their qualifications and the remaining 23 per cent were with higher education. Although immediately after coming to power the Shiv Sena-BJP Government promised to create of 27 lakh jobs, it virtually did nothing in this regard.

In 1973, Maharashtra introduced the Employment Guarantee Scheme (EGS) with a view to giving the guarantee of employment to all unskilled persons in the rural areas within a radius of 5 kilometres. In 1977, the State enacted the relevant legislation and made the EGS statutory. The EGS won appreciation not only in India but in the entire developing world as a unique and novel scheme. During the last 25 years or so, there have been a number of studies evaluating the EGS from all possible angles. What, however, has emerged from these studies is that notwithstanding its limitations the EGS proved to be a major source of livelihood for lakhs of unskilled rural people, both men and women, particularly from the poverty-sticken Marathwada region and part of the Vidarbha region.

During the last few years, however, the EGS has been marginalised. For instance, in 1989-90 the Government spent about Rs. 288 crores on the EGS, but in 1991-92 the expenditure fell by about Rs. 100 crores to Rs. 194 crores. During the same period, expenditure on wages fell from Rs. 153 crores to Rs. 108 crores. In 1986-87, employment of about 19 crore person-days was created. In 1991-92, the figure declined to barely 6.5 crores. Although employment increased to about 9.7 crores in 1995-96, it was still half of its volume in 1986-87. Thus wide-scale rural poverty in Maharashtra may partly be attributed to the decline of the EGS.

NOR is the State serious about improving the Public Distribution System (PDS). It is obvious that being a deficit State its rural people depend very much on the PDS. It is, therefore, imperative that the State implements the PDS with commitment and sincerity. But this is far from the reality. The gap between the Central Government's allotment of grains (rice and wheat) and the State's purchases is a clear testimony to this. For example, in 1990 the Centre allotted 17.35 lakh tonnes of grains, while the State (fair price shops) lifted 16.58 lakh tonnes. In 1994, however, out of the Central allotment of 18.18 lakh tonnes, barely 8.13 lakh tonnes was lifted (The position improved somewhat between 1994 and 1998). Secondly, nearly 30 per cent of the PDS grain is offered to the city of Mumbai alone, while the rest of the State has to be content with the remaining 70 per cent. Lastly, unlike other States, Maharashtra does not add its own subsidy on PDS grain to that given by the Central Government, as a result of which PDS prices in Maharashtra have been higher than those in Orissa, Bihar, Rajasthan and Uttar Pradesh. This is despite the State Government's attempt to hold PDS prices for five years.

THE social sectors in the State too have been deteriorating. For instance, the number of public/government-aided hospitals and dispensaries declined from 830 and 1,702 in 1992 to 714 and 1,423 in 1997 and the number of primary health centres increased by a mere 23 in a period of five years – from 1,672 to 1,695 . It is therefore not surprising that the number of beds per lakh of population declined from 144 in 1992 to 141 in 1997. Again, 89 per cent of the rural households do not have sanitary facilities.

On the whole, the expenditure on social sectors such as health, education and drinking water and that on the weaker sections such as the Scheduled Castes and the Scheduled Tribes, as also women are grossly inadequate, particularly when compared to the State's level of economic development.

Again, the level of real agricultural wages (RAWs) in the State is far from satisfactory. This has made makes the conditions of agricultural workers deplorable. During 1991-92 and 1995-96 the RAWs in the State actually declined. Persistent demands from agricultural labourers and their organisations for higher wages have been of no avail.

Lastly, the imbalance in regional development has been a formidable problem that the political economy of the State faces. Owing to a series of political agitations in the backward regions of Marathwada and Vidarbha, the State Government formed, a decade ago, the Statutory Development Councils (SDCs) and assigned to them the responsibility of overall economic development of these regions. But owing to several constraints, particularly the gross inadequacy of financial resources, the SDCs have done pretty little, compared to what was expected from them.

AS a way to address the issue of poverty amidst affluence in Maharashtra, one may suggest that the following broad policy initiatives:

(i) Irrigation potential should be developed to the maximum extent, with fair distribution of water among different regions and sections;

(ii) Rural industrialisation and diversification should be given top priority;

(iii) Social sectors such as health, education, provision of drinking water and sanitary facilities, need to be given due attention with emphasis on the development of women and other weaker sections, particularly in the rural areas;

(iv) The EGS should be restructured to make it more viable, with an upward revision of EGS as well as minimum agricultural wages;

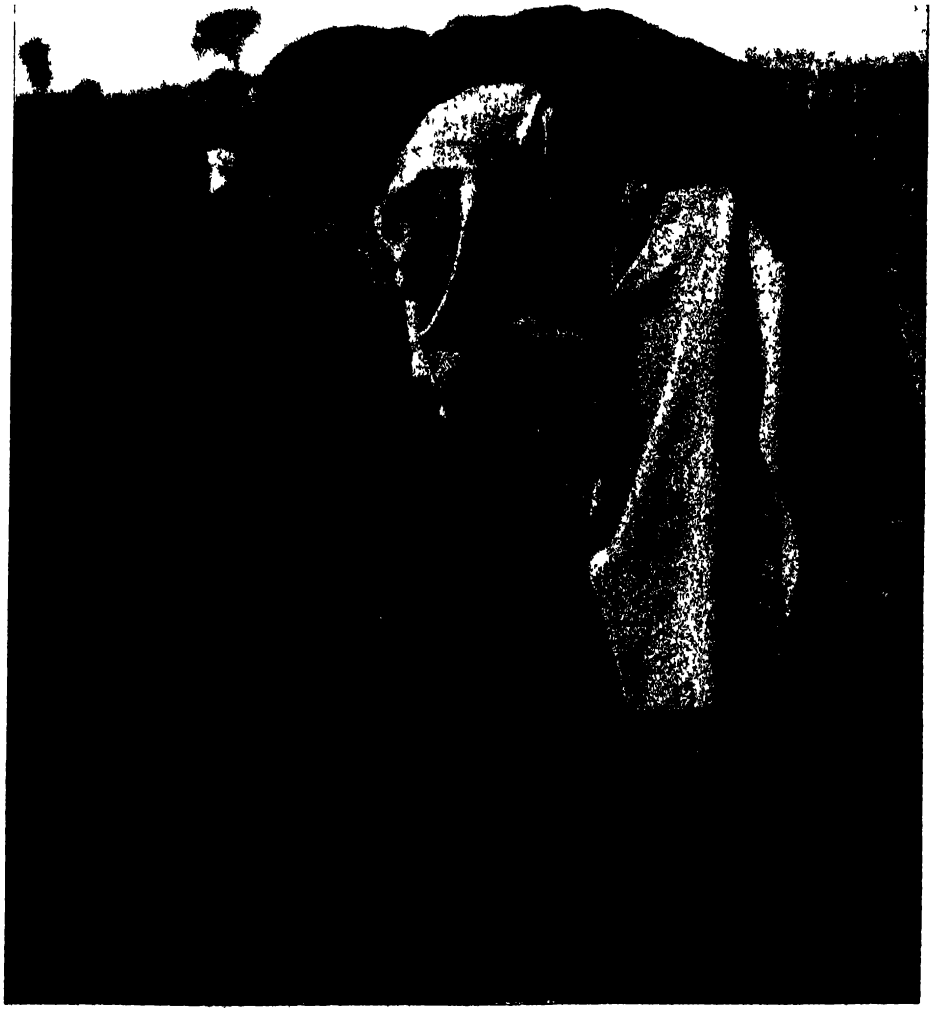
(v) The PDS should be properly revamped and sincerely implemented with more attention to the rural poor; and

(vi) The imbalance in regional development should be effectively removed within a reasonable period of time.

If the political leadership of Maharashtra genuinely believes in making economic growth socially relevant, it would be rather obligatory for it to start working immediately on these policies and programmes. But that will require political will of a high order. Do the rulers in Maharashtra have such political will? ■

Dr. Bhalchandra Mungekar, Professor of Industrial Economics at the University of Mumbai, is a member of the Commission on Agricultural Costs and Prices.

Down and out in Punjab



Punjab's Dalits get a raw deal; and this is deepening caste fissures in the State.

PRAVEEN SWAMI
in Ludhiana

SAMEY SINGH desperately needed time off from his job at a brick kiln near Faridkot, southern Punjab. Back home, in Megha Kheri, the family's home village near Muzaffarnagar in Uttar Pradesh, his son Rahul had fallen seriously ill. But Samey Singh had taken a Rs.5,000 advance from the kiln owners at the start of the season, and they were only willing to let him go if he left behind his wife and daughter. Pali Singh and her daughter Pooja were forced to work without pay and on some days, without food. Both were often beaten, and six-year-old Pooja was threatened with sexual abuse. At sunset, mother and daughter were locked into a six foot by ten foot hovel.

There are supposed to be no slaves in Punjab, one of India's richest States. In a State known for its affluence and egalitarian traditions, its Dalits have for long been believed to be better off than oppressed castes elsewhere. In some senses, they still are. But Samey Singh's story is just one in a chain of brutalities directed at Punjab's Dalits in recent months. At a time of shrinking economic opportunities, caste fissures are deepening in the State.

POOJA would have spent her life as a slave if it had not been for chance. In September, Tarsem Jodhan, general secretary of the Centre of Indian Trade Unions (CITU)-affiliated Lal Jhanda Punjab Bhatta Mazdoor Union (Red Flag Punjab Brick-kiln Workers' Union) visited western Uttar Pradesh on an election tour. During a meeting in Megha Kheri, held to canvass Chamar

A woman labourer at a brick kiln. The economic problems of Dalits in a State known for its prosperity are sharpening, thanks to the failure of successive State governments to shape rural development policies.

... TN/MS/(C)/PP-130/...

Samey Singh and his wife Pali in their new home in Ghawwadi village. (Right) Pooja, Samey Singh's six-year-old daughter, who was enslaved and maltreated for six months by her employer, after her release.

caste migrant workers there, Samey Singh came up to Jodhan. His wife had been thrown out of the kiln that month because injuries caused by beatings had left her unable to work. The couple had tried unsuccessfully to get their daughter back. "The kiln owner did not give me my job back," Samey Singh said, "so I didn't have any money. He just wouldn't give Pooja back to us."

Jodhan moved the Punjab and Haryana High Court, which sent an officer to rescue Pooja Singh. On October 4, six months after she was made a slave, Jodhan found Pooja locked in a cell, terrified, near-starving, and bruised from repeated beatings. "They used to tell me they would get me married," Pooja Singh told *Frontline*, "so that they could put my children to work as slaves too." Amazingly, police officials at Dharamkot, the Faridkot area where Pooja and Pali Singh were held captive, have taken no action. "When I was thrown out of the kiln, I went to the Dharamkot police station, but they threw me out. No one would even let me into the building, let alone register a complaint," Pali Singh said.

Ghawwadi village, an hour's drive from Ludhiana, is the Samey Singh family's new home. Although most workers here say the kiln owner has a good reputation in the area, conditions are subhuman. Workers are paid about Rs.140 for every 1,000 bricks they turn out. If women and children work 16 hours a day along with the men, a family can make some 800 bricks. Each family puts in 12 days at a stretch, and then takes three days off to recover. During the monsoons, most of the estimated 2.5 lakh migrant brick-kiln workers return to their homes in Uttar Pradesh. What they save through the nine months in Punjab has to see them through the monsoon, for there is little work to be had in Muzaffarnagar or elsewhere.

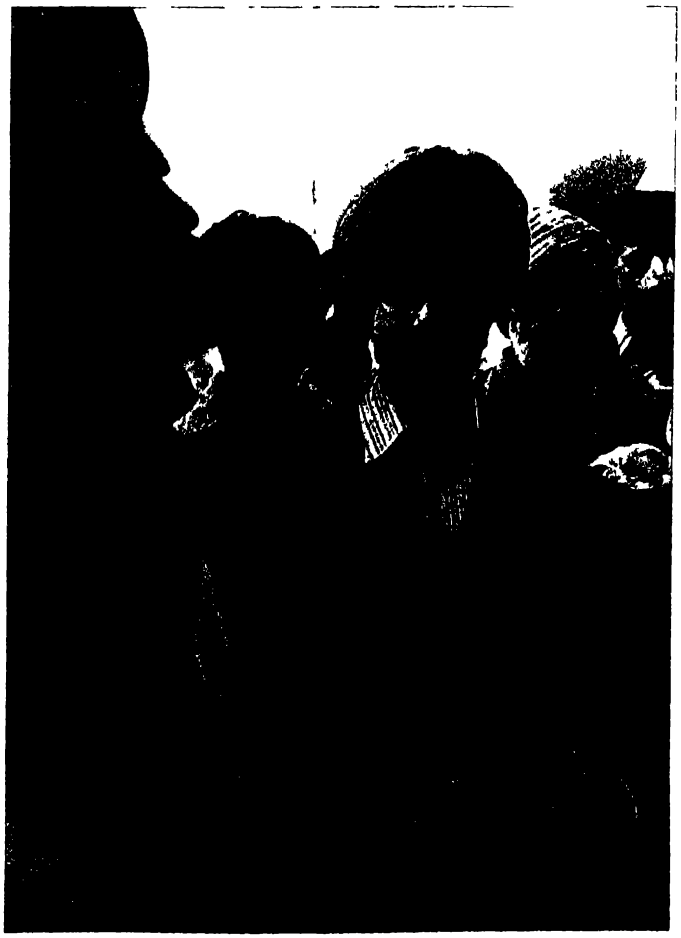
If the wages seem relatively attractive, they do not guarantee basic human rights. Hours spent in the slush, exposed to the evening cold and searing kiln heat, mean that sickness is common. Workers in Ghawaddi told *Frontline* that each family spent upwards of Rs.1,200 a month to treat fevers and diarrhoea. Workers have to use the services of the plethora of quacks operating in rural Punjab, for there are no government-run health facilities nearby. Access to clean drinking water is minimal, and there are no sanitation facilities at all. Most children appear severely malnourished. No families carry ration cards, and they must buy food in the market. Sugar sells at Rs.17 a kg, and flour at Rs.8. No family can afford vegetables or milk.

Perhaps worst of all, the migrant workers are denied even the few opportunities for progress that Dalits have elsewhere. Not a single child in Ghawaddi goes to school. Although a few families have tried to keep at least one son at school in Uttar Pradesh, girls do not get that chance. Work starts at an improbably young age, with three-year-olds scooping out slush for their parents to shape into bricks. Although service terms and working conditions at Punjab's brick kilns violate the Factories Act, Lal Jhanda Bhatta Mazdoor Union officials say that not one single unit has been prosecuted so far. Kiln accidents are common, but families never get the compensation they are legally entitled to.

MIGRANT workers do not have a vote, so the Punjab Government succeeds in pretending that they do not exist. But conditions are not enormously better for Punjab-based Dalits either. Most Dalits at Dhaliyan village belong to the Ramdasiya caste, and have for generations worked on the fields of local landlords. During the Green Revolution, when demand for workers went up and wages rose, most Dalit families managed to procure some basic assets. Every family now has a few buffaloes and decent shelter. But with combine harvesters displacing agricultural labourers, and machines taking over jobs such as plant-

ing potatoes, making a living is becoming more difficult than it has been in decades.

Raj Singh has seen the change. "Ten years ago," he said, "it was easy to find work 25 days a month, and I would be busy right through the harvest and sowing seasons. Now, there is barely work in the fields for three days a month." Wages, too, have dipped. "The landlords offer us Rs.60 a day. If we ask for more, they tell us there are thousands of migrants willing to work for half that amount." As a result, more and more Dalits have been pushed to do casual jobs, such as selling vegetables or scavenging plastic bags to be recycled. Others have ended up in the brick kilns. A decade ago, Ram Dayal, a resident of Burji Hakima, worked as a farmer. "I could buy 10 kg of gur (raw sugar) with a day's wage then," he said. "Now, it takes me two days of work at the kiln to buy the same quantity."



The problem does not lie in combine harvesters, but in the failure of successive governments in the State to shape rural development policies that benefit the poor. The village infrastructure that could have improved the lives of the Dalits has fallen apart. In Dhaliyan, as in many other neighbouring villages, only Dalits send their children to government schools. This strange apartheid has come about because most people who can afford it, send their children to private schools which have better facilities and also teachers who actually show up for work, unlike state-run schools. Dhaliyan does have a ration shop, but despite recent price hikes, only poor-quality sugar and rice are available here, and kerosene never is. By way of contrast, the Punjab Government has the budget to waive electricity charges for big landlords who own tubewells.

IF the economic problems of Dalits have been sharpening in Punjab, the Shiromani Akali Dal-Bharatiya Janata Party alliance has added to their woes by unleashing the state apparatus against them. On September 17, police and administration officials in Jeevan Nagar, Faridkot, demolished 40 houses built by Dalits on government land. About 175 people, including 50 children, were thrown out with due notice and lost an estimated Rs.15 lakh in the demolition. The Dalits had been allowed to move on to the land in the build-up to the recent Lok Sabha elections, and some had even secured electricity connections. Their failure to return the favour by voting for the SAD-BJP combine, residents say, led to the retaliation.

A similar demolition took place in Sangrur after the Lok Sabha elections. Hansa Singh's family, which lives in Buttar village near Moga, chose to vote for the Communist Party of India(Marxist) candidate, Principal Ajit Singh. Despite the fact that their home on *shamlat* (village) land had been up for six years, Hansa Singh's son Baldev Singh said, a local SAD worker and panchayat member ensured its demolition. Dalit houses were brought down also in another Sangrur village, Lasoolpur. The Faridkot Unit of the Association for Democratic Rights did intervene in the demolition there, but no official action has been taken. Minor village-level demolition generally passes unreported and unnoticed.

When the state does step in, it is generally to crush Dalit protests. Gurketan Singh and Beera Singh were infuriated when the upper caste sarpanch of Burji Kalan village in Bhatinda district decided to lease out a pond, which the entire village used, to a contractor. A fight broke out, and Sarpanch Sukhjit Singh was stabbed. The next day, June 7, mobs burned down the houses of Gurketan Singh and Beera Singh, and threw into a nearby canal whatever belongings they could find. The local unit of the Communist Party of India (CPI) intervened to secure peace, and arranged for both the young men to surrender. Nonetheless, both were alleged to have been tortured in custody. No action was taken against the mob which destroyed the Dalit families' houses.

In January, four members of the village panchayat of Bhungar Khera village in Abohar paraded a handicapped Dalit woman naked through the village. No action was taken by the police, despite local Dalit protests. It was only on July 20 that the four panchayat members were arrested, after the State Home Department was compelled to order an inquiry into the incident. But the State police is prompt in redressing complaints against Dalits. When 65-year old Nand Lal failed to pay back an advance of Rs.6,000 to the owner of the brick kiln where he works, personnel from the Jalaldiwal police post of Raikot police station stepped in. "The police made him put his thumb impression on papers written in English," said his son Balbir Singh, "and said they would beat him if he did not return the money soon."

HARDIP PURI

Tarsem Jodhan, general secretary of the Red Flag Punjab Brick-kiln Workers Union, with Scheduled Caste labourers in Dhaliyan

CHIEF MINISTER Prakash Singh Badal has been putting out a series of curious ideas on how these problems ought to be

solved. At a function in Jalandhar on October 24, he promised to set up "Dalit specific schools" in the State so that Scheduled Caste children could "get quality education to compete for the IAS (Indian Administrative Service), IPS (Indian Police Service) and other services." This proclamation that a *de facto* caste segregation of education would receive official sanction sadly went unchallenged Interestingly, the Ambedkar Academy, set up in Mohali to train Dalit students for the civil services, has not had much success. The number of Dalit students who have made it to the allied services can be counted on one's fingertips; and fingers are not needed to count the number of central services entrants the academy has produced.

Programmes such as the State Government's pet Shagun Scheme pass for Dalit welfare commitments Some Rs.45 crore has been given out since the scheme was put in place after the SAD-BJP came to power, in the form of Rs.5,100-grants to Dalit girls at the time of their marriage Misappropriation

A kiln worker and family outside their makeshift house. Each family puts in 12 days of work at a stretch, and then takes three days off to recover. (Below) Dalit farm workers in Punjab. Low wages in the farm sector are now forcing them to undertake casual labour.

V V KRISHNAN

of funds has been one common complaint Just three Dalit families in Dhaliyan received the handouts, for example, although 20 girls here had got married over the last two years But, more disturbingly, the scheme provides incentives to poor Dalit families to marry their daughters off early rather than keep them in school. Worst of all, the Shagun Scheme provides state subsidies for dowry, and promotes wasteful expenditure.

PUNJAB'S society has had little place for the kinds of violent caste confrontation seen elsewhere in the country. But signs of trouble simmer under the surface. Ten years ago, the State Government provided grants of Rs.60,000 to Mahila Mandals to purchase marquees and cooking utensils. The idea was to allow the Mahila Mandals to generate revenue by renting out these assets for weddings and religious ceremonies. In practice, Dalits found themselves pushed out of the Mahila Mandals in order to ensure that they did not gain access to the utensils. A sur-

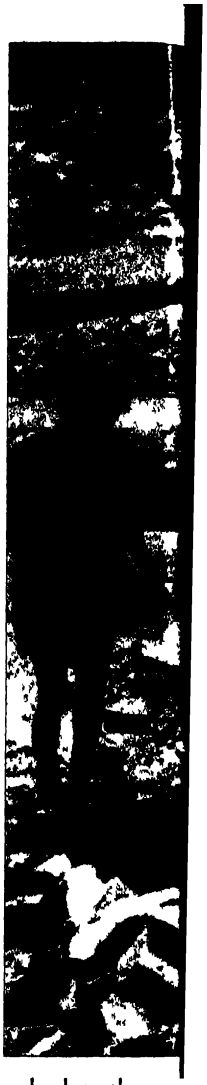
Labourers in Dhaliyan. With combine harvesters displacing agricultural labourers, and machines taking over certain jobs, making a living is becoming difficult for the villagers. (Below) Workers in Ghawaddi village. The wages in some brick kilns seem relatively attractive, but they do not guarantee basic human rights to the workers.

HARDIP PURI



vey carried out by Chandigarh's Institute for Development and Communication (IDC) found, for example, that Dalits made up just 10 per cent of Mahila Mandal members in Jalandhar, and that there was not a single member in Patiala.

The figures do not make pretty reading on other counts either. A study carried out for the IDC by Bhupendra Yadav and A.M. Sharma points to just a few of the stark indexes of deprivation of Dalits in Punjab. Although Punjab has the highest proportion of Scheduled Castes to its population as a whole – at 28.3 per cent – Dalits own just 2.54 per cent of the agricultural land. While the percentage of literates in the State is higher than the national average, its Dalits are less likely to be educated than their counterparts nationwide. School enrolment rates are dismal, and drop-out rates appalling. Amazingly, about 40 per cent of Dalit children in Punjab are likely to be malnourished. Between 1981 and 1991, the percentage of Dalits in Punjab living below the poverty line barely declined, while the numbers of both Dalit and non-Dalit poor actually grew.

Despite their numerical strength, Punjab's traditionally pro-Congress(I) Dalits have had little political power in effect. The rise of the Bahujan Samaj Party (BSP) in the early 1990s appears to have ended. But the SAD-BJP's marked upper-caste biases, and the growing deprivation among Dalits, could soon force a new search for political representation. Recent proposals to remove reservations for Scheduled Castes in the Shiromani Gurudwara Prabandhak Committee (SGPC) provoked bitter debates. A recent Supreme Court order limiting reservations in promotions among government employees sparked vigorous Dalit mobilisation, as well as threats from some employee organisations of upper caste counter-mobilisations.

The four gurdwaras and two temples in Pakhowal village map Punjab's caste terrain. Two gurdwaras are run by upper-caste Sikhs, and two by Dalit communities; both temples, too, are divided on caste lines. It is not as if either temples or gurdwaras would deny entry to members of other castes, but the fact remains they are segregated spaces. If caste tensions have never exploded in Punjab, it was perhaps because prosperity subsumed social tensions. With opportunity narrowing, this peace could soon be questioned. ■

An experiment in empowerment

The path-breaking experiment initiated in Pudukkottai district, Tamil Nadu, to empower women workers by vesting in them the lease rights of quarries suffers a setback owing to official apathy.

MYTHILY SIVARAMAN

QUARRIES in India provide a fertile ground for bonded labour of the worst kind to thrive. In 1990, Sheela Rani Chunkath, the dynamic and gender-sensitive Collector of Pudukkottai district in Tamil Nadu, initiated a path-breaking experiment by giving lease rights of quarries to women workers, vesting the rights with the groups formed under the Development of Women and Children in Rural Areas scheme (DWCRA, a subscheme of the Integrated Rural Development Programme). In her own words, it was "a conscious decision, as it was feared that many of the men were addicted to drink and could be pressured into submission to their old masters." The stage for this initiative was set by the Arivoli Movement (National Literacy Mission), which made the most marginalised sections of the district and their learning skills the focus of public attention.

The sudden rise in the status of the DWCRA groups as a result of the direct ownership of mining rights brought about a sea change in the living conditions of the workers. But it also involved many challenges. Writing on this experience in 1993, Sheela Rani Chunkath noted: "Organising about 4,500 quarry workers and transforming them from atomised workers to self-managing groups is not an easy task. It requires the close cooperation of the government, the group members and social activists... much more has to be done to sustain the process by empowering the women and making them capable of managing their quarries. Only unity can help them face the threat from contractors. Mobilising the entire community is essential to isolate the narrow stratum of vested interests."

How can this experiment be evaluated in terms of the functioning of the DWCRA groups in their new role, the changes in the living conditions, the self-perception of the members and the potential of the experiment to be replicated in quarries across the State? Answers to these queries would help in the effort to abolish disguised bondage in quarries all over the country.

THE women workers proved their competence in handling the quarry business (Arivoli volunteers had organised a programme of intensive training for them) and withstood the contractors' tactics of applying pressure and offering allurements. (The contractors initially coerced local lorry operators into stopping operations for quarries managed by DWCRA groups. This boycott was broken by bringing in lorries from outside the district with the help of the Collector.) Gender equations within the family and at the work site underwent radical changes. The women paid wages to men. And, as they never tire of telling others, they did not pay their husbands and sons the entire wages but only pocket money: the rest of the money was spent on the family's requirements. This and the fact that the weekly wages for a man-woman team went up from Rs.150 to Rs.500 resulted in a rise in their nutrition and clothing levels. That wife-beating became rare, as was admitted by the men and the women, is a testimony to the measure of empowerment the women had achieved. The most heartening factor was that children, who used to work with their parents in the scorching sun, dropped their chisels and hammers to pick up books and pencils. Some of them started going to private schools, paying high fees.

While the experiment got off to a remarkable start, the forces of *status quo* did not remain idle. The number of quarries run by DWCRA groups has dwindled to 60 from 150. About 15 of them hold leases currently and 45 can resume work if their leases are renewed, employing about 900 people; no more.

How did this contraction occur?

When the proactive Collector was transferred in the normal course, the contractors spread panic among the workers by spreading the word that their quarries would be lost and that since they would have to go back to the contractors for jobs, it would be wiser to abide by their wishes. Several quarries slipped back into the hands of contractors to operate on benami basis. The uncertainty over the continuation of the lease and the absence of confidence-building measures from the administration eroded the workers' morale. The most demoralising blow was struck in 1994, when the government, in the name of transparency, passed an order cancelling the system of preferential treatment to certain groups and reverting to the auction system. The government's plea was that benami operations were rampant in cooperative societies all over the State. The Quarry Workers Union, led by two women volunteers of the National Literacy Mission, N. Kannamma and Manikkathai, later noted: "This only resulted in promoting illicit mining once again and caused havoc in the lives of the rural women who had successfully broken away from the shackles of the contractors." The union went to court and forced the government

MYTHILY SIVARAMAN

Women quarry workers in Pudukkottai district. Vesting the lease rights with women has helped many rural women to break free from the quarry contractors.

to extend the lease term first to one year and later to five years.

The Tamil Nadu unit of the All India Democratic Women's Association (AIDWA), impressed by the potential of the DWCRA initiative to emancipate bonded labour, started working closely with the union and negotiated with the government to ensure a more secure and generous deal for the DWCRA groups. In early 1997, AIDWA presented a memorandum to the Chief Minister, to which a number of women's organisations were signatories, urging him to order immediate and longer-term lease renewals to prevent the control of quarries passing back to the contractors. The Chief Minister responded positively, but the Government Order (G.O.) issued subsequently suffered from a number of lacunae, which reflected the bureaucratic insensitivity to the innovative scheme. The order notified that quarries be given to cooperative societies, whereas the DWCRA groups were registered under the Societies Registration Act. The lease payment was to be based on the average auction rate for other quarries and had to be paid in one go. The unkindest blow was the stipulation that the lease period was for one year. Another provision that worried the union was that the Special Committee formed to vet the applications for lease from the societies included the heads of local bodies, who were unfortunately identified with the contractors' camp in the present dispensation. It was a decidedly pro-contractor, non-worker-friendly G.O.

The union presented a detailed counter to the government, pleading for a reversal of the harsh features of the G.O. In 1998, it moved the court to restrain the government from holding auctions for quarries without first renewing the licences granted to its members. It also sought a lease term of five or more years and representation to DWCRA groups on the special committee. In an interim ruling, the court ordered preferential treatment to DWCRA groups for the grant of leases. Four months after the court award, in August 1999, the government issued another order, conceding several of the union's demands. Although belated, this was a victory of sorts for the union. The lease period was fixed as five years and the lease amount was reduced and allowed to be paid in four instalments. As for representation on the special committee, a nominee of the DWCRA group could be invited. The provisions on default are, however, harsh.

The question that troubles the existing DWCRA groups is whether they will get the lease and, if so, when. More than three months after the notification of the latest G.O., the district administration seems to be in no hurry to invite applications. There also appear to be problems in the availability of quarries and also in interpretion of the G.O. as the DWCRA

MYTHILI SIVARAMAN

scheme is known by a different name after it was merged with other schemes. The scenario for those who fail to get the lease is alarming. A woman worker said: "Our children began attending schools only since 1992. We may have to withdraw them from school if we do not get the lease right away. Education is supposed to be free but we have to spend on uniforms and notebooks. We have been living on our new-found hope of educating them. Our children cannot do stone-crushing now as they are not used to working in the sun. The boys will be hanging around, which is very bad." They fear that this situation could lead to early marriage for girls.

Giving quarry leases to workers helped their family budgets. The measure also augmented the State's income: the quarries that were leased to workers were the ones that were not auctioned, and thus the lease amount was an addition to revenue. It also frustrated the strategy of the contractors, who had ensured that auction for two-thirds of the quarries failed (of the 348 quarries scheduled for auction in 1990, there were bids for only 120) and then illegally mined the quarries.

THE workers face several odds. The temple at Kudumiyanmalai is a protected monument. Objections were raised that the blasting of rocks damaged the temple. A recent court order put an end to quarrying activity there. The workers allege that no demand to stop quarrying was made when the contractors did the mining. Govindamma, a DWCRA group leader of a quarry site at Kudimiyanmalai, could not contain herself: "When the rich contractors blasted the stones, how did the temple remain intact? Does the temple get damaged only when the poor workers quarry? Do the gods exist only for the rich? Are we not God-fearing too? The former contractors are probably spreading this canard in order to stop the legal quarrying there, and start illegal mining later." When this DWCRA group had no work, quarrying went on in a nearby site, a part of which, the group leader claimed, belonged to her group but was now mined by a local bigwig with the government turning a blind eye to that.

Mobilising workers at Kudimiyanmalai in Pudukkottai district. Gender equations at work and home have undergone radical changes following steps to empower women. (Below) Women at work in a quarry.

MYTHILI SIVARAMAN

That the DWCRA scheme empowered a few hundred quarry workers to a great extent cannot be denied. A much greater number would have benefited from it had the local administration carried forward the experiment with the zeal that characterised it when it was started a decade ago. It was not given a reasonable chance to succeed by a state, which has legitimised exploitative relations through all its established procedures.

The experiment cannot, however, wait for another committed Collector to take over. Despite the setbacks, it continues to be a tale of firm commitment on the part of the workers, of hard labour, of tremendous self-confidence and determination. Banking on these assets, trade unions, women's organisations and all sections of society committed to empowering the vulnerable sections of people must mobilise their resources and take up the challenge of wiping out immiseration in the quarries. ■

The Harry Potter magic

SUSAN RAM

Harry Potter and the Philosopher's Stone (1997, pages 224, £4.99, paperback); **Harry Potter and the Chamber of Secrets** (1998, pages 251, £4.99, paperback); **Harry Potter and the Prisoner of Azkaban** (1999, pages 317, £10.99, hardback); by J.K.Rowling; published by Bloomsbury, London.

IT has had more than a touch of magic about it. The summer of 1999, for the British publishing industry, was to be the season of Dr. Hannibal Lecter, the fictional serial murderer with a proclivity for cannibalism and fine wines, who was brought to international stardom through the novels of his creator, Thomas Harris, and the movie, *The Silence of the Lambs*. Harris, a slow-paced wordsmith who prides himself on the thoroughness of his research, had at last completed a new Lecter saga. Heinemann, his publishers, came up with the title Hannibal and entered into battle mode, preparing a promotional blitzkrieg that would propel the book beyond the status of a mere bestseller: Hannibal was to be the fastest, biggest selling book of all time.

In June, all seemed to be going to plan. In its first week, Hannibal notched up close to 60,000 copies in sales in the British general retail market, entering the record book as the fastest selling hardback fiction title in recent history. Demand throughout the United Kingdom threatened to outstrip supply; customers at one London bookshop queued up for extra copies shipped in by taxi. Random House, the owners of Heinemann, began projecting hardback sales of half a million.

Then, with the whoosh of a broomstick and a shout of 'Quidditch!', there arrived if not nemesis then a rival from entirely unexpected quarters. A small, on the face of it unremarkable rival: a bespectacled, undersized, unkempt boy on the threshold of his thirteenth birthday, distinguished from the run of boys only by the thin, lightning-shaped scar across his forehead. Even his name, Harry Potter, breathed ordinariness. Yet little Harry, or rather his creator Joanne ('J.K.') Rowling, was about to effect a feat of magic totally belied by his youth and apparent meekness. In a manner expected by thousands of children, in Britain and beyond, who were already familiar with his extraordinary gifts, Harry Potter in July took hold of the publishing industry, shook it and turned it upside down. For week after week thereafter, it would be Harry Potter, not the blood-curdling Hannibal Lecter, who would lord it over the bestseller lists.

THE origins of the Harry Potter phenomenon lie with Rowling's decision, in the mid-1990s, to try her hand at writing children's fiction. There is a magical quality to her own story, a rags-to-riches rise out of unemployment and financial insecurity. She found a publisher, and her first book, *Harry Potter and the Philosopher's Stone*, appeared in 1997 with a print run of just 7,000 copies. Just what happened next is not entirely clear, but it seems that, by word of mouth, from child to child and school to school, the phenomenon began to take shape and grow. The message was simple: against the temptations of television, computer games and the other diversions available to modern children above a certain level of affluence, here was a book that simply had to be read, that children could not put down.

By the appearance of *Harry Potter and the Chamber of Secrets* in 1998, Rowling's publisher, Bloomsbury, was aware of the golden goose it had unwittingly nurtured. So much so that careful planning was set in motion for the launch of the third Harry Potter title in July 1999. A print run of 75,000 hardback copies for the British trade alone was decided and, to justify this level of risk, the eight weeks prior to publication were marshalled into a strategic campaign. Extracts from the book were published in major national newspapers, reviews were arranged to appear in adult book review sections, and Rowling was interviewed in the magazine section of *The Daily Telegraph*. Publication day itself was observed with the ritual normally associated with public examinations: copies of *Harry Potter and the Prisoner of Azkaban* arrived at booksellers' doorsteps, wrapped and sealed, on the morning of July 8, but sales were embargoed until 3-45 p.m. – the end of the school day.

Presented thus, Harry Potter's ascendancy looks a little less than innocent, not quite the story of fresh-faced simplicity triumphing over the smug assumptions of publishing house boardrooms. Further doubts are raised when one confronts the actual content of the books. Even Rowling enthusiasts among her adult readers and reviewers concede that her fiction is essentially formulaic, conforming to conventions of plot, character and setting that other writers for children have sought to move beyond. Yet for all the hype, for all the inherent literary limitations, children love Harry Potter, are excited by his feats, cannot wait for his next adventure. In classrooms throughout Britain (now, too, in the United

States, where the phenomenon has taken hold with similar force) teachers report that Harry Potter has the quite supernatural ability to quieten the unruly, engage the disruptive – and get children reading.

DECONSTRUCTING the Harry Potter phenomenon is easily done. To start things off, take a hero who is both male and vulnerable: with his weedy physique, the orphaned Harry is the quintessential target of bullies, whether in the shape of his unspeakable relatives (uncle, aunt and over-indulged cousin Dudley) or in the form of classroom nasties. Children everywhere instinctively identify with the picked-upon – the more so when the 'victim' proves capable of striking back in all manner of resourceful and unpredictable ways. And this Harry achieves through his access to magic. For he is no run-of-the-mill hero. On the contrary, he is perhaps the most astonishing boy who has ever lived: the son of practising wizards, Harry, when just a baby, managed to confound the evil machinations of the darkest of dark forces. What child reader could fail to be gripped?

With utmost confidence and literary sure-footedness, Rowling places her hero in the setting that has proved a mainstay of children's fiction in the Anglo-Saxon tradition: the British public school. Hogwarts School of Witchcraft and Wizardry, which Harry enters at the age of 11 (and from which he will graduate at 18, thereby guaranteeing a sequence of seven Harry Potter sagas), roots its hocus-pocus and extraordinary goings-on in a familiar framework of prefects, examinations, detentions and competitive sport. Pupils are organised into Houses (named with suitable outlandishness), and there is the well-worn cast of eccentric teachers: the stuttering professor; the strict female teacher with glasses and her hair in a bun; the sinister master darting malevolence with every glance. As generations of writers for children have discovered afresh, the boarding school offers a world in which children, detached from their families, can build new sets of relationships with their peers, but still within a context of adult authority and implicit safety and security.

Rowling's achievement – whether serendipitous or calculated one does not know – lies in combining the boarding school genre of children's fiction with the much more free-ranging, expansive tradition of fantasy and magic. What lifts the Harry Potter books above the status of contemporary Billy Bunter-style larks and wheezes is an engagement with the supernatural that shows imaginative range, narrative skill and the ability to zero in on children's hopes, fears and ways of thinking.

Magic, in the world of Harry Potter as conveyed to his young readers, is fun and also deeply menacing. At one level, it offers and sustains a parallel universe from which non-wizarding adults are excluded, enabling children to unfold their inherent capacities and, where necessary, give insensitive or oppressive adults their come-uppance. Here, there are clear affinities with the children's fiction of Roald Dahl, one of a number of writers whose influence can be discerned in Rowling's work.

But at another level, magic opens a window into a darker world shaped by myths that reach back deep into the history of humankind. In this universe lurk monsters beyond the reach of reason, ready to pursue their prey along limitless nightmare ways. In this universe, too, lie treachery, double-dealing, revelations that stun by their ability to stand old assumptions on their head, the remorselessness and finality of death. In the 20th century, no writer has explored this realm more thoroughly and with more literary effect than J.R.R. Tolkien. Rowling's ventures into it are altogether more modest, but the response to her work underlines its continuing potency. Contemporary children, it seems, crave as much as their forebears did for the terror zone.

Such imperatives may be all too easily forgotten once children cross the threshold of adulthood. This, at least, seems to be the message from South Carolina, where the Board of Education, under pressure from a group of agitated parents, is currently reviewing the use of the Harry Potter books in the state's schools. The suspicion in some Bible Belt quarters is that little Harry Potter is luring his enthralled followers into satanic rites and devil worship; in the view of one horrified mother, the books possess "a serious tone of death, hate, lack of respect and sheer evil".

Any of Harry's readers could have told you what happens next. Harry and his friends Ron Weasley and Hermione Granger, aided perhaps by Rubeus Hagrid, the avuncular school gamekeeper and by Hedwig, Harry's ever useful and obliging owl, will concoct a spell that brings upon the ludicrous South Carolina parents not mayhem but ridicule. And, around the world, thousands of children will raise a cheer. ■

VIJAY PRASHAD

The New Military Humanism: Lessons from Kosovo by Noam Chomsky; Monroe, ME: Common Courage Press, 1999; $15.95.

IN 1959, Noam Chomsky made a landmark attack on B. F. Skinner's behaviourism. Skinner argued that human behaviour, like animal behaviour, was fairly predictable and that it could be controlled. Concerned with the absence of human creativity in this model, Chomsky denounced Skinner's science and also the political implications of his work. Finding behaviourism to be scientifically banal, Chomsky argued that it tells "any concentration camp guard that he can do what his instincts tell him to do, but pretend to be a scientist at the same time. So that makes it good, because science is good, or neutral, and so on." Anti-social tendencies, Skinner believed, could be muted by state action, something abhorrent to the anarchist in Chomsky.

Chomsky's sustained critique of U.S. foreign policy for over three decades comes from his belief in human creativity and his suspicion of the behaviourist assumptions of U.S. imperial pronouncements. The U.S. never claims to attack an adversary in the interest of economic gain, but it has, since its founding in the 18th century, justified its interventions in the name of some higher, frequently moral (and pedagogical), power. James Madison justified U.S. power over the Americas with the concept of Manifest Destiny, and now Bill Clinton adopts the posture of human rights as the design for his overseas adventures. To herald the U.S. bombardment of the Federal Republic of Yugoslavia (FRY), Clinton quoted President Theodore Roosevelt who said that "unless you're willing to fight for great ideals, those ideals will vanish" (page 91). Roosevelt referred to the fight that thwarted the legitimate ambitions of Filipinos, Cubans and Puerto Ricans – all in the name of justice (what Rudyard Kipling called, without irony, the "white man's burden"). If the precedent for the U.S. intervention in Yugoslavia was from the Spanish-American War (1898), then the dictionary may have to be re-written to define anew words such as 'justice,' 'ideals' and 'human rights'.

If one counters the bad faith of the U.S. trumpet of good intentions, one fre-

Demystifying U.S. foriegn policy

quently meets a Skinnerist submission to malevolence. This is the way things are, one is told, for Evil is a tragic inheritance of human nature. "The obviousness of disaster," the philosopher Theodor Adorno wrote in the late 1940s, "becomes an asset to its apologists – what everyone knows no-one need say – and under cover of silence is allowed to proceed unopposed."

Chomsky's sustained critique of U.S. foreign policy for over three decades comes from his belief in human creativity and his suspicion of the behaviourist assumptions of U.S. imperial pronouncements.

Neo-Skinnerism in the guise of Charles Murray and some persons within the Human Genome Project puzzle over those parts of our chemistry and biology that produce evil actions. The idea of Hitler's evilness exculpates processes within Germany from interrogation and de-Nazification. Much the same attitude is taken today with Saddam Hussein and Slobodan Milosevic. These men are seen as the spawn of Evil, ruling autocratically over rogue states. If they are dislodged. through massive violence, then the natural (and neoliberal) goodness of people will be allowed to flourish. The recent biography (*Milosevic: Portrait of a Tyrant*) by Dusko Doder and Louise Branson paints such a simple-minded portrait of the conflict in the Balkans. The processes that led to the crisis in the Yugoslavia or else in West Asia become irrelevant to this sort of blase cynicism.

The leader is Evil. He is the cause of the problem. To remove him is to solve the problem. In broad strokes, this has been the U.S. position on 'rogue states'. Chomsky's new book, *The New Military Humanism*, savages this simplicity to reveal the bad faith with which the machinery of U.S. domination operates. Like his earlier studies, it takes the U.S. statements at face value and then demolishes their truth claims by reference to a mass of data. U.S. National Security Adviser Anthony Lake, for instance, argues that the bombardment of Yugoslavia offers an example of the "saintly glow" of U.S. policy, since the state acted without any special interest for itself beyond its humanitarianism (page 14). "We had to act in the face of Evil: how could we have sat by and watched genocide proceed?" Such sentiments did not emerge during the Rwanda emergency, nor do they come when the US-International Monetary Fund routinely render people economic refugees in far greater numbers than the Kosovo crisis did. International amnesia allowed the Tony Blair-Clinton project to don robes of moral glory, despite the shabbiness of those very garments.

Within the U.S. and in most of western Europe, there is a tussle going on between state-sanctioned xenophobia (mainly through draconian immigration controls) and liberal multiculturalism. Some people want to see states constituted around ethnic purity, whereas others want diversity to be the cultural logic of states. But when it comes to most of the world, the logic of ethnic purity rules the day. The tacit U.S. support for a 'Free Tibet' comes alongside Washington's support for the Croatian ethnocide in Krajina, for the Serb assault on Srebrenica – what U.S. Secretary of State Warren Christopher called "simplifying matters" (page 32). The Dayton Accord and the Wye Rivers Agreement continue the logic of partition of states on monocultural lines, a sure way to perpetuate conflict. Ethnocide and partition produce refugees. Once chaos is produced, has North Atlantic Treaty Organisation (NATO), the European Community or the U.S. come forward as the champion of the ejected people? The 1997 Italian military intervention in Albania was undertaken in order to prevent a flood of Albanian refugees into Italy. The European Union (E.U.) was worried about the exodus of Kosovars into the rest of Europe, but what it failed to see was that the bombardment will certainly lead to intensified migration of Kosovars into Europe, in search of a region that has not been bombed out of modernity. The strong anti-immigration rules in western Europe suggest the lack of humanism in NATO policy.

As the population of refugees increases with each new conflict, one would expect the United Nations to spend more money on the U.N. High Commission for Refugees (UNHCR). However, owing to the budgetary crisis in the U.N. (generated, mainly, by the refusal of the U.S. to pay its dues), the UNHCR eliminated a fifth of its staff in January 1999 (page 37). By the good graces of humankind, the refugees of so many conflicts find the means to survive.

One cannot even offer an approximate figure for the number of the refugees, since the UNHCR recognises the definitional problems involved and the institutional scale at which one would have to work (the UNHCR hired its first professional statistician in 1993 and began its numbers project only in 1994). The UNHCR counts about 11.5 million refugees, a number that cannot be taken seriously if one adds those economic refugees who produce the 'footloose labour' catalogued by Jan Breman and other scholars.

The U.S. slash-and-burn of the U.N. comes as the U.S. puts itself forward as the champion of human rights. If the Rambouillet negotiations are any indication, the U.S. failed grossly on the human rights front. Chomsky, with great pains, goes over the U.S. assassination of the negotiations. Appendix B of the Agreement said that NATO should enjoy "free and unrestricted passage and unimpeded access throughout the FRY including associated airspace and territorial waters" (page 107). No sovereign state can allow that. The Serbian National Assembly resolution passed on March 23 (the day before the attack) spelt out the language for 'political autonomy' that could have been the basis of discussion, but this was summarily rejected by the

U.S. (page 112). Instead, there came the bombardment, which did not so much as alleviate real problems in Yugoslavia, as it intensified the ejection of Kosovo Albanians (page 21, page 81) and destroyed much of the extant civil society (page 133) The Kosovo Liberation Army (KLA) is now the sole authority in Kosovo, along with NATO, and it has driven other forces into the ground. The Serbs, further, are "unified from heaven – but by the bombs, not by God" (noted Alexsa Djilas, page 133). Furthermore, Chomsky notes the wilful destruction of Yugoslavia's infrastructure, notably Vojvodina, a province far from the conflict that was, until its devastation, a centre of democratic dissent (page 34) The New Humanism of NATO can be explained with the following analogy: "Suppose you see a crime in the streets, and feel that you can't just stand by silently, so you pick up an assault rifle and kill everyone involved: criminal, victim, bystanders" (page 156). This is the Blair-Clinton logic for humanitarian intervention.

Chomsky is not averse to humanitarian intervention: indeed he mentions as two credible examples the Indian assistance in East Pakistan in 1971 and the Vietnamese invasion of Cambodia to end the Pol Pot terror in 1978 (page 75). The NATO intervention, however, comes not for humanitarian reasons, he argues, but to sustain the credibility of NATO (page 134 and page 145). Arms producers and dealers, construction companies (who will now 'rebuild' Yugoslavia) and NATO itself gain from the conflict (pages 138-139). Chomsky lays out the bad faith of NATO, but he does not offer political and economic explanations of why the U.S. is so eager to expand NATO at this time. There is no discussion, for instance, on U.S. anxiety over the creation of the euro (a challenge to the dollar), or on the attempt by the European Community to manage its defence itself. Without NATO, the U.S. will lose its leverage over Europe, and it will be not be able to exert itself to the edges of the Russian Federation. Chomsky's overall argument is not affected by these omissions, since he offers a clear and reasoned analysis of the rhetoric and action of NATO, much of it along the grain of Skinnerite behaviourism. One hopes for an Indian edition, not just for this book but for most of Chomsky's political oeuvre, in order to understand better the architecture of the new imperium.■

A comprehensive documentation

M.H. ANSARI

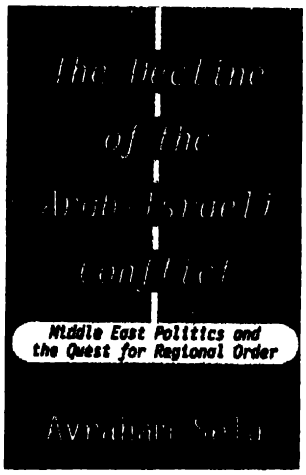
The Decline of Arab-Israeli Conflict – Middle East Politics and the Quest for Regional Order by Avraham Sela; State University of New York Press, 1998; pages xv + 423, $74.50.

SO expensive a book on a subject of relatively receding interest is perhaps unlikely to find a wide readership. Nevertheless, the word 'decline' in the title is bound to arouse curiosity and catch the attention of the student of West Asian politics

Avraham Sela teaches international relations at the Hebrew University in Israel. He explores the interplay between inter-Arab politics and the Arab-Israeli conflict, the inner dynamics of the two as well as the wider dialectic of their mutual interaction on local-regional and global diplomacy. It is, by any reckoning, a serious endeavour (albeit from the other side of the hill) to assess the interplay of these forces on the Arab side. Sela propounds the interesting thesis that the Arab Summit Conference (initiated in 1964), convened to shore up Arab solidarity on the question of Palestine, "in fact legitimised deviation from traditional policies".

What then were these policies? How did they evolve? What were the imperatives inducing deviations? What, finally, is the outcome? The questions assume new relevance in the wake of the Israeli general elections in May 1999, the emergence of Ehud Barak as the leader and the subsequent diplomatic movement suggestive of a rejuvenation of the peace process on all fronts.

The evolution of the Arab state system, or the regional subsystem, is traced by the author to the aftermath of the First World War, the break-up of the Ottoman Empire and the colonial arrangements such as the Balfour Declaration and the Sykes-Picot Pact that followed. A quarter of a century later, the end of the Second World War saw the emergence of the Arab League (1945) as the expression of Arab sentiments for a commonality of purpose and destiny. The origins of the League were suspect in the eyes of some Arab leaders. Abdul Rahman Azzam Pasha, later to occupy the high office of Arab League Secretary-General (and still later to be Saudi Arabia's Agent General in the infructuous Buraimi Oasis arbitration), felt at that time that the League was Britain's "illegitimate new-born child".



Over the years the imperatives of wider Arab nationalism on the one hand and of Arab state particularism on the other ensured a less-than-harmonious evolution of objectives and conduct; they lent credence to the dictum of Prof. Vatikiotis: "Inter-Arab relations cannot be placed on a spectrum of linear development, moving from hell to paradise, or *vice versa*. Rather their course is partly cyclical, partly jerkily spiral, and always resting occasionally at some 'grey' areas." The bedrock nevertheless was the ethnocentric identity of the Arab people and their adherence to a common culture; in the process the boundaries between the nation and the states were often blurred, as was the distinction between *being* a people and *becoming* one.

The superimposition of 20th century ideologies of Pan-Arabism, anti-imperialism, Arab socialism and Islamism (conservative or resurgent) added complexity through additional variables to what in 1945 was perhaps conceived as a Westphalian order in the Arab lands of West Asia. In the final analysis, therefore, five decades of the Arab state system have evolved around the twin foci of inter-Arab competition for regional hegemony and the Palestinian problem.

The purpose of the first Arab Summit in 1964, and of the next two, was to move away from the inter-Arab struggle for hegemony and resort instead to collective Arab action to deal with the river water problem (and the denial of some water to Israel), the establishment of a joint Arab command and the initiation of action to organise the Palestinians politically. The backdrop to this was the radicalisation of the Arab political scene in the wake of the Revolution in Iraq in 1958, the arousal of Pan-Arab sentiments and the resultant

pressures for Arab unity which led to the short-lived unions of Syria and Egypt into the United Arab Republic (UAR) and of the UAR and Iraq.

The failure of these two ventures resulted in bitter ideological and personal feuds: "The battle of rhetoric assumed an ideological character of mutual delegitimisation, employing the Palestinian cause in the service of the rhetoric of national liberation and western domination" (page 46). In this tussle, revolutionary legitimacy lay in radical positions in domestic and foreign policy; it propelled Gamal Abdel Nasser, leader of the leading Arab power, Egypt, to go beyond the inter-Arab coexistence involved in his policy slogan of unity of ranks and advocate instead an interventionist Unity of Purpose approach which soon landed him in trouble with both the radicals and the conservatives.

The Egyptian intervention in Yemen was one result. The contradictions of this entanglement, and the imperatives of Syrian militancy in the conflict with Israel, pushed Nasser, against his better judgment, into the Six Day War of June 1967. Sela observes that "Nasir's (Nasser's) moves ran counter to the positions he had initiated at every Summit meetings: that war with Israel must be postponed until the Arabs attained strategic superiority" (page 90).

THE psychological dimensions of the Arab defeat in 1967, and the deeper reasons for the underdevelopment of Arab societies, have been analysed at lengths by Arab writers such as Sadeq al-Azm and Abdullah Laroui. On the political plane, and amongst politicians, a healthy dose of hard realism was very evident. The Arab Summit convened at Khartoum in August "marked the beginning of a shift of Arab perceptions of the conflict with Israel from one revolving on Israel's legitimacy to one focussing on territories and boundaries" even if it did not involve, at that stage, "the option of a settlement with Israel even in return for the territories" (page 108).

The acceptance of United Nations Security Council Resolution No. 242 by Egypt and Jordan in November 1967 signalled the change. This shift was not embraced by all Arabs; the result was a collapse of the fragile consensus that had developed in Khartoum.

Another summit, badly sought by Egypt and Jordan in their quest for funding from the oil states, remained elusive. The Al-Aqsa incident of August 1969 brought forth a trade-off – a Saudi agreement to an Arab Summit in return for an Egyptian one for the Islamic summit; the latter (September 1969) was boycotted by Syria and Iraq on ideological grounds and the former, which met a few months later, in December, also in Rabat, saw the Egyptian demands being rejected.

Sela's assessment of the supposed motives of the principal Arab players seems melodramatic but is based on Malcolm Kerr's authoritative and classic account of inter-Arab differences: "A bizarre coalition of (Algerian President Houari) Boumedienne and (Saudi King) Faisal, with Iraqi backing, was formed against Nasir, demanding that he go to war or forfeit Saudi aid. Boumedienne's sudden animus was apparently the result of Egypt's coordination with Libya and Sudan, with Algeria viewed as liable to upset the power balance in North Africa. Faisal, in a gambit worthy of Machiavelli, was actually to try to prod Nasir into launching war and thereby be rid of him. Failing this he wished to show that Nasir was insincere about the war option, hence any increase in aid was unjustified. Nasir, however, called the Saudi bluff by announcing that he would go to war if the Arab states undertake to provide the specified economic and military aid. Nasir was well aware that the rich Arab rulers would never agree to transfer the huge sums of money he needed and, in a Machiavellian ploy of his own, may have wished to exploit this certain refusal to justify his adherence to the political solution option he was advocating ever since the Six Day War" (pages 121-122).

The impasse in inter-Arab equations notwithstanding, the Arab summit in Rabat took cognizance of the boost to Palestinian nationalism, which had taken shape in the post-1967 period. The tragic initial consequence of this was soon evident; in the summer of 1970, the Jordanian Army (ably advised by a Pakistani military training mission led by Maj-Gen. Zia-ul-Haq) demolished the Palestinian state within a state in the refugee camps of Amman. More chaos in Arab ranks followed. The United States and Israel got involved in protecting the Hashemite kingdom; diplomatic relations were snapped amidst pressures to reconcile. Financial aid to Jordan was suspended by Kuwait and Libya; a Palestinian, appointed by King Hussein as his Prime Minister, defected; finally, a reconciliation of sorts took place between Hussein and Yasser Arafat at a summit convened in Cairo on September 24, 1970. It was Nasser's final act as an Arab leader; he died the next day. His death signalled the end of the Pan-Arab era and of the collective Arab policy-making.

The new leaders in Egypt (Anwar Sadat) and Syria (Hafez al Assad) were representative of this change. The two shared a new approach to inter-Arab politics – "departure from a compulsive Pan Arabism in favour of pragmatic cooperation" (page 140). The shuttle diplomacy in January 1971 by U.N. envoy Gunnar Jarring in pursuit of Resolution 242, and later in the year of U.S. Secretary of State William Rogers in search of an interim settlement, failed to produce any results whatsoever and virtually led to a complex, seemingly inexplicable, manoeuvre by Sadat. In May 1971, the Egyptian-Soviet Treaty of Friendship and Cooperation was signed; in July 1972 Soviet combat personnel and military advisers were expelled from Egypt. The main significance of the latter move, says Sela, "lay in removing an obstacle to an independent Egyptian decision to go to war" (page 137). This decision to go to war was implemented on October 6 and "was a strategic surprise to Israel". It was preceded by some military coordination with Syria and more substantive political understanding with Saudi Arabia pursuant to which "by the end of August 1973 Faisal informed Sadat that he would be willing to use oil as a weapon in the campaign against Israel provided a war was of sufficient duration for the West to experience the full impact of the oil shortage" (page 143).

Equally surprised was the U.S. administration; Henry Kissinger was to write later in his *Years of Upheaval* about the unimaginable boldness of Sadat's strategy and of its success in transforming the psychological basis of Arab-Israeli negotiations: "Our definition of rationality did not take seriously the notion of starting an unwinnable war to restore self-

respect." Mohammed Heikal, writing many years later, portrayed the Arab perspective: "Above all the Yom Kippur War was the event which relieved Zionists of their self-confidence and Arabs of their humiliation." An Arab leader of modest profile (aptly described by Fouad Ajami as being "free of the chains that tie heroes to their great deed") thus brought the Arab side back into play. What followed is depicted by Sela as "Sadat's serpentine diplomacy" in which he sought to balance his pursuit of Egyptian national interests with the requirement of an Arab consensus.

THE Arab summit in Rabat in October 1974 (and before that in Algeria in November 1973) developed common positions on the conflict with Israel, on the wider diplomatic postures of the Arabs, and on the Palestine Liberation Organisation (PLO) being "the sole representative of the Palestinian people". Even in the absence of Libya and Iraq, differences of perception existed and were papered over. The result was inevitable: "But almost immediately the conciliatory atmosphere gave way to inter-Arab bickering, which side-tracked the Arabs and reduced the pressure on Israel to surrender more of the occupied territories. The foundation of the accord reached at Rabat was endangered because Sadat – with American encouragement – was determined to pursue Egypt's own interests first in disregard to his Arab partners' anxieties and needs, escalating his conflicts with Syria over the peace-making strategy" (page 163).

The Egyptian approach resulted in the Geneva Conference of 1974 ("a historical turning point in the Arab-Israel conflict, highlighted by the President of Egypt's and Jordan's willingness to convene officially with Israel in the same room"), and the signing of the Disengagement of Forces Agreement on January 18, 1974. The U.S. expectation that this would result in the immediate lifting of the oil embargo was belied by a Saudi insistence on progress on the negotiations with Syria. As recorded by Kissinger, "the Arab mini-summit (of February 1974) came up with the face-saving formula that I should take an exploratory trip through the area in February to pave the way for a Syrian disengagement. This was easy to agree to. A month later the oil embargo was lifted." Sela argues that the Syria-Egypt rift after the Sinai II agreement (described elsewhere by George W. Ball as a vast real estate deal in which the U.S. bought a slice of Sinai desert from Israel for a huge financial and political consideration and then paid Egypt for accepting it) polarised inter-Arab politics and "nourished the eruption of the Lebanese civil war" because President Assad of Syria needed "to forge a new regional strategy"; he did this by fostering closer relations with Jordan, Lebanon and the Palestinians "corresponding to the historic notion of 'Greater Syria'" (pages 175-176).

In regard to the events in Lebanon, Arab sources argue that the incident of April 13, 1975 which sparked the Lebanese civil war, was an Israeli plot; even if so, it remains undeniable that the Lebanon of the mid-1970s was an explosive mix in social and political terms, ready to go off at the slightest provocation. Over 50,000 lives were consumed in the conflict that followed. A number of outside actors got involved. Syria argued that it had a right to intervene to safeguard its national security, and the genuineness of this concern appears to have been conceded in a wider circle of states: "The Syrian invasion of Lebanon was preceded by a tacit understanding with Israel, mediated by the United States, on a 'Red Line' delineating their respective spheres of military presence on Lebanese soil. The 'Red Line' understanding was to enhance Assad's regional position and pave his way back to the peace process" (pages 180-181).

The Syrian confrontation with the PLO in Lebanon led to a new inter-Arab alignment and much bickering. An Egyptian-Saudi mediation eventually lent legitimacy to the intervention by the creation of an Arab Deterrence Force (ADF) and then to an Arab Summit in Cairo (and to the resumption of the Egyptian-Saudi-Syrian coalition) in October 1976 in which the new *status quo* was sanctified along with a political commitment to the PLO and financial pledges to the states involved in the confrontation. The stage was thus set for a substantive move by the PLO; this came in the 13th session of the Palestinian National Council in March 1977.

The Arab consensus was not to last. Israel perceived a threat in the idea of a comprehensive settlement being advocated by Arabs within the framework of the proposed Geneva Conference and with the participation of the PLO. This idea was endorsed in the U.S.-Soviet communique of October 1, 1977. In order to counter it, Israel took the initiative for direct diplomatic contacts with Egypt; the mechanism was a secret meeting in Morocco between Foreign Minister Moshe Dayan and an emissary of Anwar Sadat.

The two versions of this conclave differ in their contents; the outcome nevertheless was a bold initiative by the Egyptian leader to go to Jerusalem for direct talks with Begin. The event, which took place on November 20, 1977, shocked the Arab world and the world beyond.

What is more important was the fact that this Egyptian move induced Israel to spell out its own ideas on peace: "Israel sought to reach a separate settlement with Egypt that would remove the threat of an Arab world coalition against it and preserve its grip on the rest of the Arab Territories, mainly the West Bank and Gaza Strip; apart from being willing to withdraw from most of Sinai and most of the Golan Heights, Israel put forward a plan for Palestinian autonomy in the West Bank and Gaza Strip, leaving the issue of sovereignty over these areas undecided. The autonomy idea represented an essential shift in Israel's concept concerning the future of the Palestinian occupied territories" (page 198). This bilateral approach, on Israeli terms, left the U.S. President with little option but to support it. The Camp David Accord was the logical outcome.

After the initial outrage, notes Sela, the absence of uniformity in Arab reactions to the event was evident. Support for Sadat was voiced by Morocco, Sudan, Somalia, Oman and Tunisia; denunciation came from Syria, Iraq, Libya, Algeria, the People's Democratic Republic of Yemen (PDRY) and the PLO; a third group – consisting of Saudi Arabia, Jordan and the Gulf emirates responded with cautious reserve. This three way divide made an exercise in summitry difficult. After much effort and following an Iraqi initiative, a summit did convene in Baghdad in November 1978. It established an Arab Fund of $3.5 billion a year for 10 years for the states involved in the confrontation, the PLO and the Palestinians in the occupied areas and threatened to impose sanctions on Egypt if it signed a formal peace treaty with Israel. Meanwhile, in a significant step, the summit described peace, "a just peace", with Israel as the Arab objective in the conflict.

The Arab consensus itself did not last. "Less than two years after the Baghdad summit, Iraq touched off a war with Iran

and, in the name of Arab interests, split the Arab world and isolated Syria on the Israel front" (page 217). This was preceded by other momentous events in the region: the Revolution in Iran (February 1979), the ascendancy of Saddam Hussein (July 1979), the Iraqi-Syrian rift, and the siege of the Grand Mosque in Mecca (November 1979). The atmosphere was thus far from congenial for the Arab summit in Tunis, which started work on November 20, 1979. Its focus was on minimising controversies; the boycott of Egypt was continued but sanctions were deferred. Also deferred was a proposal to consider sanctions against the U.S. Financial aid to Lebanon and to the states involved, was continued.

Another summit, in November 1980 in Amman, was boycotted by Syria, Lebanon, Algeria and the PLO and this highlighted the divisive impact of the Iran-Iraq war on inter-Arab politics. (The war itself was aptly characterised by Hafez al Assad as "the wrong war against the wrong enemy".) This internalising of the collective Arab effort continued during the Lebanese civil war which was to follow and in which Israel's political and military involvement on the side of Lebanese Christians increased considerably.

THE Syrian historian Constantin Zurayq once remarked that "the failure to understand catastrophes is even deadlier to a people than the catastrophes themselves". The validity of this statement would have been evident to any observer of the Arab condition in the early 1980s. The war with Iran on the eastern front, the ostracisation of Egypt, the plight of Lebanon in the wake of the Israeli invasion of June 1982, and the marginalisation of the Palestinian resistance testified to it.

The 12th, 13th and 14th Arab summits of 1980 (Amman), 1981 and 1982 (both in Fez) dealt primarily with inter-Arab problems rather than the core issue of conflict with Israel. An exception to this was the bold effort made by Crown Prince Fahd of Saudi Arabia in August 1981 to present a set of "guiding principles" for a comprehensive Arab-Israeli settlement. "The Saudi plan was meant to provide an alternative framework to the Camp David Accords, which would gain Arab and international legitimacy through adoption by an Arab Summit Conference and the U.N. respectively.... The initiative was in line with the Saudi doctrine of national security – based on regional stability and tacit alliance with the U.S. – and Saudi national interest in reducing contradictions between their Arab obligations and links with Washington" (page 274). After initial hesitation, "(President) Reagan himself praised it as offering recognition of Israel's right of existence as a nation. The Fahd Plan also won the unreserved support of the EEC's (European Economic Community) Council of Ministers – it had much in common with the Venice Declaration of June 1981 – whose chairman, British Foreign Secretary Lord Carrington, visited Riyadh to discuss it with the Saudi rulers" (page 275).

On the other hand, the intensity of the Arab reaction to the plan could be gauged from the fact that the Fez Arab Summit of 1981 adjourned without discussing it and another summit 10 months later, in September 1982, endorsed an altered version but not before an in-depth discussion of previously unacceptable suggestions like the 1965 Bourgiba proposals (to accept the 1947 U.N. resolution on partition) and Reagan's peace initiative in the wake of the Israeli invasion of Lebanon:

"Still, the Fez Plan constituted a historical precedent in the Arab collective attitude in the conflict with Israel. For the first time, an Arab summit conference resolution on the conflict with Israel not only avoided the use of war terminology, or intransigent rhetoric, it was also non-transitional, departing from the strategy of phases.... Indeed the Arab peace plan was aimed mainly at the U.S. administration, reflecting growing awareness of Israel's strategic preponderance in its conflict with Arabs. More than any other single factor it was the shortfall in oil prices – combined with the burdening economy of the Gulf War – that diminished the Arabs' bargaining position in the international arena and eroded the oil monarchies' willingness to place their national resources at the service of the confrontation actors" (page 284).

Simultaneously, other elements in the equation were sorting themselves out. A dialogue was initiated between Jordan's King Hussein and Arafat. The war in Lebanon, while focussing attention on the Palestinian problem, also led to the dispersal of the latter from their bases in Lebanon. In February 1985, Arafat and King Hussein signed the Amman Accord calling for peace talks under the auspices of an international conference and with the inclusion of the Palestinians in a joint Jordanian-Palestinian delegation. None of this was to the liking of Syria. The Moroccans at this stage sought to square the circle by calling a summit in Casablanca (August 1985) to reconcile the Amman Accord with the Fez Plan; in the final analysis both were endorsed.

Other obstacles to progress nevertheless remained, principally the prerequisites the U.S. prescribed for opening a dialogue with the PLO, Israel's reservations about the nature of the proposed international conference, and the reluctance of the U.S. to involve the Soviet Union in the peace process in a meaningful sense. An emergency Arab summit in Amman in November 1987 ended Egypt's diplomatic isolation. A year later Arafat conceded ground on the question of negotiations with Israel. More important, the start of the Intifada (December 1987) brought a qualitative change in the ground situation: "The uprisings' most important message which became increasingly shared by Israeli society as well as by American decision makers was that the long *status quo* of Israel's occupation of the West Bank and Gaza, as well as the denial of Palestinian national rights, was no longer a viable option. Yet despite the sustained uprising, the parties' cognizance continued to lag behind reality being captive to long-held perceptions" (page 307).

It is Sela's contention that the official responses of the Arab governments to the Intifada "were slow and indecisive"; public sympathy nevertheless was considerable and reflected itself in the financial aid from Saudi Arabia and the Gulf emirates. Once it became clear that the Intifada was a sustained and organised conflagration, the U.S. administration activated itself and produced a plan with "its focus on Palestinian self-rule rather than self-determination" (page 306) with a view to salvaging the Jordanian option. It failed to get off the ground. The Algiers summit (the Intifada summit) of June 1988 reaffirmed its support for establishing a Palestinian state under the PLO's leadership. Seven weeks later Jordan severed its legal and administrative ties with the West Bank and thus furthered the process of the formation of a new state.

The next two summits (in Casablanca and Baghdad) over the next two years saw the return of Egypt to the Arab League and the development of new tensions in Arab ranks leading to new inter-Arab alignment and the formation of regional blocs (the Arab Maghreb Union and the Arab Cooperation Council): "They were indicative of the fading concept of pan-Arab unity" (page 317).

The final push in this direction came with the Iraqi invasion of Kuwait on August 1, 1990. An emergency summit 10 days after the invasion failed to find an Arab solution to the Kuwait crisis and had to condemn Iraq. "By rejecting the idea of an 'Arab solution', referring to international norms and rules and actively following them, the Summit made a step towards internalising those norms and further incorporating Arab states into the world order" (page 328). This was reflected in Gulf Cooperation Council (GCC) secretary-general Abdullah Bishara's remark in February 1991 on the need for a "new Arab order based on legality, mutual respect, non-interference in internal affairs, and the primary role of the economy to create mutual interests." The Kuwait crisis also put an end to the Arab summitry of 26 years.

New forms were developed in its wake to further the Arab quest for a settlement of the dispute with Israel – Madrid, Oslo, and their aftermath. Sela's conclusion is that a new regional order, based on strategic and economic considerations rather than ethno-national identity, is setting in and "represents a clear shift from Pan-Arab regional system, giving way to the state as an independent actor in regional and international politics"; this, he argues, would result in the "routinisation of Israel's relations with its Arab neighbours" (page 350). Fears of hegemony would nevertheless persist in Arab minds, and so would trails of affinity firmly rooted in cultural bonds.

The book is a model of thorough research and careful documentation. A useful appendix summarises the issues discussed and the decisions taken in the 20 summit conferences between 1964 and 1990. Another appendix indicates the level of the participating Arab states in each of these summits. The author set out to fill a gap in the existing literature on the history of regional Arab politics; the book achieves this goal in good measure. Its comprehensiveness would have been enhanced had more details been given of the domestic debate in Israel on negotiations with the Arabs, and the imperatives for it. Perhaps someone in the Arab world would overcome the familiar inhibitions about current history, supplement Mohammad Heikal's effort in his *Secret Channels*, bring forth a comparable Arab survey of these events and, as Ibn Khaldun might have said, "lift the veil". ■

BOOKS

The bomb as teacher

A. G. NOORANI

Cold War Statesmen Confront the Bomb: Nuclear Diplomacy since 1945; edited by John Lewis Gaddis, Philip H. Gordon, Ernest R. May and Jonathan Rosenberg; Oxford University Press; pages 398, Rs.1,075.
South Asia on a Nuclear Fuse: Nuclear Politics and the Future of Global Disarmament by Praful Bidwai and Achin Vanaik; Oxford University Press; pages 354, Rs.595.

IT is true that the nuclear powers were armed to the teeth when India tested a nuclear bomb on May 11, 1998. It is equally true, however, that India decided to take the plunge precisely when a powerful tide of international public opinion had turned against nuclear weaponry. Who would have thought that a day would come when Paul H. Nitze would write: "I see no compelling reason why the United States should not unilaterally get rid of its nuclear weapons. To maintain them is costly and adds nothing to America's security. I can think of no circumstances under which it would be wise for the United States to use nuclear weapons, even in retaliation for their prior use against it" (*International Herald Tribune*; October 29, 1999).

The Bharatiya Janata Party-led Government inherited a recessed nuclear deterrence in India known to the wide world. None of the reasons it cited in justification of Pokhran-II made sense. Eric Arnett of the Stockholm International Peace Research Institute (SIPRI) did not find India's plea of the China factor convincing ("Nuclear questions and issues" by the writer; *Frontline*, February 26, 1999).

Two committed and informed activists against the bomb, Praful Bidwai and Achin Vanaik, hold that it was part of India's drive to "ruthlessly pursue its global ambitions to become a Great Power." The spread of the Sangh Parivar's influence lent the drive a saffron hue. The decision was not taken in the national interest but to buttress a shaky coalition at the Centre. Lt. Gen. Eric A. Vaz has said that the armed forces were not consulted before this fateful move (*The Times of India*; October 25, 1999).

The draft Indian Nuclear Doctrine, prepared by the Nuclear Doctrine Group of the National Security Advisory Board of the National Security Council and released to the press on August 7, 1999, confirms the view that what the advocates of the bomb aspire to is status in the name of security. Their "triad of aircraft, mobile land-based missiles and sea-based assets" goes far beyond "minimum nuclear deterrence." It is open-ended, wasteful and spells a ruinous nuclear arms race in the region. Aspirants to great power status care little to learn from the experience of the nuclear powers in their ardour to emulate the tragic example they set.

But the bomb is a great teacher, as the volume of essays edited by distinguished historians demonstrates. It is a study of what ten Cold War statesmen thought about nuclear weapons and how these weapons, in turn, shaped their thinking. The essays deal with Truman and Stalin and their respective successors, Eisenhower, John F. Kennedy and Nikita Khruschev. Ike's powerful Secretary of State John Foster Dulles and the leaders of allies of the two superpowers – Churchill, de Gaulle, Adenauer and Mao Zedong – are not overlooked.

The fall 1988 issue of *International Security* published (pages 55-79) Prof. John Mueller's seminal article, "The Essential Irrelevance of Nuclear Weapons." It concluded that "nuclear weapons neither crucially define a fundamental stability nor threaten severely to disturb it." They did not help to drive the Soviet Union out of Iran in 1946, as Truman believed; nor impelled China to negotiate a peace accord in Korea in 1953, as Ike believed.

John Mueller wrote: "Much the same could be said about other instances in which there was a real or implied threat that nuclear weapons might be brought into play; the Taiwan Straits crises of 1954-55 and 1958, the Berlin blockade of 1948-49, the Soviet-Chinese confrontation of 1969, the Six-day War in 1967, the Yom Kippur War of 1973, Cold War disagreements over Lebanon in 1958, Berlin in 1958 and 1961 and offensive weapons in Cuba in 1962. All were

resolved, or allowed to dissipate, at rather low rungs on the escalatory ladder. While the horror of a possible nuclear war was doubtless clear to the participants, it is certainly not apparent that they would have been much more casual about escalation if the worst they had to visualise was a repetition of the World War II.

"Of course, nuclear weapons add new elements to international politics: new pieces for the players to move around the board (missiles in and out of Cuba, for example), new terrors to contemplate. But in counter to the remark attributed to Albert Einstein that nuclear weapons have changed everything except our way of thinking, it might be suggested that nuclear weapons have changed little except our way of talking, gesturing, and spending money."

The thesis was fully developed in his book *Retreat from Doomsday: The Obsolescence of Major War* (1989).

These essays aim to promote debate about Mueller's thesis. His propositions are not, and cannot be, tested in any remotely scientific way. "There are logical grounds for questioning whether historical evidence can ever be used to test propositions about statecraft," writes Prof. Ernest R. May, the eminent historian of diplomacy. "As the reader will see, all the statesmen treated in this book displayed ambivalence with regard to nuclear weapons and nuclear war. At one time or another, each spoke or wrote of nuclear weapons as weapons that might actually be used and yet, at some other time, spoke of nuclear war as impossible or unthinkable."

The essence of nuclear deterrence, May points out, is to establish some degree of credibility for an inherently incredible threat. The essay on Truman shows how his education progressed. "Civilisation cannot survive an atomic war. Nothing would be left but a world reduced to rubble," he said on May 11, 1946. After initial vacillation he insisted firmly on keeping nuclear weapons under civilian control. On September 16, 1948, the National Security Council (NSC) adopted NSC 30, laying down the basic policy. Decision on use of nuclear weapons was left to the President. But the conditions in which they would be used were not defined.

It was Truman who decided to drop atomic bombs on Hiroshima and Nagasaki and to develop the hydrogen bomb. But he was resolutely opposed to extending the Korean war. Till the last he never defined clearly "the conditions, no matter how extreme, under which he thought that it would become necessary for the United States to use nuclear weapons." More likely than not, the omission was due to his belief that they were simply unusable.

DULLES strongly disapproved, on moral grounds, the atomic bombing of Japan and warned at the time of the dangerous precedent it set. North Korea's attack on the South in June 1950 removed his reservations. By 1953, both Eisenhower and Dulles talked about the possibility of use of nuclear weapons to shorten the war. "Setting atomic weapons apart from all other weapons" was wrong. The "false distinction" must be erased. At an NSC meeting in December 1953 Dulles "advocated the actual use of atomic weapons" against China if it resumed hostilities. In late 1954 he said that a "general war would threaten the destruction of Western civilisation;" yet, he made a sharp distinction between the tactical and strategic use of nuclear weapons. Dulles thus became a "nuclear schizophrenic". He dreaded the consequences of use but urged its use now and then.

During Eisenhower's presidency, nuclear strategy and foreign policy were truly integrated at a high policy level. Seven of the 13 nuclear crises occurred when he was President – end to the Korean war, 1953; the Indo-China crisis, 1954; Quemoy and Matsu, 1954-55; Lebanon, 1958; the second Quemoy and Matsu crisis, 1958; and Berlin, 1958-59. The other six were Berlin, 1948; Suez, 1956; Berlin, 1961; the Arab-Israeli war of 1973; and the Carter Doctrine (1980).

Abba Eban records that on at least three occasions in 1964 and 1967, U.S. military chiefs sent memos to President Lyndon B. Johnson and Defence Secretary Robert McNamara urging them to consider use of the nuclear option in North Vietnam and in southern China. "These memos by the military leaders in the United States are an antidote to the facile assurance that there was never any danger of nuclear explosions during the Cold war" (*Diplomacy for the Next Century*; 1998; page 107).

From 1953-55, Ike regarded nuclear weapons as "the pre-eminent component of American national security policy". The rapidly expanding H-Bomb potential and the recurring crises induced second thoughts. During the first phase, there is compelling evidence that Eisenhower "was not bluffing".

The year 1956 marked a turning point in his thinking, and in Khruschev's too. In a letter to a friend on April 4, 1956, Ike wrote: "We are rapidly getting to the point that no war can be won. War implies a contest; when you get to the point that contest is no longer involved and the outlook comes close to destruction of the enemy and suicide for ourselves – an outlook that neither side can ignore – then arguments as to the exact amount of available strength as compared to somebody else's are no longer the vital issues.... But I repeat that (arms) usefulness becomes concentrated more and more in their characteristics as deterrents than in instruments with which to obtain victory over opponents as in 1945."

To quote a pithy expression he used later, "Destruction is not a good police force." Sobriety marked his response and that of Dulles to Khruschev's moves on Berlin in 1958-59.

JOHN F. KENNEDY inherited this awareness and it marked his adroit and responsible handling of the Cuban missile crisis in 1962. Nikita Khruschev began as one who, along with Molotov, attacked Stalin's successor Georgi Malenkov for asserting, on March 12, 1954, that "considering the modern means of warfare would mean the end of world civilization". Malenkov retreated to hold that they would lead only to "the collapse of the whole capitalist system". Later, Khruschev told Egyptian journalist Mohammed Heikal that he became convinced that "we could never possibly use these weapons and when I realised that I was able to sleep again".

But what of the master of them all, Stalin? He "created in just three years a gigantic new complex capable of competing with the United States". He knew that "until the 1950s the United States had no capacity for an atomic blitzkrieg".

The Russian historian Vladislav M. Zubok, who has delved in the archives diligently, writes: "Some of the National Intelligence Estimate, prepared by the CIA, reached Stalin's desk, and in the fall of 1951 at least several NIEs dealt with the consequences of a U.S. air strike against the USSR. It is important to understand: America plan-ned to drop atomic bombs on the Soviet Union to defend Western Europe. But Stalin saw those plans as a threat to destroy him in a surprise attack, just as Hitler had sought to do." Intelligence of the debate in the U.S. leadership on the use of nuclear weapons reached the Kremlin and influenced Stalin's successors to douse the fires

of the war in Korea.

Zubok holds that "America's atomic monopoly did not play a substantial role in deterring Stalin in the first phase of the Cold War. He knew that the U.S. atomic arsenal was not sufficient to destroy the Soviet Union. Stalin was determined to defend his spheres of influence and to dispel any sign of possible Soviet weakness in the face of America's atomic sabre-rattling. At the same time, he was firmly convinced – along with most of his ministers and scientists – that only a similar force could deter the United States from using its atomic weapons again. And he was also concerned that, if the Americans learned about the Soviet crash programme, they might attempt to destroy it."

Winston Churchill was another zealous convert who moved from initial advocacy of use of the bomb, before the Soviet Union acquired it, to fervent pleadings for parleys at the summit for a rapprochement. But he, like de Gaulle, was as ardent in the acquisition of a national nuclear deterrent. "We've got to have the bloody Union Jack flying on top of it."

Mao began by declaring in 1946 that "the atomic bomb is a paper tiger which the U.S. reactionaries use to scare people." He was too nationalistic to accept Khruschev's offer of a nuclear umbrella and opted instead for a "paper tiger" manufactured in China.

THE historian of the Cold War, John Lewis Gaddis, sums up the appraisals. During the Cuban missile crisis the U.S. had a 17-1 advantage over the Soviet Union in strategic weapons. It compromised, nonetheless. "One can read the evidence, as Mueller does, to suggest that nuclear weapons were irrelevant to the outcome of the crisis. An alternative reading, though, is that they were supremely relevant; that they had so changed the nature of warfare that even a 17-1 advantage in military capability could not ensure victory; that balances of military forces themselves had become irrelevant; that when the capacity existed to get *only a few nuclear weapons through*, deterrence would have been achieved. Mao and de Gaulle appear to have understood this instinctively: it was enough to have just a few. What Kennedy discovered – and this may well have been the most significant implication of the thermonuclear revolution – was how little good it did to have many. The evidence is compelling, then, that the thermonuclear revolution really did make a difference" (emphasis as in original, throughout).

Gaddis is against nuclear proliferation, though:

"There is clearly a point of diminishing rationality, even when it comes to the unconventional logic of nuclear deterrence; we would be most unwise to assume that because that logic crossed the cultural barriers that separated the Americans, the Russians, the Europeans, and the Chinese during the Cold War, it can cross all such barriers.

"But there is another consideration as well, the significance of which we are only now beginning to appreciate. It is that the world was extraordinarily lucky during the Cold War. There were no accidental detonations of nuclear weapons....

"We conclude, then, that nuclear weapons did play the determining role in making great-power war obsolete, at least during the Cold War. And it seems reasonable to assume that as long as the great powers continue to possess nuclear weapons – even if in far smaller numbers than in the past – that deterrent effect will continue. That it will do so for all times and in all places, though, seems a very shaky proposition. What we have here, then, is the presumption of a confirmed contingent generalisation. That is about as far as we would want to go."

John Mueller, fairly enough, is given an opportunity to respond, in an Epilogue, to criticisms of his thesis and he does so with verve. "I readily acknowledge that nuclear weapons helped leaders change their views about the utility of force at least as it pertained to major war and therefore, to that degree, I agree that nuclear weapons had a stabilising effect. I maintain, however, that, while this change may have been *notable*, it was not *consequential*: the Cold War figures examined in this book would deem a World War III prosecuted *without* nuclear weapons to be an excruciatingly bad idea, while they would deem a World War III carried out with them to be an unbelievably excruciatingly bad idea."

IF civility marks this debate, acerbity and exaggeration animate the Bidwai-Vanaik volume, not to forget some sloppiness in providing references. Sample this on the false pleas in defence of Pokhran-II: "Wild imagination, flights of fancy, semi-literacy in strategic affairs, pure prejudice, misinformation, inaccuracies, half-truths, and outright lies were blended in varying proportions to churn out this smorgasbord of apologia to suit different hawkish tasks and cater to various notions of national 'pride' and hubris."

Surely, if L. K. Advani and George Fernandes "demanded that Proud New Nuclear India must 'recapture' the part of Kashmir that Pakistan illegally annexed," the source for the quote should have been provided.

This is a pity. For, bar its excesses, theirs is essentially a plea for nuclear sanity. Even nuclear doves and staunch critics of Pokhran-II turn hawkish once the Pakistan factor is brought in. No praise can be too high for the courage and integrity with which Praful Bidwai and Achin Vanaik acknowledge Pakistan's genuine security concerns and India's persistent refusal to reckon with them.

"... we need only ask what the Indian reaction would be if China were to announce that it was supplying two complete nuclear reactors to Pakistan, its most advanced fighter aircraft, and the signing of a 10-year military supply commitment to be known as a 'Strategic Accord'? It is hardly difficult to imagine what the reaction would be; there would be an uproar in India. Yet this is exactly what the Russians have committed themselves to doing with India."

Such objectivity and candour are rare. Vajpayee may not have "teased, chided, insulted, threatened Sharif in the last week of May" 1998 by staging Pokhran-II, but he assuredly drove it to stage a comparable folly in Chagai and blazed the trail for a ruinous nuclear arms race in South Asia. Not many realise that. The authors' fury reflects their awareness of what lies in store for us in the future. Unlike the Washington-Moscow and Moscow-Beijing nuclear contests, New Delhi and Islamabad subsist "on a short fuse"; far shorter than most realise. ■

Rethinking development

C.T. KURIEN

OVER the years I have become a regular reader of the World Bank's annual publication, the World Development Report (WDR). I find it a very useful compilation with a text on a carefully selected theme, made lively with charts, graphs and boxed items of an anecdotal nature, an extensive bibliography and selected global statistics. The latest WDR is no exception. The 22nd in the annual series, it is, in fact, more impressive than usual. The theme "Entering the 21st Century" is most appropriate and the text runs to 175 pages; the bibliography has over 800 items; and the statistical Appendix has selected indicators on the main sub-themes dealt with.

A brief statement of the thrust of WDR 1999/2000 and the issues selected for treatment will be useful before I turn to a couple of comments. The Overview and the Introduction put forward the idea that as nations and peoples enter the 21st century they will be confronted with the twin forces of globalisation and localisation. Of the two, much has already been written about globalisation, the economic and financial linking up of national economies which opens up new possibilities, but also presents new types of problems. In its present form, globalisation is a phenomenon of the past two decades. Localisation is relatively new and hence not as familiar a phenomenon as globalisation. WDR 1999/2000 describes localisation in several places as reflecting the growing desire of people for a greater say in their government, manifesting itself in the assertion of regional identities. Thus, globalisation is a supranational economic phenomenon with political overtones while localisation is a subnational political phenomenon with economic implications. Since both are being viewed from the perspective of nation-states, they may also be designated as an external opening up and an internal opening up (as I have stated elsewhere). As we enter the 21st century, development will have to be reconceptualised in this new context. This is the thrust of the document. It is elaborated in Chapter 1 where the need to increase international trade, investment and migration, and to protect the global environment are emphasised as far as globalisation is concerned, and in relation to localisation the role of subnational units of governance is brought out with special reference to the economics and the governance of cities.

Chapter 2 deals with the World Trade Organisation (WTO) and its role in the 21st century. Chapter 3 is an account and evaluation of the global financial system. Chapter 4 discusses the global environmental issue. From aspects of globalisation in these chapters, Chapter 5 moves on to localisation, especially an evaluation of governance in a multi-tier system. Chapters 6 and 7 are about urbanisation. This is a new theme that the WDR is entering into. The concluding chapter has some case studies pertaining to the themes taken up in the earlier chapters.

FOR a more substantive treatment of these themes, I shall work backwards, beginning with urbanisation, to be followed by localisation and then moving on to the central theme of rethinking development in the context of the globalisation-localisation dynamic. In a way urbanisation is a concrete manifestation of that dynamic. In 1975, just over a third of the world's population lived in areas classified as urban. At the beginning of the 21st century, it will be as high as one half and by 2025 it may well become two-third, this rapid change affecting developing countries far more than the rest. Some 1.5 billion more people becoming urbanites in the countries of Asia and Africa will be a major challenge, physical and socio-political, in the years ahead.

Urbanisation is a typical instance of the interface between globalisation and localisation. The trade, investment and growth impulses that globalisation brings are the stimulants for the kind of galloping urbanisation that developing countries are likely to experience in the 21st century, which will bring in its wake a wide range of problems. Infrastructural inadequacy – housing, water and sanitation, transport, education and health – will be the chief among them. There are no global or even national solutions for them. Solutions have to be found at the local level; but apart from local insights, national and supranational insights and even resources will be required to deal with them. National governments, international agencies, local organisations of citizens can all be mobilised to diagnose and solve such problems. The crucial issue is the pattern of governance at the local level.

In my perception, the two chapters on urbanisation are the main contributions of WDR 1999/2000. The chapter on localisation that flags some of the issues discussed in these chapters is insightful, but suffers from an ambience of vagueness. This is not surprising. Chapter 5 on localisation deals with all forms of "subnational" governments which include (as shown in Table 5.1 of the Chapter) States (or provinces) in large federal entities such as the United States, India, Mexico, the Russian Federation (where the subnational units are republics); the lower units within them (such as municipalities and panchayats in India); smaller national entities such as the U.K. where the sub-units, the counties, have their own distinctive features. With such diversity, what can be said about localisation in general?

It would appear that the World Bank and its WDR are just waking up to some facts of life. The world, fortunately or unfortunately, is not a single, simple, homogeneous entity as it may often appear from 1818 H. Street, N.W., Washington D.C., U.S., the headquarters of the World Bank. Those who work there and those associated with the preparation of WDRs in the past may have proceeded on the assumption that from the "heights" of the headquarters it is possible to have a "global" view of the ground realities. They may have assumed also that on that basis it would be possible to prescribe standard, packaged universal remedies, such as marketisation and privatisation, and their derivative called structural adjustment programme, for problems anywhere and everywhere in the world. The fact that a Fund next door had the same perception may have given them greater assurance to campaign aggressively for their viewpoint. But what if that aerial view was from too far a height that obliterated all ground realities? Indeed, what if what was thought to be a bird's eye view was only a worm's eye view?

BE that as it may, WDR 1999/2000 has indications that the World Bank and its experts are willing to be a little less dogmatic about development as they look towards the 21st century. These can be found throughout the document, but more particularly in the treatment of development in the introductory chapter. It is seen in the statement that "the principal goal of development policy is to create sustainable improvements in the quality of life for all people" (page 13). Gone is the insistence that development is primarily economic growth and that it can be measured in terms of per capita income. The emphasis on quality of life and its sustainability and the statement of the fact that it is for all people, is a major departure (whose significance would have been striking if "all" were to be given in italics). There is the frank and documented admission that growth does not necessarily percolate down – the evidence being that the ratio of per capita income between the richest and poorest countries increased sixfold between 1870 and 1985. It is conceded that while investment is crucial for growth, cross-country comparisons suggest that some low-investment countries grew rapidly and a number of high-investment countries had low growth rates. And, there is the stark statement: "Governments play a vital role in development, but there is no simple set of rules that tells them what to do" (page 13). These candid statements move on to the following conclusion, equally frank and open: "Understanding the process of development requires acknowledging both its complexity and the context in which it operates" (page 30).

The Report takes a positive step in suggesting that the alternative approach to development may be what the Bank has turned to recently, and what has been designated "Comprehensive Development Framework (CDF)" whose main features are spelt out as follows: "The country, not assistance agencies, should own its development strategy, determining the goals, timing, and sequencing of its development programmes."

Governments need to build partnerships with the private sector, non-governmental organisations (NGOs), assistance agencies, and organisations of civil society to define development needs and implement programmes.

A long-term, collective vision of needs and solutions should be articulated that will draw sustained national support. Structural and social concerns should be treated equally contemporaneously with macroeconomic and financial concerns (Box 4 on page 21).

It is stated that CDF is meant to be a compass, not a blueprint, and that the way the principles are put into practice will vary from country to country, depending on economic and social needs and the priorities of the stakeholders involved. If these statements are taken seriously, they point to a major departure in the approach to development, at least of the official international agencies, conforming to the position taken by some other official international agencies – the United Nations Development Programme, for instance, in its annual Human Development Report. It is also in conformity with the views on development advocated for several decades by development economists, including the present writer – although for the World Bank, CDF is "only at the pilot stage".

In view of my own involvement with a CDF-like approach to development, I may indicate why the World Bank is not likely to succeed in actualising the new vision of which it has now some glimpses. The reasons are twofold, which I shall refer to as methodological and ideological.

ON the methodological front the problem is the relationship between the concrete and the abstract. Developmental problems are concrete (millions of people not having adequate food, let us say) and the solutions are concrete too (making food available to them). But in order to understand the concrete problem and decide on its solutions it is necessary to go through some procedure of abstraction – simplification, classification, ordering and the like – procedures needed for the diagnosis of the problem. In dealing with the problem of development, the World Bank has proceeded on the assumption that there is an *a priori* knowledge of what it is (level of per capita income) and that comparisons of the developed and the developing would show what its causal correlates are (investments, trade, fiscal policies, incentives and so on). But once it is conceded that the goals and the processes of development are to be defined by those directly involved, this procedure simply breaks down. Further, in the concrete the correlates do not exist in isolation. They are inter-related and interact in ways that cannot be easily anticipated. This is what makes development inherently complex. The World Bank, whose analysis of problems is derived from what is in common for individual cases, can only have a generalised understanding of the problem which is not adequate to deal with a specific concrete case. In fairness it must be admitted that the Bank now makes fairly thorough-going case studies like the five given in Chapter 8. It is interesting to note that in the analysis of the past in each case, the World Bank is able to discover the general principles it has enunciated, but when it comes to directions for the future it cannot say what the appropriate course of action should be. A physician with the knowledge of human physiology and medicines alone may not be able to diagnose the health problem of a particular patient without thoroughly examining him or her to arrive at a diagnosis and then to suggest the remedy. The situation is similar to a global agency which has some general knowledge about types of problems, but is not familiar with the concrete case it is dealing with. In the circumstances that agency may pass on available information to its constituents, invite them to consider possible alternatives, promise them scholarly assistance if they so desire. But it should not presume to prescribe, for, to prescribe without proper diagnosis is dangerous.

This is a serious problem for the World Bank which must at least pretend that as a global agency with global expertise at its command, it knows everybody's problems and has remedies to suggest. But the Bank has a bigger problem. Its advice is substantially to developing countries. Its ideological position, however, does not allow it to accept the fact that many of the problems of the developing countries can be directly related to the positions and actions of the developed countries and powerful global agencies.

Just one example will do to drive home this point. In the context of the growing influence of global finance, the Bank advises developing countries to be transparent in their financial and banking operations. But is that possible and is that wise if global financial players have no transparency and accountability? Who is to "advise" them? Under whose authority do they function? Are there systemic reasons for the inability to exercise control over them? The World Bank, because of its ideological position, cannot seriously enter into these questions and may not even think it necessary to do so.

Hence, even if the World Bank is finally convinced about a new paradigm of development, it may not be able, in practice, to move out of its old imperatives and procedures. After all, can a leopard change its spots? ■

On separated hands

WILLIAM SAFIRE

I AM not in the least superstitious, but I know enough not to open an umbrella indoors, leave shoes on a table or a hat on a bed, touch somebody with a broom or rock an empty rocking chair. When any of these sure-fire invitations to misfortune occur, I – like anyone who hears a sneeze – say, "Bless you!" The latest medieval research tells us that this phrase – in German, *Gesundheit*, "a state of good health" – keeps the Devil from possessing your soul.

But folklorists know there are more specific expressions that are used to ward off evil in special situations. At a gathering of media biggies, I posed this query to Corinne Boggs Roberts: When you are walking along hand in hand with a friend, and an obstacle like a tree or a lamppost forces you to break your handclasp momentarily, what expression do you use to ward off a quarrel or, worse, permanent separation? Without hesitation, Cokie, as she is known to intimates, replied, "*Bread and butter*."

Peter Bartis, at the American Folklife Center of the Library of Congress, explains, "*Bread and butter* go together, a sign of unity." He finds a citation in the seven-volume Frank C. Brown Collection of North Carolina Folklore: "If two persons are walking and they come to an object (high object) in their path, and one goes on one side and one on the opposite side, they will have a fuss."

A California source shows the expression to be national: "When something goes between two people while walking, and nothing is said afterward, the two will quarrel."

Thousands of bytes of e-mailed expostulations will be onloaded to my head from folklorists certain that the only expression to be used in that case is *needles and pins*. Hold your ire. According to a 1920s usage cited in the Dictionary of American Regional English (DARE), when two people accidentally said the same thing in unison, "one would then say 'needles' and the other 'pins,' then hook little fingers and make a silent wish." (I used to say "Snap!" before hooking pinkies. Today I say, "Great minds think alike," and eschew the digital signals.) "When walkers were separated and did not use this phrase or *bread and butter*," DARE adds, "it was believed they would have a quarrel."

"SEN. John Kerry has an affinity for the vice president's positions," writes Carey Goldberg in *The New York Times*, "and is friends with him."

That locution grates on the ears of a reader. "Since we have never met," he writes, "it follows that I am not *friends with* you." He finds his singular *I* ill fits the plural *friends* and prefers to put that as the all-plural "we are not friends" or the all-singular "you are not a friend of mine."

'Friend of' refers to an established relationship. 'Friends with' gives the connotation of 'friendly toward,' referring to the attitude rather than the firm relationship.... 'I'm friends with her' is not incorrect. 'We're friends' or 'she's a friend of mine' is unassailable in any company.

I checked with the usagist Jacques Barzun, who is a friend. He is untroubled by the number disagreement of this spreading idiom but finds a shade of difference in meaning: "*Friend of* refers to an established relationship. *Friends with* gives the connotation of 'friendly toward,' referring to the attitude rather than the firm relationship."

There is also the element of abstraction. *Friends with* is an outgrowth of *friendly with*, implying interaction between people. You can be a *friend of* the Constitution or a *friend to* man, but you cannot be *friends with* either abstraction.

"I'm *friends with* her," in my book, is not incorrect, but is informal. "We're friends" or "she's a *friend of* mine" is unassailable in any company.

IN a reminiscence of the late Judith Campbell Exner, a put-upon paramour of President Kennedy, I wrote that "responsible newspapers subsequently revealed that (Sam) Giancana, the woman's Chicago lover, was also the Mafia don who took a contract from the CIA to assassinate Fidel Castro."

A careful reader questions my use of the verb *reveal*. Wouldn't a better choice have been *disclose* or *divulge*? The root of *reveal* is the Latin *velum*, "veil"; to *reveal* is to strip away the veil. The early use of *revelation* had to do with the unfolding of divine will or the making-known by some supernatural agency. That meaning still clings to the central sense of the word today; to *reveal* is to allow a vision of what is beyond the range of ordinary human reason or sight.

Disclose is its workaday synonym; no heavenly choir is singing in the background. The root meaning is "to unclose," which means "to open"; the most common sense is "to make known what was previously unpublished, deliberately held back or kept secret."

Divulge can be tracked back to the Latin *vulgus*, "mob"; it means "to make known to the multitude," with the whiff of a suggestion that the informant should have kept his information to himself. It implies either a breach of confidence or other impropriety in the communication. (I like Merriam-Webster's New Dictionary of Synonyms,, but will not *divulge* my source.)

"When I was a writer (called 'contributing editor') on *Time* magazine," notes another reader, "the managing editor was T.S. Mathews, a brilliant man. He always struck out *revealed* ('The sergeant *revealed* that no gun had been found on the scene') and substituted *disclosed* or just plain *said*. According to Mathews, *revealed* was 'reserved for the five books of Moses and the poetry of William Blake.'"

I'll go with that. Not every full disclosure is a full revelation. ■

Red tape in the time of IT

The idea behind the creation of a Ministry of Information Technology appears to be conceptually flawed: a bureaucratic behemoth may not be the agency best suited to facilitate the growth of this sector.

R. RAMACHANDRAN

SEVENTEEN months after Prime Minister Atal Behari Vajpayee gave a call to make India an "Information Technology Superpower" and one of the largest generators and exporters of software in the world within 10 years, the Government created a Ministry of Information Technology (MIT) in October 1999.

However, is the new Ministry, with all its bureaucratic trappings, the agency best suited to provide the much-needed push for IT and facilitate the growth of this sector, as envisaged by a high-power National Task Force on IT and Software Development that was constituted the very day Vajpayee gave the call. The impression has gained ground that the Ministry was created in order to kill two birds with one stone: to handle the pressure from the Indian Administrative Service lobby to overcome stagnanation in its upper rungs, and to pander to post-election forces and exigencies.

The 20-member Task Force was constituted on May 22, 1998. Among its tasks was to recommend, within a month, steps that the government must take to remove bottlenecks in the growth of IT, and to formulate a draft national policy on informatics. The Task Force was chaired by Planning Commission Deputy Chairman Jaswant Singh, and co-chaired by Andhra Pradesh Chief Minister N. Chandrababu Naidu and former Union Minister for Science and Technology Prof M.G.K. Menon. National Informatics Centre Director-General Dr. N. Seshagiri, the chief architect of the initiative, was its convenor.

On July 4, 1998, the Task Force came out with its first basic document, IT Action Plan I (ITAP-I). This document identified both impediments in and promotional measures for the growth of IT and made 108 recommendations to make India an IT superpower. This was followed by two other documents. The first, ITAP-II, which was submitted on October 26, 1998, focussed on IT hardware. And ITAP-III, released on April 16, 1999, focussed on a long-term national IT policy. The recommendations were notified in the gazette on July 25, 1998. This seemed to signal a governmental commitment to developing the IT sector.

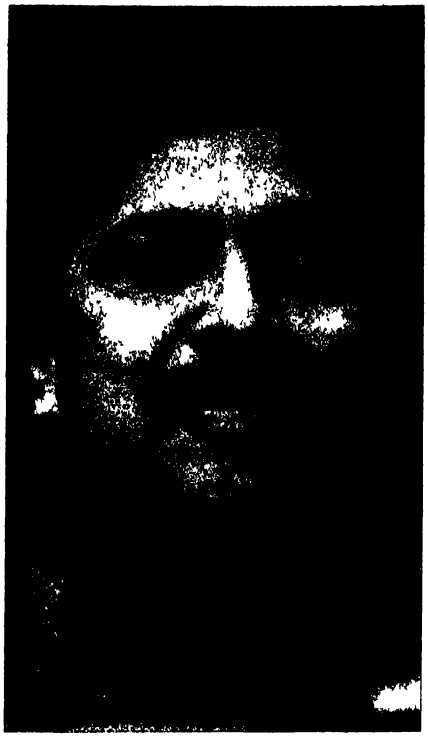
Significantly, these initiatives notwithstanding, a recent report of the United States Department of Commerce's Office of Technology Policy titled "Information Technologies in the Development Strategies of Asia" did not include India among the Asian countries that it studied. The report looked at the Newly Industrialised Economies (NIEs) – Singapore, Malaysia, Thailand, Taiwan and Korea – and China. India figured here only in connection with Singapore's participation in the setting up of an IT Park in Bangalore in 1995, which was expanded in 1997 "specifically to take advantage of India's 140,000 low-cost computer programmers". The objective of the report was to assess the evolution of the new global competitive paradigm and to enable the U.S. to formulate its economic and technological policy and strategies for global cooperation and competition accordingly. Although the report's focus was largely on hardware, its approach would suggest that India, notwithstanding its claimed competitive software capability, was not of strategic importance in the U.S. perspective.

The simple reason for this could be that while India does contribute substantially to meeting the U.S' "new big deficit" in software professionals through manpower export, IT policy instruments that are in place in the country leave much to be desired. The Task Force has completed its tasks, but the political momentum that was evident initially seems to have died down. In fact, there has been no political action on ITAP-II and ITAP-III, which were accepted by the government in principle.

THE presidential notification of October 15 on the creation of the Ministry, the allocations of business of the MIT on October 20 and the likelihood of turf battles among the Ministries on which the MIT will have a bearing (evident from the pronouncements by Ministers) have only served to cause confusion and uncertainty.

In effect, the Ministry is nothing but a "renamed" Department of Electronics (DoE) with "an expanded role". The October 15 notification said that the MIT's resposibility would include "promotion of knowledge-based enterprises, ... promotion of the Internet, ... promotion of e-commerce, ... promotion of IT education and IT-based education," the "National Informatics Centre" and the "Electronics and Computer Software Export Promotion Council". The notification is poorly phrased, for the last two are independent institutions, the former under the Planning Commission and the latter under the Commerce Ministry, and not activities like the others, which the Ministry can help promote.

The phrasing of the 'allocations of business', in the notification of October 20, is even worse. It states: "The nomenclature of the Department of Electronics (DoE) stands substituted by the Ministry of Information Technology with immediate effect." The list of items of business of the MIT in the notification retains some items of business of the erstwhile DoE that are meaningless today, given the paradigm changes that have occurred. It incorporates illogical combinations of functions, such as "coordination of requirements relating to electronics processing equipment (computers)", "all matters pertaining to silicon facility", "all matters concerning computer-based information, technology and processing including hardware and software, standardisation of procedures and matters relevant to international bodies such as IFIP, IBI and ICC." In point of fact, the expression "electronics processing equipment" would cover much more than just computers, the phrase "silicon facility" is meaningless, and the last entry makes no sense; in addition, two of the three international bodies mentioned do not exist



any more.

It is clear that someone who knows little about electronics or IT has done a cut-and-paste job after the first notification of October 15 was issued. The entire exercise is indicative of things to come, complete with the bureaucratic baggage that accompanies the creation of a full-fledged Ministry. On DoE stationery the expression "Department of Electronics" has been replaced by "Ministry of Information Technology", and the DoE Web site is now the MIT Web site. These are only indications that the reorganised structure is at work. The officials and scientists are unclear what their new functions are.

The new Secretary, P.V. Jayakrishnan, IAS, who replaced Ravindra Gupta, is still familiarising himself with the Department's activities. There is uncertainty about what the MIT can or cannot do, particularly in the light of the fact that Communications Minister Ram Vilas Paswan and Commerce Minister Murasoli Maran are unwilling to give up their control over policy matters relating to the Internet (which are currently in the domain of the Department of Telecommunications) and e-commerce and software exports.

It is likely that service bureaucrats will play an active role in the Ministry. The DoE was one of the first scientific departments in which an IAS officer replaced a technical person as its Secretary. Bureaucrats will now be waiting to take up positions in the new Ministry. According to observers, the key position of NIC Director-General may become a casualty. Dr. Seshagiri has thus far kept the NIC away from bureaucratic control and for this reason has not endeared himself to some bureaucratic pressure groups. But he is due to retire in seven months.

Informed sources in the DoE say that Dr. Seshagiri, who has the rank of Special Secretary, may have initially favoured the creation of a Ministry in the hope of becoming its Secretary. In the event, however, the bureaucrats got the better of him. Dr.Seshagiri was apparently slighted at the first meeting held after the erstwhile DoE Secretary Ravindra Gupta, IAS, took over as Secretary in the MIT (consequent on the creation of the Ministry). Every officer present introduced himself or herself: Dr.Seshagiri introduced himself as NIC Director-General and Special Secretary to the Government. To this, one officer is reported to have said that there was now only one Secretary to the Ministry and

SHANKER CHAKRAVARTY

Minister for Information Technology Pramod Mahajan.

no Special Secretaries. Indeed, the NIC's status has been reduced to that of an "attached office" of the MIT: Dr. Seshagiri has to report to the Secretary, and administrative matters regarding the NIC are being handled by a Joint Secretary of the MIT. Such dilution of the NIC's autonomy could prove counterproductive to the development of the IT sector, feel observers.

THE appointment of Pramod Mahajan as Minister for Information Technology is seen as a move to assuage the Bharatiya Janata Party leader who had to give up the Information and Broadcasting Ministry. Mahajan heads another high-profile Ministry – Parliamentary Affairs. Indeed, during his first meeting with MIT officials, he is reported to have said that he was still to familiarise himself with the various aspects of IT and so could not immediately clarify the functions of the Ministry. More significantly, he is reported to have said that many important pieces of legislation were to be come up during the winter session of Parliament, and his responsibilities as Parliamentary Affairs Minister would preclude him from devoting time to his new portfolio for a couple of months.

Mahajan's remark in Mumbai subsequently that the MIT would only be a facilitator and not a regulator has been welcomed guardedly by Dr. Seshagiri, because this aspect is in tune with the Task Force recommendations. However, some of Mahajan's other utterances have confused matters. Just what he meant when he said that the MIT is a "no-budget Ministry" and that IT could have been part of other Ministries such as I&B or Communications is not clear. Since the organisational structure – for example, the relationship and role of the NIC (which has more technical staff than the DoE) *vis-a-vis* the rest of the Ministry – is vague and both the Minister and the Secretary are still "familiarising themselves", even routine business, such as licensing or leasing of bandwidth capacity to Internet Service Providers (ISPs), might come to a halt, feel insiders. Will new applicants have to route their applications through the MIT? Similarly, once the proposed "cyber law", which is to be introduced during the winter session, is passed, which will be the implementing agency – the MIT or the Commerce Ministry (since many of the provisions of the the proposed bill relate to e-commerce) or the Communications Ministry (since the law has also to do with data security, encryption and so on)?

Apart from these issues, the fundamental question of whether there is any need for an administrative structure of a full-fledged Ministry has not been answered. Technologies in respect of computers, communication and broadcasting are converging at a rapid pace. With digital technologies being the cornerstone of virtually every conceivable activity, the component of software, namely, processing of digital information, in equipment is increasing and plain hardware is becoming less functional.

With the increasing penetration of computers in every area, the day-to-day functioning of organisations, public or private, has become IT-oriented. Because of this, the interaction of the public with the government too has become IT-based, be it in banking and other financial transactions, public transport or bill payments. E-governance is the buzzword today (*Frontline*, December 10). The need for an administrative body within the government that coordinates the IT-component in all sectors and promotes increased use of IT, which translates into greater efficiency of operations, is being increasingly felt. But is a Ministry the best administrative structure that can achieve this?

INFORMED sources in the industry concede that there is a need for a catalytic agent or an enabling body to promote IT growth, but feel that a Ministry would only add another bureaucratic layer to the already cumbersome process of securing approvals. They claim that the DoE was more a hindrance than a favourable agent for the growth of electronics. If anything, they say, it was restrictive policies that killed the computer hardware industry. They are not entirely convinced by Mahajan's remark that the MIT would not "regulate" the industry; in their view, a bureaucratic hierarchy will imply greater regulation and more paperwork. If IT is to grow, the government should keep out of it, they feel.

In the perspective of people engaged in electronics R&D and industry, the field involves much more than R&D. The mere fact that there is embedded software in every piece of electronic equipment does not make it IT, they say. For example, how can one justify calling High Voltage Direct Current (HVDC), a major field under the DoE that uses power electronic devices called thyristors, constitute IT and come under MIT? Or for that matter, how can the entire field of radar development or strategic electronics or microwave research under SAMEER, an important activity of DoE, be regarded as IT? Or Standards, Testing and Quality Control (STQC) activity of DoE? In fact, there is a whole range of conventional electronics hardware in the country that is under threat of being wiped out in the wake of impending duty reductions consequent on the Information Technology Agreement (ITA) arrived at under the World Trade Organisation regime. The consequence, they fear, would be a marginalisation and eventual closure of these important activities.

SCIENTISTS at the National Centre for Software Technology (NCST), an R&D centre under the DoE (now under the MIT) in Mumbai, feel that some facilitating body that would support IT R&D was certainly necessary, because IT was not considered part of the Department of Science and Technology (DST) and the DoE had never actively supported R&D in IT. For India to be a dominant player, research and IT education should have been given importance.

The reports of the Task Force too have taken a very narrow vision of IT growth in the country. They have looked at an unrealistic linear model, chiefly from the perspective of growth in earnings from IT services and body shopping, a euphemism for software capability, whereas the ultimate strength in software would come from software packages and application software where there is a dearth of expertise. So, the scientists say, it would be good if some agency – whether it is a Ministry or some other structure – facilitated funding of research and education in IT. But if it is supposed to be a "no-budget Ministry" or a merely renamed structure, it will get nowhere, they say.

The members of the Task Force did not in fact recommend a ministerial structure. The original notification from the Prime Minister's Office that constituted the Task Force said: "The task force will recommend an appropriate empowered institutional mechanism to implement the national informatics policy as a national mission with the participation of the Central and State governments, industry, academic institutions, and the society at large." Accordingly, given the convergence of technologies and information based functionalities, ITAP-III recommended an organisational structure in order to facilitate the coherence in planning and implementation of IT-related activities.

THE organisational structure envisaged by the Task Force included a key adviser on IT in the PMO in order to give proper emphasis and focus to this area and a separate division in the Planning Commission with an IT adviser. At the level of each department and Ministry, it recommended that there be a Chief Informatics Officer with the responsibility to design, develop and implement information processing and retrieval systems. These were to be supported by a High Level Apex Committee on IT comprising national and international IT experts and "enablers" who would assist in the process of defining and implementing the IT vision. "This structure," the Task Force said, "will be insulated from changes at the political level and also will have the credibility and authority to see the process of planning and implementation to its logical conclusion." Clearly, the Task Force did not have a Ministry on its mind.

A senior scientist at the NIC said: "One hopes that this is a temporary phase. You cannot expect entrenched structures to give results. New nucleating centres that emerge have to be separated from these. The Government should have no role besides focussing on convergence and facilitation."

According to the scientists, instead of creating a Ministry, one of three options could have been considered: 1. establishing an empowered development council; 2. establishing a Commission such as the Commissions on electronics, telecommunication or space but without a department; and 3. a notification that IT industry be decontrolled, deregulated and open-ended. He also felt that the DST should be responsible for R&D in IT and that in order to minimise R&D investment in the government sector it should ensure that R&D efforts are not duplicated. "It should only serve to create an R&D platform of national factor advantage, from which industry can take off," he said.

Prof. M.G.K. Menon said that IT was "all-pervasive, and a colonial structure like a Ministry is hardly suited" to facilitate IT growth. "Merely renaming the DoE a Ministry with a few appendages "cannot work and this is not what we recommended," he added. "A suitable enabling structure has to be evolved. Our experience with Commissions suggests that even a Commission may not be the correct structure. We have to look at new forms of structures that bring together the IT component in all sectors, including education, health and agriculture. But the government has shown little interest in our reports after the first one was submitted. The other reports have not seen the light of day."

In the opinion of Dr. Ashok Parthsarathi, who was among the first to bring to the government's attention the need for an IT policy, the Planning Commission "has all the necessary structure and authority to fund, focus and implement IT-related strategies which cut across Ministries and regions." He had advocated a structure for India along the lines of the Chinese model which, he feels, is eminently workable for India.

As it stands, the MIT is quite different from what people at various levels feel is the most appropriate administrative structure; the new Ministry has created a climate of uncertainty in respect of IT growth in the country as the world enters a new millennium which will be knowledge- and information-driven. The creation of the Ministry seems to be conceptually flawed. Under these circumstances, will the dream of India as an IT superpower ever become real? ■

A century of service

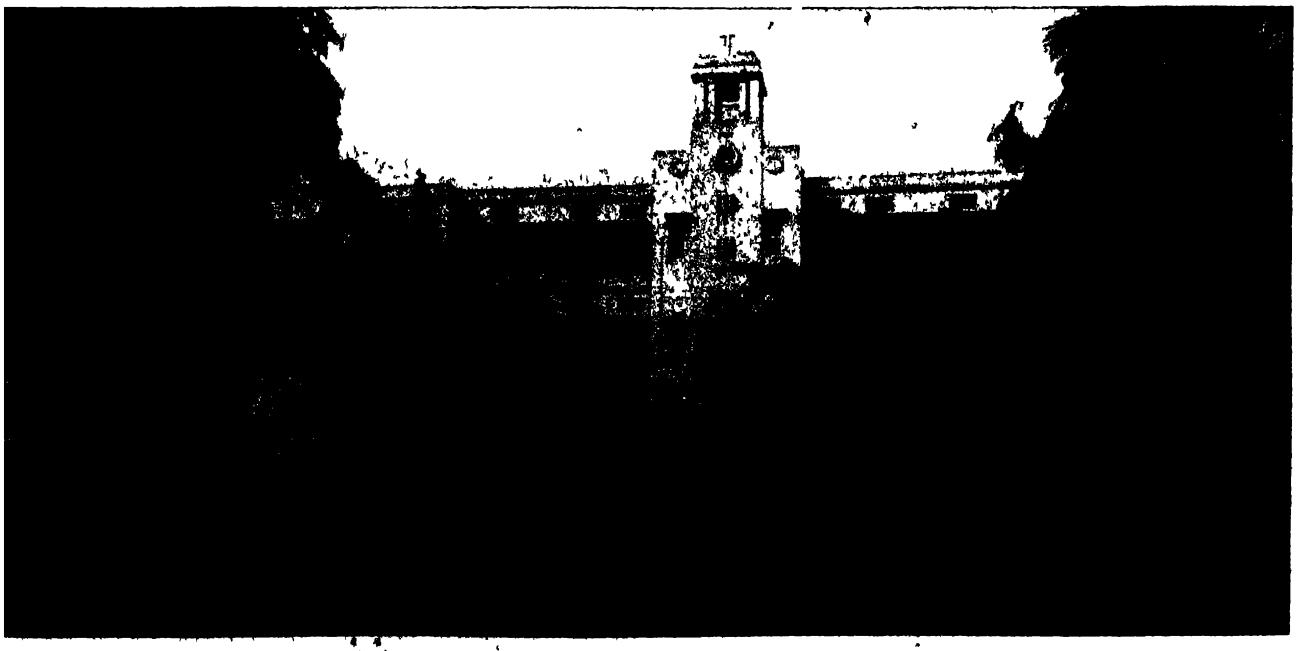
The year-long centenary celebrations of the Christian Medical College and Hospital, Vellore, begin on December 9.

ISHA KRISHNAKUMAR
n Vellore

WHEN on January 1, 1900, Dr. Ida Sophia Scudder converted her modest house in Vellore, in the then Madras Province, into a one-bed clinic, she would have scarcely imagined that it would grow into a 2,000-bed hospital – the Christian Medical College and Hospital, or CMC Vellore. At present the hospital has 55 clinical departments and treats one lakh inpatients and 12 lakh out-patients a year. CMC's year-long centenary celebrations begin on December 9, the day Ida Scudder was born.

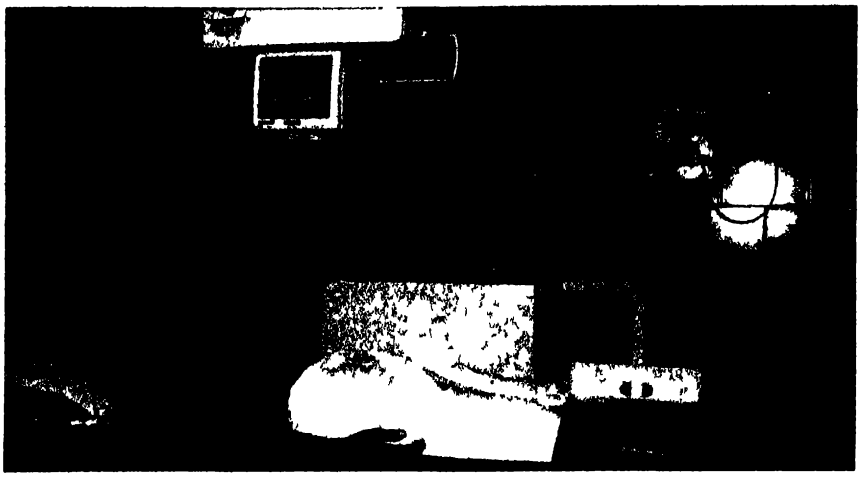
One of the first women to be trained t the Cornell Medical School in the Jnited States, Ida returned to Vellore – here her father had spent a lifetime – to rovide medical care to women who, ecause of religious and social taboos, ould not get treated by male doctors. In er zeal to reach medicare to remote vilges and to reluctant patients, Ida cudder set up "roadside clinics", by carring medicines to villages in a bullock art. Thanks to a donation, she built the 40-bed Mary Taber Schell Memorial Hospital (named after the donor) in 1902, which subsequently became CMC.

Realising the medical needs of the women of the area and her own inability to serve all of them, Ida Scudder began training compounders in 1903, and set up a school of nursing in 1909. Her dream of establishing a medical school for women, which trained licentiates, materialised in 1918. The medical school became a medical college in 1942, and it began admitting male students in 1947. To provide medical aid to the rural poor, the Community Health and Development (CHAD) unit, with 80 beds, was started in 1955 and the Rural Unit for Health and Social Affairs (RUHSA), with 40 beds in 1977. A 40-bed low-cost effective care unit was opened for the urban poor in 1983.



The medical and teaching facilities at CMC grew with the addition of various specialities from time to time, most of them pioneering efforts. Today, CMC offers 90 recognised training programmes in medical, nursing and allied specialisations.

CMC is run by the Vellore Christian Medical College Association, a registered charitable society with the involvement of over 50 Indian Protestant churches and other Christian organisations. It is administered by a governing council consisting of representatives of the Association and of some 30 other organisations based in India and abroad.



CMC's work is broadly divided into four areas: patient care, teaching, out-reach and research. All faculty members are expected to contribute to each of the four areas. All the 620 doctors, 182 members of the teaching staff, 1,314 nurses and students stay on the four campuses.

Although the pay structure is low in CMC compared to other institutions, the doctors have continued to work. This, according to CMC Hospital Medical Superintendent Dr. George Chandy, is because "they derive tremendous job satisfaction as they can teach, treat, carry on research and participate in out-reach programmes."

In the heart of Vellore town is the 27-

MC Vellore. Excelling in patient care, teaching, outreach and research.

At the magnetic resonance imaging facility.

acre (10.8-hectare) main hospital campus, which also houses the College of Nursing and the residences of some essential clinical staff. Close by is another campus, where Ida Scudder set up her 40-bed hospital; it houses the Schell Eye Hospital and the Ida Scudder ward, which provides free medical treatment for the urban poor. The 106-acre college campus at Bagayam, 7 km from the town, accommodates the hostels of students and the quarters of the staff of the college. It also houses the base hospital for CHAD, the Mental Health Centre and the Rehabilitation Institute. The RUHSA Hospital is at K.V. Kuppam, 30 km from the town. The main hospital has 16 operation theatres where over 45 major surgical operations are performed every day.

CMC has several firsts to its credit: it performed the first successful open-heart surgery in India (1948), the first reconstructive surgery for leprosy patients in the world (1948), the country's first middle-ear microsurgery for deafness (1961), the first kidney transplant in India (1971), the first gastrointestinal endoscopy (1972), the first carotid bifurcation stenting in India (1996), the first transeptal carotid stenting in the world (1996), and the first transjugular mitral valvuloplasty in the world (1996). Its other achievements include the setting up of the first neurological sciences department in South Asia (1948) and the first rehabilitation institute (1966), and the first virology department (1978) in the country.

CMC reaches health care to the poor while keeping abreast of technology. It is one of the best-equipped hospitals in the country. According to the hospital's director Dr. Joyce Ponnaiya, "the hospital acquires only need-based equipment and the facilities available are comparable to those used in any major hospital in the country." About 400 open-heart surgical procedures, 100 kidney transplants, 40 bone marrow transplants and 900 angiocardiograms and cardiac catheterisations are among a variety of diagnoses and treatment performed every year in the hospital.

About 77 per cent of the beds in the main hospital are in the general ward, where treatment is subsidised. About 15 per cent of the patients here are treated free of cost. In 1998, the underwritten medical costs of the poor were Rs.11.8 crores. The recurring costs for 1998-99 were Rs.84.5 crores. In addition, CMC spent a total of Rs.4.64 crores on research activities and scholarships for poor students.

K. PICHUMANI

Handicapped children at Nambikkai Nilayam, which was set up in 1978 to train mentally challenged children and their parents.

The cost of treatment ranges from rates comparable to those charged by corporate hospitals, to practically nothing, depending on the economic status of the patients. However, according to Dr. Chandy, "there is no difference between the treatment given to patients who pay and to those who are not charged a fee."

THE specialised departments of CMC do not operate as profit centres; they cross-subsidise each other. Each department has set high standards for itself.

The Developmental Paediatrics Unit, headed by Dr. M.C. Mathew, focusses on identifying the neuro-developmental needs of children and helping them develop learning skills. It trains doctors and health workers in early childhood development and undertakes research work. It is the only department in any medical college in the country that trains doctors in this area.

The Rehabilitation Department, set up in 1966 by Dr. Mary Verghese, a student of CMC who became a paraplegic after an accident, initially rehabilitated victims with spinal cord injuries. By the early 1970s, it began providing trauma care and treated cases of tuberculosis, cancer, diabetes, cerebral palsy and viral infection of the central nervous system (CNS).

It is a comprehensive facility providing physiotherapy and vocational and occupational therapy. The department collaborates in research with experts from the fields of bio-medical engineering and electronics and professionals from institution, such as Indian Institute of Technology's (Chennai) Composite Structures Department. Its workshop, one of the oldest in the country, has designed and developed low-cost aids such as calipers, wheel-chairs and special shoes with locally available materials. Its staff include rehabilitated patients. The unit also runs an out-reach vocational rehabilitation programme in a 100-km radius around the hospital.

Dr. Jacob John of the Virology Department was the first to detect an HIV (human immunodeficiency virus) positive patient in the country – in 1986. The department's activities include conventional cell-culture-based virus identification, antibody tests and antigen detection, molecular diagnostics of eight

viruses and the study of opportunistic viral infections, HIV and hepatitis. Identified as a referral centre for HIV patients, the unit, headed by Dr. G. Sridharan, works in association with the National AIDS Control Organisation.

The Cardiology Department, started in 1955, has done pioneering work. In 1997, it developed a balloon, which costs Rs.16,000 and can be used up to 20 times to correct the narrowing of the mitral valve. (Rheumatic fever narrows the mitral valve, thereby blocking blood flow. Earlier balloons from Japan, each costing Rs.75,000, were used to clear the block. These were not reusable.) CMC has done over 600 procedures using this balloon.

This department was the first in India to treat aneurysms without surgery. The department, under Dr. V. Jacob Jose and Dr. George Joseph, also treats children – even babies – with congenital heart diseases.

The Reproductive Medicine Department, set up in 1995, employs state-of-the-art techniques – blastocyst transfer and assisted hatching and procedures such as in-vitro fertilisation (IVF), gamete intra-fallopian transfer (GIFT) and intra-cytoplasmic sperm injection (ICSI) to treat male and female infertility. CMC does not accept donor sperms or eggs for fertilisation.

Started in 1986 to treat blood disorders, the Haematology Department has carried out 216 bone marrow transplants, including 102 bone marrow transplants in patients with thalassemia (for a genetic disorder in which adequate haemoglobin is not produced), the hightest number in each case in the country. It recently did a transplant on a six-month-old baby with Wiscott-Aldrich Syndrome, an immune deficiency disorder.

The department, headed by Dr. Mammen Chandy, also treats aplastic anaemia (bone marrow failure); haemophilia (a bleeding disorder); and leukaemia. It also performs peripheral stem cell transplants.

CMC was the first college to start a super-speciality training course in blood diseases. Among its major research work is a study on Glanzmann's disease, a bleeding disorder, common among communities with consanguineous marriages.

Apart from routine procedures and treatment, the ENT Department, headed by Dr. Anand Job, does functional endoscopic sinus surgery pertaining to nasal polyps and sinusitis. The department recently acquired a micro debrider, which is used to remove the polyps and bones, with minimum bleeding.

The department treats patients with vertigo and snoring problems, and reconstructs the ear. It was one of the first in the country to remove laryngeal tumours without loss of the voice box.

Set up in 1902, the Department of Surgery, the oldest in the country, was upgraded to a post-graduate training department in 1950. The department, now headed by Dr. Bannerji Jesudason, is one of the best in terms of manpower and technology. It performed a liver transplant recently.

The Department of Urology does 100 renal transplants a year and has started doing nephrectomies laparoscopically.

Started in 1948, the Neurology/Neurosurgery Department was the first such in the country. In 1952, it started performing surgical operations on epileptic patients. The department, headed by Dr. Chandran Gnanamuthu, has pioneered several techniques and is the only facility doing intra-operative brain monitoring in the country.

THE Mental Health Centre was started in the early 1950s. Its unique aspect is that it insists on the members of family staying with the patients on the campus, which has a number of small dwelling units – 20 private and 40 general units and 12 dormitories.

The centre has 90 beds and caters to all age-groups. It has several facilities - child and adult psychiatry units, a learning disability centre, a school for the mentally challenged children and therapy centres for various age groups.

A missionary, after all

ASHA KRISHNAKUMAR

IN 1889, 16-year-old Ida Sophia Scudder, who had just finished school, set out from Boston in the United States to Vellore to nurse her ailing mother. Her father, a doctor, had been with her mother for more than 10 years. He was engaged in missionary work. Ida had long decided that she would not take up missionary work. She planned to return to the U.S. as soon as her mother recovered.

Ida's resolve broke one night when three men sought her help. Their wives were in labour and the local local mid-wives were unable to help in the "complicated cases". Social and religious taboos prevented them from seeking her father's help. The women died that night, and this affected Ida deeply. She realised how badly the women of Vellore needed a woman doctor.

Ida went back to the U.S. in 1890 to study medicine. She was one of the first women to be admitted to the Cornell Medical School. After her final examinations, she was told by the Dutch Reformed Church to raise $8,000 to set up a clinic for women in Vellore – a job that was easier said than done.

A frustrated Ida had almost given up her plan to set up a clinic in Vellore when a friend suggested that she approach Miss Taber, who lived a few blocks away for help. The next day Ida went to Miss Taber's house where she met Schell, Taber's brother-in-law. Ida explained to Taber the miserable condition of women in India and how badly they needed a hospital.

The next day Schell sent her a note expressing his wish to meet her. When an anxious Ida met him that afternoon, Schell asked her if she was capable of running a clinic all by herself. To this, Ida merely asked him to check her credentials. Schell, who had already done that, handed her a cheque for $10,000 and asked her to name the hospital after Mary Taber Schell, his late wife.

Ida returned to Vellore in 1900, and within two years converted her father's house into the 40-bed Mary Taber Schell Hospital. It now houses the CMC's Eye Hospital.

Until her death in 1960, Ida spent her life for the women and children of Vellore and its surrounding areas. She helped whoever came to CMC seeking medical assistance. ■

The department, under Dr. Pratap Tharayan, also counsels AIDS (Acquired Immune Deficiency Syndrome) patients. It has been funded by the National AIDS Control Organisation, the AIDS Prevention and Control Project (APAC) based at the Voluntary Health Services Hospital, Chennai, and the Ford Foundation to train counsellors More than 1,000 people have been trained until now It also conducts programmes aimed at commercial sex workers, looks after the children whose parents have succumbed to AIDS, and networks with non-governmental organisations in the country.

CMC offers 90 recognised training programmes in medical, nursing and allied specialisations. It prefers to admit students who are willing to work in rural areas.

The department set up in 1978 the Nambikkai Nilayam (house of trust) to train mentally retarded children and their parents. This is also a residential training centre concentrating on behavioural therapy and coping mechanisms for children and is headed by Dr. Paul R. The centre accommodates up to 60 children and there is usually a waiting time of one year. The unit has also set up a self-help group of parents which works outside the hospital but with its active involvement

Other departments include the Department of Nuclear Medicine, Radiation Oncology, Gastroenterology, Endocrinology, Hepatology and Nephrology.

CHAD was set up as a pioneering hospital-based socio-economic programme. Known for its innovative approach, CHAD bagged the World Health Organisation's (WHO) "Best programme in South Asia" award in 1998 for providing primary and secondary health care to the rural poor.

The focus of CHAD's activities is the villages. CHAD has a base hospital at Bagayam with 80 beds. On an average 50,000 out-patients and 6,000 in-patients are treated there every year. The hospital has a high-risk obstetrics clinic, a nutrition rehabilitation centre, a leprosy care unit, an operation theatre, a laboratory, a pharmacy and a communication and monitoring department.

CHAD does yeoman service through its health teams operating in 68 villages of Kaniyambadi block, covering a population of 100,000. The programme has achieved 100 per cent immunisation in these villages: infant mortality, malnutrition and perinatal mortality have been brought down significantly

CHAD also offers technical support and advice in animal husbandry and agriculture. It runs 26 balwadis, or day-care centres for children under five, and has set up a Community Development Society (CODES) to help women take up income-generating activity. There are also centres such as SHARE (Self-help Association for Rural Education and Employment) which, after being under CODES for several years, are now on their own. SHARE has an annual turnover of Rs.35 lakhs.

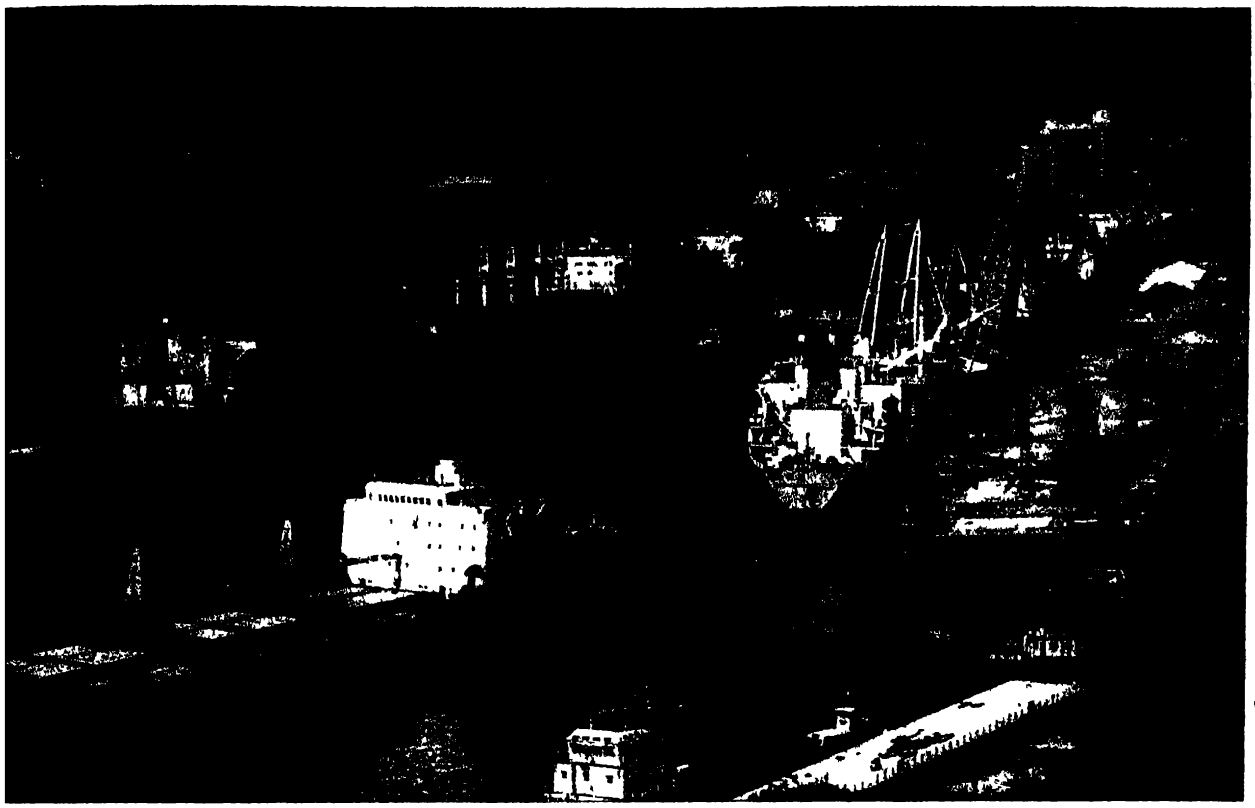
The RUHSA programme covers 39 panchayats of the K.V. Kuppam block with a population of 120,000. It concentrates on improving social, economic and educational conditions, and has organised 118 women's self-help groups

CMC's research activity has become integral to its other services. For instance, in 1998, 29 projects were sponsored by the Department of Biotechnology of the Government of India, the Indian Council for Medical Research (ICMR), the Council for Scientific and Industrial Research (CSIR), the Wellcome Trust and the Community Based Rehabilitation Forum. Fluid research grants from CMC, amounting to Rs.15 lakhs, were sanctioned for 81 new projects; besides, such grants support 144 ongoing projects.

The treatment of over two crore out-patients and 12 lakh in-patients in the last 100 years has generated an enormous quantity of data, which are stored since 1989 in the Computerised Hospital Information Processing System (CHIPS). Now any information – from details about out-patients to laboratory test results and surgical procedures – is readily accessible. Records of in-patients are maintained for 25 years and those of out-patients for five years.

CMC has undertaken a number of epidemiological research projects. It has conducted studies on the patterns of Hepatitis C, HIV and AIDS, gastrointestinal and diarrhoeal disorders, rehabilitation methods, leukaemia and metabolic disorders, and on bone marrow transplants.

An important part of the curriculum of the medical college is community medicine, which entails staying in a village for several weeks each year. After graduation, those students who have gained admission on the basis of sponsorship by chruches, serve for at least two years in hospitals run by the sponsor.



The college, which has an impressive infrastructure, admits 60 students, at least 25 of them women, at the undergraduate level. Churches sponsor 45 students. Preference is given to students who are willing to return to the rural areas, poor students (who comprise 15 of the sponsored ones), and students belonging to the backward classes. The students are required to serve in India at least for four years.

Dr. George Mathew, vice-principal of the college, said: "The fees at CMC is the lowest in the country. We charge Rs.3,000 for a year for the undergraduation course. Scholarships are available for students who cannot afford the fee. The hospital subsidises the college activity."

The college offers 24 post-graduate courses (90 students are admitted every year), 12 superspecialities, and a large number of para-medical training courses such as laboratory technician and nursing coruses.

Dr. George Mathew said that most of the students joined the hospital after completing their graduation. Even students who went elsewhere for advanced training courses returned to CMC.

Ida Scudder died in 1960 at the age of 90, but the spirit with which she set up CMC is not dead. It will continue to serve the community just as well in the new millennium. ■

P V SIVAKUMAR

At the Visakhapatnam Port Trust, emerging as a major trans-shipment and distribution centre.

A preferred destination

Visakhapatnam district emerges as an industrial hub, promising efficient and easy trans-shipment and distribution facilities among other advantages.

B. PRABHAKARA SARMA
in Visakhapatnam

VISAKHAPATNAM for long has been recognised as a preferred city for potential industrial development in Andhra Pradesh. Today more and more private and public sector industries are looking forward to new policy measures from the N. Chandrababu Naidu Government that would help them find their moorings in the port city and its promising hinterland.

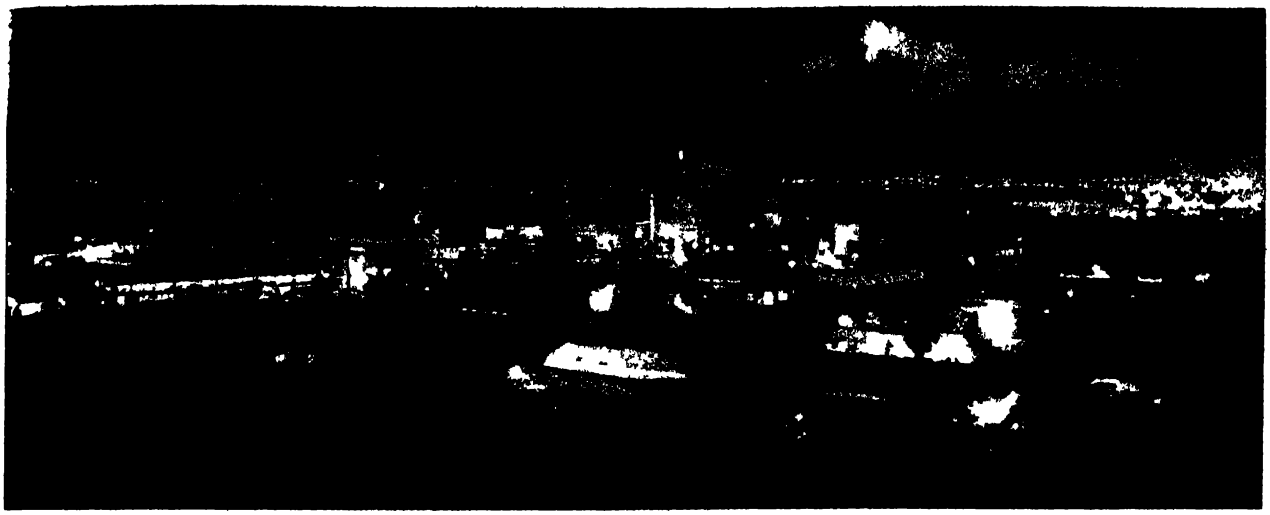
The Visakhapatnam Steel Plant (VSP), has been doing well in many respects but has been in the red owing to the interest burden on loans taken during the project implementation stage. A bail-out package worked out for the VSP now looks certain to be cleared by the Centre. This one-time package will set off losses to the tune of nearly Rs.3,100 crores against the capital base. The waiver may enable the plant to start on a clean slate, avoiding an intervention by the Board for Industrial and Financial Reconstruction (BIFR).

A capital restructuring plan has been approved for the public sector Hindustan Shipyard Limited (HSL), the premier ship-building company, which, true to the international trend, is short of orders. HSL is as yet unable to overcome its financial difficulties; the company, which has built 111 vessels since 1948, now relies on ship repair works for its sustenance. The capital restructuring proposal includes writing off government loans, interest and guarantee fee adding up to Rs.470.93 crores, and conversion to equity of government loans of Rs.120.20 crores. The impact of the capital restructuring process would be reflected in the company's books only after HSL receives approval for the exemption of the minimum alternative tax (MAT), Rear Admiral R.N. Bhatia, HSL Chairman, said. The company has been asked to pay Rs.36 crores under MAT.

The industrial growth of Visakhapatnam is reflected in the presence of major public sector undertakings such as the VSP, HSL, Bharat Heavy Plate and Vessels, the Dredging Corporation of India, the zinc-lead smelter of Hindustan Zinc Limited and the Visakh Refinery of Hindustan Petroleum Corporation Limited (VPCL). In the private sector the Essar Pelletisation Plant and Coramandel Fertilisers Ltd, are leaders in their respective fields.

The State Government is keen to develop infrastructure, particularly in the port sector. The natural harbour of Visakhapatnam meets the import and export needs of the major players in and around the north coastal Andhra region. The Kakinada port has been handed over

Zinc is everywhere



Be it Culture or Agriculture, zinc has a role to play. The strings of musical instruments which produce sound when vibrated, the sound of the anklet, make-up material used by the dancers, all remind us of zinc. The fertilizers with zinc content, help the farmers for higher yield of foods to feed the world. Zinc is also essential for human body, for galvanizing steel, die-castings, alloys, paints & pigments, cosmetics, pharmaceuticals.....

HINDUSTAN ZINC LIMITED

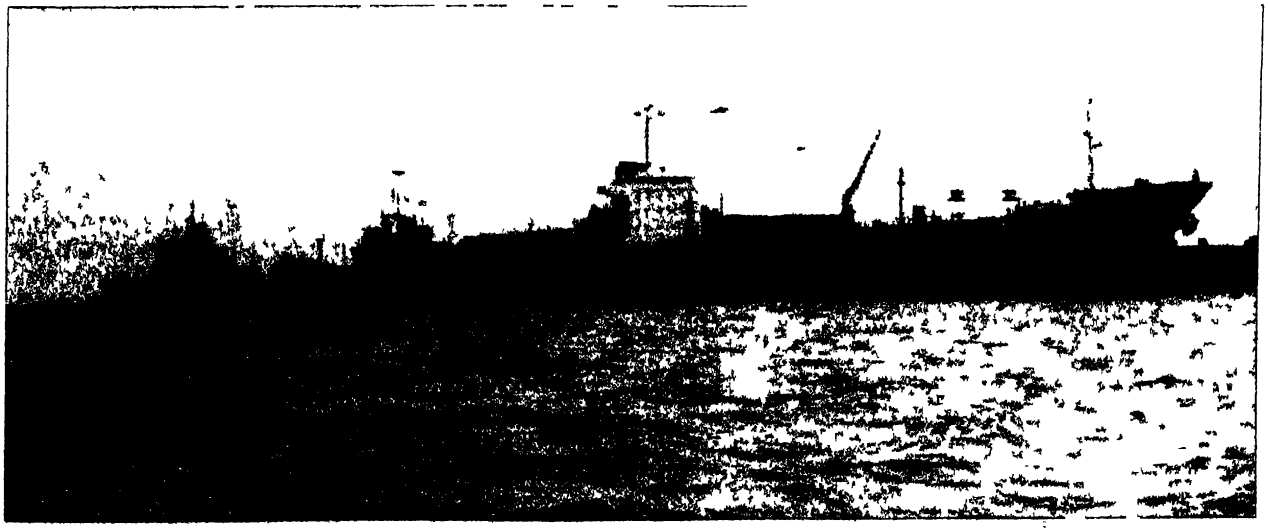
to Cocanada Port Company Private Limited (CPC), a member-company of the International Sea Ports Private Limited

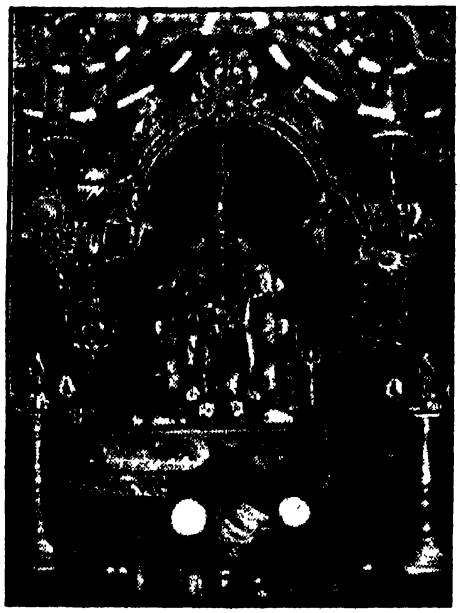


According to Brian L Black, chief executive, in addition to the existing berths, CPC will in the next two decades, develop three berths The Kakinada Deep Water Port (KDWP) has a 120-acre back up area He said that the port has vast potential to handle a variety of cargo This is an advantageous factor for the Godavari region, which is developing industrially The total area of the three-berth deep water port is 2,698 acres, of which 943 acres is the water spread About the immediate plans of the port, he said that dredging operations to a depth of 12 metres are being undertaken The first coal-laden ship is expected to berth in January 2000 after the operations are completed

With the Visakhapatnam-Kakinada industrial corridor taking shape, the port, with the natural advantage of its location on the Coromandel coast, is bound to attract more cargo Five international firms have bid for using this port for container operations On an average 300 containers can be handled here every month

Leaf tobacco, ceramic tiles and seafood are the main export commodities, while coal, liquid ammonia, naphtha and waste paper are the items of import that are expected to be handled on a large scale by the port Barytes from the mines of Khammam district will be a new export commodity the port will handle in the coming months This cargo is at present routed through Visakhapatnam or Chennai ports after transportation by rail Brian L Black said that "the emergence of a deep-water port offers a cost-effective method of reducing the land transit distance "

A further boost to the port sector would be the starting of a port at Gangavaram, in the backyard, so to say, of the steel plant This is expected to be financed by the State and Central governments



The Visakhapatnam Port Trust (VPT) topped the major ports in the country in cargo handling, earning the distinction of the trade s preferred port" While the privatisation of the proposed four multi-purpose berths has been delayed the expansion programme is progressing briskly on other fronts with three new berths scheduled to be commissioned next year According to S R Rao, VPT chairman, the first multi-purpose berth will be commissioned in March The new berth is likely to be converted into a full-

At the deep water port of Kakinada, under new management, bound to attract more cargo in the coming phase.

SRI VEERA VENKATA SATYANARAYANA SWAMY DEVASTHANAM

ANNAVARAM, EAST GODAVARI DT. ANDHRA PRADESH.

Sri Veera Venkata Satyanarayana Swamy Devasthanam is a very famous shrine located on the hill RATNAGIRI on the banks of river Pampa, Annavaram village East Godavri Dist. Andhra Pradesh. Devasthanam offers the following Saswatha Pujas & Sevas to the Devotees.

1. **SASWATHA KAINKARYAMS**

a. **Saswatha Annadanam Scheme** : Annadanam would be provided to 15 persons on any selected date of the year by the devotee for Rs.1000/-.

b. **Saswatha Free Prasadam Scheme** : Free prasadam would be distributed at the temple on any selected day of the year by the devotee (for Rs.1116.00 - 3 kg prasadam).

c. **Saswatha Kalyanam** on any selected day of the year by the devotee for Rs.10,000/- or Rs.5,000/-.

d. **Swamy Vari Visistta Vratham** on any selected day Rs.1,116/-.

e. **Swamy Vari Spl Saswatha Vratham** on any selected day of the year by the devotee Rs.700/-.

f. **Swamy Vari Saswatha Vratham** on any selected day of the year by the devotee Rs.500/-.

g. **Swamy Vari Saswatha Puja** on any selected day of the year by the devotee Rs.250/-.

h. **Saswatha Nitya Sahasra Namarchana** for Rs.25,000/-.

SEVAS

Silver Palinde Seva for Rs.750/- (every monday).

Silver Chariot (ratham) for Rs.1,116/- (on ekadasi & poornima day)

Advance reservation for above sevas accepted. Mail your remittance by DD on any nationalised bank with the Name, Gothram, Date of performance to the under signed.

COTTAGE DONATION SCHEME :

Philanthropic devotee donors are invited for donations under this scheme. Site for construction of independent cottages and rooms in choultries available. The donors will be alloted accommodation immediately for 45 days in a calender year.

1. Centenary Cottage	-	Rs. 1,00,000/-.	2. Satya Niketan Choultry	-	Rs. 55,000/-.
3. Satya Deva Guest House	-	Rs. 46,200/-.	4.Sri Sitarama Choultry	-	Rs. 21,500/-.

NITYA ANNADANAM SCHEME

Contribution for Saswatha Annadanam Pathakam are solicited from devotees.

This scheme started from 1-1-89 and till now pooled an amount of Rs.3.50 crores. The interest from the same is used for providing Annadanam to 2500 needy devotees. To increase the Annadanam to the number of devotees to 5000, Devasthanam invites donations for this scheme.

The Devotees can contribute under the following categories.

★ **MAHARAJA POSHAKULU**	Rs. 1,00,00/- & above donations.
★ **RAJA POSHAKULU**	Rs. 50,000/- "
★ **POSHAKULU**	Rs. 10,000/- "
★ **DATHALU**	Rs. 2,000/- "
	Rs. 1,000/- "

For a contribution of Rs.1,000/- Annadanam would be provided to 15 persns on any selected day of the year by the devotee.

By contributing Rs. 25,000/- Annadanam would be provided every day to one person.

Contributions by the devotees are eligible for INCOME-TAX REBATE UNDER SECTION 80(G).

Donations may be sent by demand draft in the name of Executive Officer, Sree Veera Venkata Satyanarayana Swamy Devastanam, Annavaram on any Nationalised Bank.

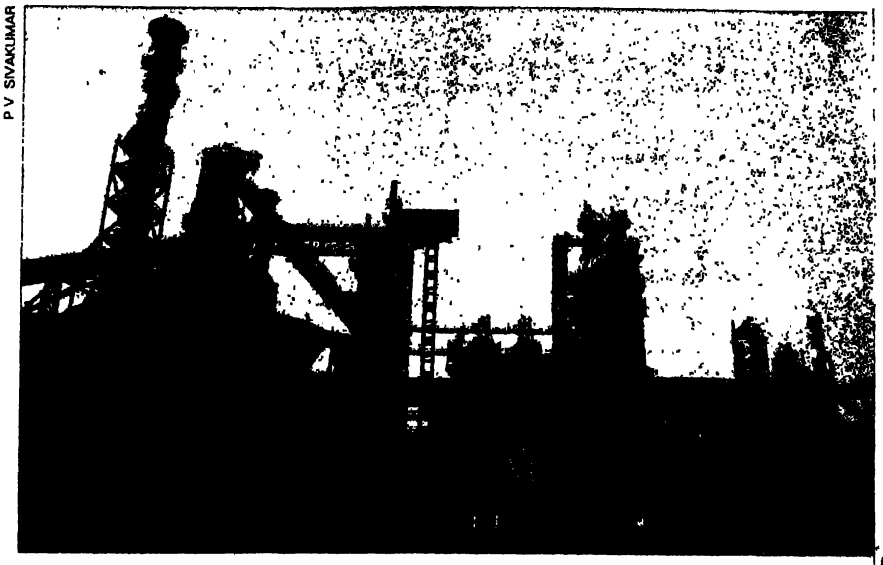
Executive Officer,
Regional Jt. Commissioner

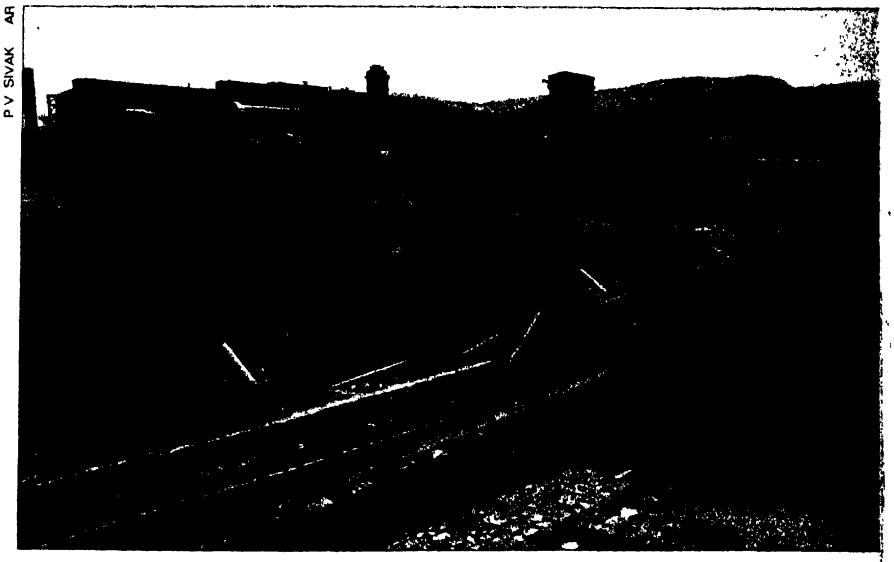
fledged container terminal with the installation of container handling equipment and container quay cranes with private participation.



The liquefied petroleum gas (LPG) jetty, complete with modern fire-fighting equipment, in the outer harbour will be ready by the end of March. This is expected to give a boost to LPG traffic through the port, particularly with the Visakh Refinery going ahead with its expansion programme. The VPT lags only in the construction of the four multi-purpose berths – two of them under a build, operate and transfer (BOT) scheme and two as captive berths for private users – in the inner harbour. The authorities are now considering taking up the construction of these berths in order to step up business.

In fact, Visakhapatnam is fast emerging as a nodal importation point for the distribution of LPG in south India. Besides the VPT's LPG berth, the city has the first and only private storage facility on the eastern coast in East India Petroleum Limited (EIPL). Another major development is the setting up of India's first underground LPG storage facility. The $50-million LPG cavern, located 145 metres underground, is coming up as a joint venture of HPCL and TotalFina of France. The company was registered in November as South Asia LPG (SALPG). This 60,000 tonne-capacity project is expected to be completed by 2003.

SALPG is discussing with Gas Authority of India Limited (GAIL) the distribution of LPG through pipelines.



The port has also been billed as a promising trans-shipment and distribution centre for fertilizer thanks to the high level of productivity that has induced ship owners to offer concessional freight rates of two or three dollars per tonne when fertilizer ships are nominated to this port.

P V SIVAKUMAR

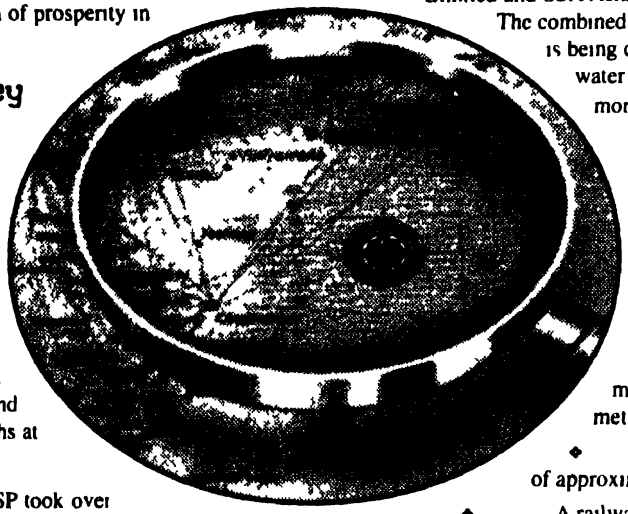
At the Visakhapatnam Steel Plant.

P V SIVAK AR

At the Essar Pelletisation Plant, conveyor belts transporting pellets.

POWER generation also is set to improve with two 1,000 MW units each of the Hinduja National Power Corporation of the United Kingdom and the National Thermal Power Corporation's (NTPC) Simhadri Plant getting ready in Visakhapatnam district. An added feature is that the latter is a fully dedicated plant, with 100 per cent of the power generated being supplied in Andhra Pradesh. A number of small power generation units are also coming up in the region. These will meet the requirements of units located in northern Andhra Pradesh.

Another area poised for further development is the mining sector. Andhra Pradesh has the second largest bauxite reserves in the country after Orissa. But it has recorded zero production. While Orissa accounts for 44 per cent of the total production of aluminium. Bihar has a 22 per cent share, while Gujarat and Maharashtra have 11 per cent each and Madhya Pradesh has 10 per cent. The rest of the production is shared by Tamil Nadu, Goa and Karnataka.



The bauxite reserves are located in Krishna Devi Peta near Narsipatnam in Visakhapatnam district along the Eastern Ghats, which link up with neighbouring Orissa. The bauxite reserves will contribute significantly towards the economic growth of the region, particularly in the area of production of aluminium and certain salts of aluminium. It would aid the growth of other industries such as those involved in refractory bricks, ferric and non-ferric alum, abrasives, high alumina cements, refining of kerosene, paraffin wax and sugar.

One company that has posted all-round growth is Hindustan Zinc Limited. HZL has embarked on an ambitious programme for further growth through expansion, modernisation and greenfield projects with an investment of Rs.2,500 crores in the next five years. The company's performance so far during 1999-2000 indicates yet another "satisfy-

DESTINATION..... KAKINADA

Kakinada Deep Water Port (KDWP) The Rising Force in Eastern India

The fertile and industrial coastline of Andhra Pradesh, now holds the key to a more prosperous and productive future Kakinada, which until now was known only for its lighterage operations, will now rise from the eastern waters to become one of India's foremost Deep Water Ports With state-of-the-art handling systems that are being implemented, Kakinada Deep Water Port is all set to usher in a new era of prosperity in the Coromandel coast

Privatisation - The Key to Prosperity

On the 19th of March, 1999, the Government of Andhra Pradesh opened the doors to privatisation at Kakinada And Cocanada Port Co Pvt Limited, a special purpose company of International Seaports Pte Limited Singapore, was assigned the tremendous task of operating, maintaining, sharing and transferring the existing three berths at Kakinada Port

And since the 1st of April, after ISP took over the deep water port operations, the Kakinada Port has attracted more ships than ever before, handling as many as 23 ships within 30 days

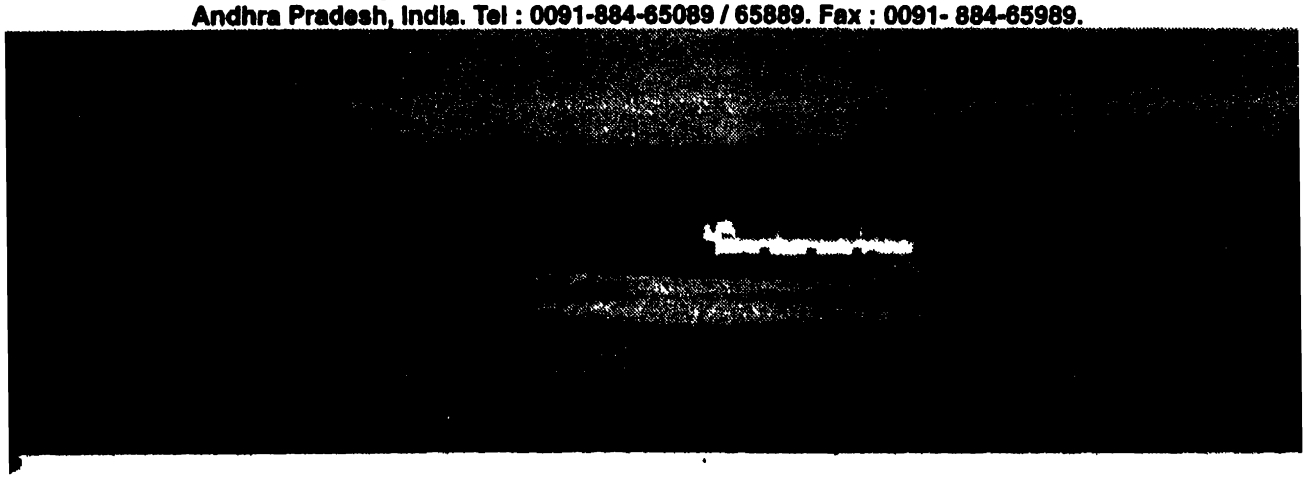
Being a privately operated port Kakinada offers a unique package of specialised services and provides individual attention to all its clients

The private management also ensures faster loading and unloading time And the port now functions with enhanced vitality

International Seaports Pte. Limited The Global Giant

International Seaports Pte Limited is a joint venture between Larsen and Tourbo Limited Precious Shipping Public Co Limited and SSA Asia Inc (A Washington Corporation) The combined expertise of these three companies is being channelised to ensure that the deep water port at Kakinada will be the most mordern port in the country

Key Features of the Deep Water Port



- 610 metres of berth length with a wharf 25 metres wide
- A channel which can allow ships with a draft of 9 5 metres is being deepened to 12 metres
- Partially developed back up area of approximately 120 acres behind the berth
- A railway line, just 3 kms away
- A covered warehouse on the wharf measuring 130 metres x 40 metres
- Piping infrastructure on the wharf to evacuate both edible oils and liquid petro products
- The best security any port can offer

For the tourist, and the pilgrim

G. NARASIMHA RAO
in Visakhapatnam

In Andhra Pradesh, comprising Visakhapatnam, Vizianagaram, Srikakulam and East Godavari districts, enjoys a special place in the history of the State. The region, bounded by the Bay of Bengal in the east, has played a crucial role in the socio-political development of the State right from the pre-Independence days. Reformers and writers from here helped transform society and also change the course of Telugu literature.

In Rajahmundry in East Godavari district, Kandukuri Veeresalingam Pantulu defied existing social norms and was ostracised for propagating social reforms. He continued to fight for the uplift of women through his social organisation, Hitakarini Samaj. Bulusu Sambamurthy gave up a lucrative legal practice in Kakinada in East Godavari district, as also his wealth, to join the freedom movement at the call of Mahatma Gandhi. He led an austere life and died a simple man although he was one of the top Congress leaders of the time.

VISAKHAPATNAM owes its current enviable position with regard to industrial activity to Tenneti Viswanatham, one whose moral stature and integrity could be matched only by Andhra Kesari Tanguturi Prakasam Pantulu. Tenneti dedicated himself to the freedom movement, and later played a role in the development of free India. The Visakhapatnam Steel Plant can be said to owe its existence to Tenneti, whose slogan *Visakha ukku, Andhrula hakku* (Visakha steel is Andhra's right) did not go unheeded.

Visakhapatnam and Vizianagaram witnessed the evolution of radical philosophies that contributed to the enrichment of Telugu literature. Two prominent [illegible] literary luminaries, Sri Sri and Rachakonda Viswanatha Sastry (Ravi Sastry), gave a new direction to Telugu writing. [illegible] of Vizianagaram questioned the orthodox views in his *Kanyasulkam* (Price of the Bride), a hard-hitting satire on the practices of child marriage and suppression of women. Puripanda Appala Swamy and Chaganti Somayajulu (Chaso) of Vizianagaram reflected in their writings the sufferings of the underprivileged. They espoused the cause the poor.

Another author, Kalipatnam Rama Rao (Kara), who lived in Visakhapatnam for many years, has since moved to Srikakulam, where he runs an organisation whose objective is to preserve literary masterpieces and improve Telugu language and literature.

NORTH coastal Andhra was witness to several milestones in the freedom struggle. But the Manyam Pituri (rebellion in the agency area) slogan raised by Alluri Sitarama Raju in the Visakha tribal belt, is considered by the Telugu people to be a landmark. Disgusted by the harassment and exploitation faced by the tribal people at the hands of the British, Sitarama Raju gathered the tribal people and launched an armed struggle against the English. Ultimately Sitarama Raju was captured and executed, but his life inspired many a Telugu.

The region is dotted with several samasthanams and zamindaris, which continue to command respect. Descendants of the Vizianagaram royal family, particularly the late P.V.G. Raju, the last coronated king in India, still contribute to the development of education in their areas.

Yet, it was in this region that an armed extremist uprising took shape after the formation of the Andhra Pradesh State. In the late 1960s and the early 1970s, Srikakulam witnessed naxaline struggles against exploitation. The movement spread to Visakhapatnam district. (Vizianagaram was then part of Visakhapatnam district.) The government put down the naxalite movement with an iron hand and followed it up with socio-economic reforms. The extremism is now concentrated in the Visakhapatnam region and along the tribal belts of north coastal Andhra.

The region abounds in pilgrim centres and places of tourist interest. The shrines of Srikakulam, Simhachalam, Annavaram and Draksharama draw thousands of devotees every day.

The Veera Venkata Satyanarayana Swamy temple atop Ratnagiri hill on the banks of the Pampa in Annavaram (East Godavari) is unique in that the shrines of Brahma, Vishnu and Maheswara are ensconced in a three-tier structure here. The worship of Satyanarayana Swami, which is common in Andhra households, in Annavaram is considered auspicious.

Annavaram is situated along the Chennai-Calcutta National Highway 5 and the trunk railway line, making it accessible by road and rail.

Srikakulam district, with a 193-km coastline and a vibrant rural landscape, offers a variety of options for tourists. A rare sun temple is located at Arasavilli, 15 km from Srikakulam town. At the Kurmanatha temple, 10 km from town, Vishnu is worshiped in the form of the tortoise. It is the only temple dedicated to this, one of the 10 incarnations of Vishnu.

Salihundam on the banks of the Vamsadhara is a Buddhist site. Situated 18 km from Srikakulam, it offers a breathtaking view of the river's mouth at the Bay of Bengal. The place is said to have flourished as a Buddhist centre after the Kalinga war.

The tribal belt of Srikakulam district and the Sitampeta area offer a glimpse into the lifestyles of Girijans.

Although the region has immense tourism potential, this is one sector that is yet to be tapped fully by the State Government.

In order to popularise the tourist spots of Vishakapatnam, the district administration has been conducting a Visakha Utsav every year. According to J.S.V. Prasad, the Visakhapatnam District Collector, Visakha Utsav '99, which should have been conducted in December, has been shifted to February 2000 to make it the Visakha Millennium Utsav. Similar festivals are being held at Bheemunipatnam and Araku

.... Visakhapatnam

Places of tourist interest

Port town Visakhapatnam : Come, discover the history behind this bustling commercial Visakhapatnam City. Walk on miles and miles of golden sands.

Simhachalam : Drop by at Simhachalam's famous 11th Century Temple dedicated to Lord Narasimha (Chandanayatra Festival (Mar - April).

Borra Caves : Step into the fascinating Borra Caves-about 90 kms from Visakhapatnam- A million years old, these caves have magnificient stalacitite and stalagmite formations. Truly worth seeing.

Buddhist Heritage Sites Sankaram, 41 Kms from Visakhapatnam
Bavikonda : 16 Kms from Visakhapatnam
Thotlakonda: Close by Bavikonda

Excursions : Simhachalam, Bheemunipatnam, Sankaram, Bavikonda, Thotla Konda, Kondakarla Bird Sanctuary, Araku valley, Borra Caves

For Further Information, Contact

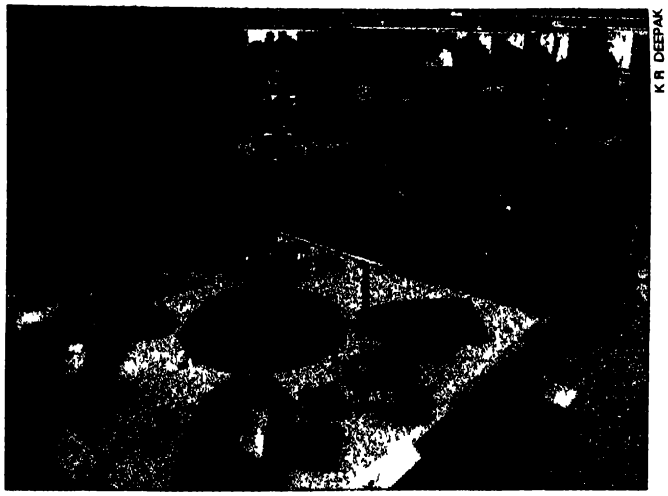
Dr. Lankapalli Bulli Raju Complex, Siripuram, P.O.
Visakhapatnam - 4

Dolphin's Nose : Traipse down to the southern part of Visakhapatnam. You'll be suprised to see the rock looks like a dolphin!
Kailasagiri : 30 Acres of sprawling majestic Hill top garden over looking the bay.

Araku Valley : Move on to the sights and sounds of the lush green Araku Valley. Journey upto this picturesque valley at an altitude of 3100 feet on the Eastern Ghats in a train.

Bheemunipatnam : Drive along one of the longest beach roads in India from Visakhapatnam to Bheemunipatnam. A good 24 kms away. Go back to the 17th century. Discover the remains of a Dutch settlement, ruined fort, armoury and the oldest Dutch cemetery.

ANNUAL TOURISM EVENT



Visakha Utsav

A three day festival every year brings to life the arts, crafts culture & cuisine of Visakhapatnam.
February 18th to 20th, 2000

ing year" with the financial results for the first seven months indicating a net profit of Rs.113 crores and a sales turnover of Rs.826 crores. The company is also diversifying into the fertilizer sector by tapping sulphuric acid from the greenfield zinc smelter, for a 850 tonnes-a-day di-ammonium phosphate (DAP) plant in Rajasthan. HZL's plans for the next five years entail the expansion of the existing zinc metal production capacity by 20,000 tonnes.

Bharat Heavy Plate and Vessels and the Essar Pelletisation plant are moving ahead. LG Polymers Ltd., the erstwhile Hindustan Polymers which has been taken over by the LG Group of South Korea, has recorded a turnaround.

The mini-cement plants, which were operating basically as grinding mills, largely appear to be winding up. They have been unable to penetrate the market as bigger players are providing quality products at competitive rates.

K R DEEPAK

Inside a diamond processing unit in the Visakhapatnam Export Processing Zone.

The Visakhapatnam Export Processing Zone (VEPZ) has opened a new corridor with well-developed plots and standard design factories on renewable long-term lease at low rates. VEPZ provides adequate water and power supply, telecommunication facilities with high-speed data communications to the units situated in the zone. According to K. Ratna Prabha, Development Commissioner, the Government has given several incentives and concessions for setting up 100 per cent export-oriented units in the zone. These include a five-year tax holiday, duty-free import of capital goods and exemption from excise and other levies.

The small scale industries (SSIs), despite enjoying excise and sales tax exemption, have largely failed to remain healthy. They had been complaining that they faced stiff competition from units in other States in the face of high rates of sales tax in Andhra Pradesh. With the introduction of a uniform sales tax structure throughout the country, hopefully they will do better in the coming years.

How to set up your Software EOU for a song.

MAA BOZELL

For a prospective software exporter like you, VEPZ offers such unmatched benefits as:

- 2Mbps optic fibre link through STPI, Hyderabad which provides you with high-speed access to more than 165 countries worldwide.
- Earth Station to be Commissioned shortly.
- 25% concession on datacom and internet charges up to 2000 AD.
- Exemption from datacom link installation charges till 1999 year-end.
- Ready built accommodation at a nominal lease rent.

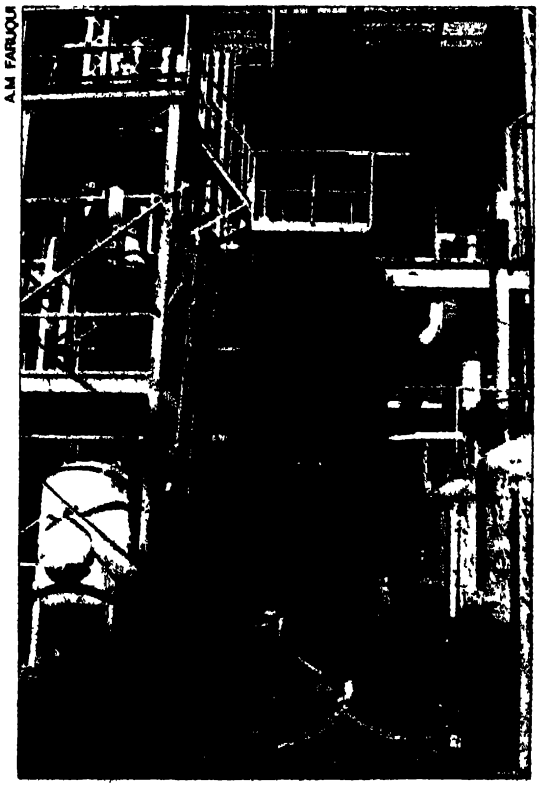
A tragedy without end

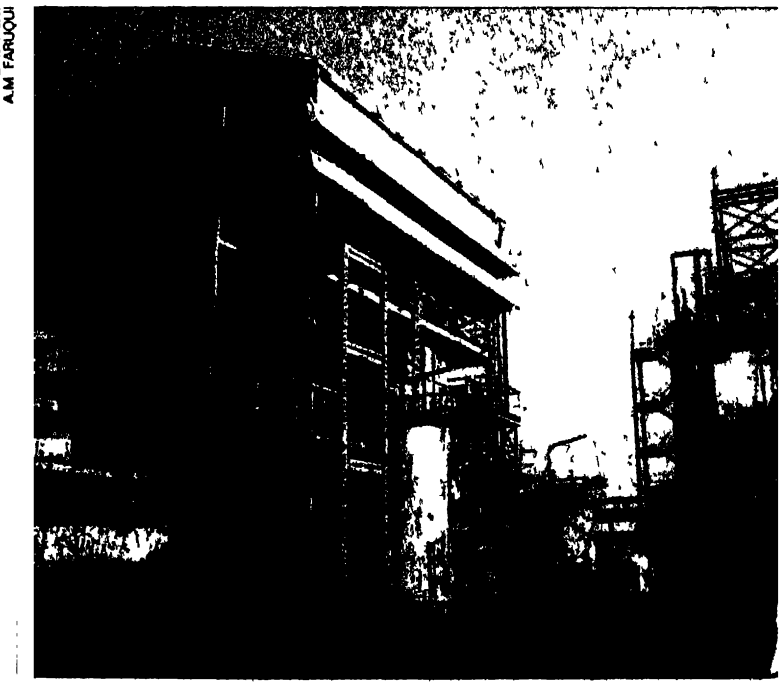
The 15th anniversary of the Bhopal gas tragedy marks another painful reminder of the survivors' struggle against an administration insensitive to their travails.

V.VENKATESAN
in Bhopal

ALONE watchman guards the entrance to the site of the abandoned pesticide factory of Union Carbide India Limited (UCIL), the Indian subsidiary of the multinational, Union Carbide Corporation. Overhanging creepers and accumulated rust on the machinery have not erased memories of the disaster that struck Bhopal on the night of December 2 and 3, 1984. And angry graffiti scrawled years ago on the walls add to the poignancy of these memories.



On that night, routine maintenance operations in the methyl isocyanate (MIC) plant went haywire and a large volume of water entered a storage tank containing 60 tonnes of the toxic gas. This triggered a runaway reaction, rapidly increasing the temperature and pressure inside the tank and resulting in the release of a lethal cocktail of MIC, hydrogen cyanide, monoethylamine and other chemicals into the night. A northerly wind carried close to 40 tonnes of chemical fumes across 40 sq km, like a shroud over the city of about one million people.



According to official figures, the disaster claimed 3,000 lives immediately and left thousands physically debilitated. Livestock lay dead, injured or infected. Unofficial reports, however, put the immediate toll at 8,000 and claimed that more than 16,000 persons died in subsequent years. It was estimated that more than 500,000 suffered injuries in the aftermath of the gas tragedy. Exposure-related complications reportedly claim 10 to 15 lives every month. The official agency for recording disaster-related mortality stopped its work in December 1992.

The gas impaired eye and lung tissues and the nervous system. Survivors silently suffer acute medical complications, which have been aggravated by the city's inadequate and inefficient health services. Breathlessness, diminished vision, loss of appetite, pain, recurrent fever, persistent cough, neurological disorders, fatigue, weakness, anxiety and depression are common symptoms among the survivors. An activist working among the victims aptly summed up the plight of the survivors as the "second Bhopal tragedy".

THE Indian Council of Medical Research (ICMR) conducted 25 research studies in Bhopal between 1985 and 1994, but several of them were terminated prematurely. The ICMR is yet to release its reports, but it has apparently conveyed its preliminary findings to the Central and State governments.

Sambhavna Trust, a non-governmental organisation, claimed that the ICMR established that the toxins from the UCIL factory entered the bloodstream of the people who were exposed and damaged their lungs, brain, kidneys, muscles and gastro-intestinal, reproduc-

tive, immunological and other systems. The damage to the respiratory system, particularly lungs, was most acute.

State Government officials dispute the trust's claim that there has been a rise in the incidence of tuberculosis, cancers and infertility among the population exposed to the gas. Officials criticised a bid by the trust to raise funds by publicising (through a women's magazine) the alleged rise in the cases of irregular menstrual cycles among affected women.

D.S. Misra, Secretary, Bhopal Gas Tragedy Relief Department (BGTRD), told *Frontline* that studies revealed that the general fertility rate was higher among the exposed population than among the non-exposed population. He claimed that the number of women in the childbearing age group with irregular menstrual cycles was 1.9 per cent in the exposed population and 1.54 per cent in the unexposed population. This degree of difference is normal, he argued. Scientific circles, he said, would consider as normal even instances of up to five per cent of the population suffering such problems.

PABLO BARTHOLOMEW/CORBIS

At the burial site of a gas-leak victim.

Activists, however, said that girls who had been exposed to the gas as infants had chaotic and painful menstrual cycles on attaining puberty. Several girls have three to four cycles in a month, and there are girls in their late teens who have not yet attained puberty, they said. According to organisations representing survivors, it is difficult to find marriage alliances for girls from the affected areas and many women, who had disorders of the reproductive system, were deserted by their husbands.

An epidemiological survey by an International Medical Commission (IMC) team, comprising 14 medical specialists from 11 countries, reported in January 1994 that the exposed population in Bhopal showed signs of affliction in multiple organs. Clinical examinations by the team showed significant levels of lung impairment, marked reduction in the control of limb movements, and reduced memory function. It is estimated that more than 120,000 children, women and men suffer a host of acute exposure-related medical complications.

The State Government, however, has apparently no record of the gas-leak victims or their diseases. It claims that it has been concentrating on the treatment of 7,500 chronically ill patients, 90 per cent of them with respiratory disorders. "We have computerised all these cases, and review their progress from time to time," Misra said. He said that about 1,200 patients were identified in the worst-affected wards of the Bhopal Municipal Corporation, 13 and 20, where an official team has conducted a door-to-door survey. This survey, started in September, will be conducted every six months. The health of the patients identified will be monitored rigorously after clinical tests, he said. Asked why the government did not choose other wards – 36 out of 56 wards which were also declared affected, he said that the department wanted to start with the worst-affected wards.

PUBLIC health care expenditure in Bhopal is shared between the Central government, which provides 75 per cent of the finance, and the State Government. The latter implements health care services.

The State Government has primarily aimed to increase the number of hospitals, rather than ensure the delivery of appropriate medical care. As a result, many patients have chosen not to go to government hospitals where the treatment, though free, was insensitive and time-consuming. Instead they have opted for ill-equipped, expensive and sometimes less qualified private doctors. The number of private doctors in Bhopal has increased significantly. Doctors working in government hospitals that were established specifically for treating the gas-leak victims have not been restrained from setting up private practice.

The IMC confirmed in 1994 that therapies prescribed for ailing survivors were aimed at temporary symptomatic relief rather than any long-term amelioration of chronic diseases. The lack of information on the nature of MIC – owing to UCC's refusal to share information on the gas – is a problem for medical practitioners. There is no known antidote to MIC. Thus the State Government simply follows the ICMR's finding that treatment can only be symptomatic and that routine treatment methods should be followed.

Official records show that in the last six years about 4,000 patients visited government hospitals everyday. Yet there is no record of the treatment offered to these people and no information on its efficacy. Misra says that if patients have lost faith in government hospitals, the frequency of their visits would have declined too. Critics, however, turn this argument around – the fact that patients make frequent visits to government hospitals shows that the treatment they provide is ineffective and time-consuming.

The State Government has not fully met its financial obligations with regard to medical care, apparently owing to a

A.M. FARUQUI

A memorial for the victims in front of what was once the UCIL factory.

financial crunch A common complaint against government hospitals and clinics is that equipment are non-functional and medicines are out of stock The Pulmonary Medicine Centre (PMC), completed in 1994, provides specialised medical care to persons with respiratory disorders, but it is not adequately staffed For two-and-a-half years, the 30-bed PMC had apparently provided in-patient treatment to 1,061 gas-leak victims Against a requirement of 25 high-speciality doctors, activists say, the PMC has only 15, of which five are apparently on contractual employment Besides, the doctors with the required specialisation are few in number. Activists allege that some of the equipment in the PMC remain unused, perhaps because no one knows how to use them.

The Indira Gandhi Hospital for Women and Children was completed in 1994, but it started functioning only in August this year. Instead of the 150 beds planned, it has only 50. Work on a 540-bed Hospital (to be named after Kamla Nehru) began in 1987, but is yet to be completed. The expenditure incurred so far has been nearly three times the budgeted amount. The report of the Comptroller and Auditor-General of India, which examined the operations of the BGTRD, pointed out gross financial irregularities in the construction of hospitals in Bhopal

The Kamla Nehru hospital is supposed to be a super-speciality referral hospital. The State Government sought Rs 27 crores from the Centre as a special grant to equip the hospital so that it could start functioning from mid-December this year Exclusively meant for the gas-leak victims, the hospital will be initially run by the BGTRD, though the executive control of the hospital may be eventually handed over to the Directorate of Medical Education (DME) Survivors fear that when the DME gains control of the hospital, it will become a general hospital without focussed treatment for gas-leak victims Official sources, however, affirm that the hospital would always cater to the gas-leak victims, irrespective of the nature of its management Activists have protested against the State Government jumping from one project to another, without completing any

Government hospitals meant for the gas-leak victims also cater to the general population also Organisations representing survivors insisted that the hospitals should be exclusively for the gas-leak victims and that other patients should go to the general hospitals This would ensure that the money being spent in these hospitals is used entirely for the treatment of gas-leak victims The government rejected the plea saying the all people living near the hospitals should also have access to treatment Official sources suggested that the government could consider asking such patients to pay for medicines

Bhopal has far too many hospitals today The ratio of hospital beds to population is probably higher in Bhopal than elsewhere in the country However, in the absence of focussed treatment for the gas-leak victims, based on information and research, hospitals do not offer effective care Without a system to record and exchange data among the government hospitals for the gas-leak victims, it is not possible to compare clinical and research data. The apparent lack of interest in advancing research in the area is attributed to the dependence of the Central and State governments on multinational companies.

Organisations representing the survivors have demanded creation of health records for all gas-leak victims in order to ensure that they get the best treatment in all hospitals and clinics. This will also save

V. VENKATESAN

THE battle to bring to book persons responsible for the Bhopal gas disaster carries on. On November 16, a petition seeking a jury trial was filed on behalf of the victims in a district court in New York. This move is a direct consequence of the failure of the Indian judicial system and government to bring the case to its logical conclusion.

Besides seeking appropriate compensation for themselves, organisations and individuals representing the survivors of the disaster have sought a decree from the U.S. court that the Union Carbide Corporation (UCC), a multinational company based in the U S., and its former Chairman Warren Anderson were fugitives from justice for deliberately evading the Bhopal district court's jurisdiction. They sought to invoke the jurisdiction of the same U S court that determined the question of "forum" in 1986, sending the Indian government's compensation suit for more than $3 billion back to the Indian courts on the condition that the UCC would submit to their jurisdiction.

The survivors held that UCC's conduct amounted to a violation of international criminal law, which prohibits widespread or systematic killings or other inhuman acts against a civilian population. They also accused the UCC of a policy of systematic racial discrimination, thus endangering their human rights.

There is substantial evidence to show that cost-cutting measures directed by UCC's headquarters at Danbury, Connecticut, led to the disaster at the Bhopal plant of UCC's Indian subsidiary, Union Carbide India Limited (UCIL). The measures approved and monitored by the company included the use of substandard construction material, retrenchment of workers and the survivors from irrational medication and improper medical consultation.

There has hardly been any systematic effort to document the social and economic impact of the disaster. Over 70 per cent of the exposed population are in the unorganised sector, earning subsistence wages as labourers or small-time traders.

About 50,000 of the affected people are estimated to be in need of alternative means of livelihood However, less than

Trials and tribulation

The disabling of vital safety systems. The refrigeration unit, essential to keep the toxic methyl isocyanate (MIC) at near-zero temperatures, was shut off to save about $50 a day. Senior company officials who were privy to a safety audit by U.S. experts, knew of 61 potentially hazardous incidents, 30 of them major and 11 categorised as "dangerous" in the phosgene/MIC units, at least two years prior to the disaster. Survivors have alleged that nothing was done to reduce the hazards.

With the cooperation of factory workers, the Central Bureau of Investigation (CBI) presented a strong case in the Bhopal district court, linking key managerial decisions to the disaster. In 1987, the CBI pressed charges against UCC, its Asian subsidiary, Union Carbide Eastern in Hong Kong, UCIL and nine officials, including Warren Anderson.

The 12 accused were charged with committing culpable homicide, acts leading to the poisoning of animals and other serious offences punishable by imprisonment (up to 10 years) and fines. In 1996, in response to an appeal by the accused Indian officials of UCIL, the Supreme Court passed an order diluting the charge of 'culpable homicide' to 'death caused by negligence', thereby reducing the maximum sentence from 10 years to two.

Trials of the accused (Indians) are going on at an exeruciatingly slow pace before the Chief Judicial Magistrate (CJM), Bhopal. It is rare for a hearing to take place every month. And since the proceedings began, UCC and its officials have repeatedly chosen to ignore judicial summons. Anderson was served summons through the Interpol, and when he repeatedly refused to obey them, the CJM proclaimed him an absconder. A non-bailable arrest warrant was issued against Anderson. The court also attached the shares of UCC and UCIL. However, the Central Government did little to seek the extradition of the accused (foreigners).

The Supreme Court first agreed to a settlement between UCC and the Government of India to cancel the criminal charges against the company in exchange for a $470-million compensation. In response to a revision petition filed by the National Front government in 1990, the Supreme Court upheld the compensation package, but revoked the criminal immunity it had approved earlier.

Hearing an appeal against the attachment of the UCIL's shares, the Supreme Court allowed the sale of the shares and use of the proceeds to build a super-speciality hospital for the victims. This was to be administered through a new trust, the Bhopal Hospital Trust, with its office in London. By putting its own nominee in charge of the trust, UCC virtually escaped all norms of accountability. The hospital, which has been dubbed a public relations exercise by the UCC management, is likely to start functioning early next year.

ON August 4, Dow Chemicals, a U.S. multinational, announced its plan to acquire UCC. Both companies have long been part of the U.S. military-industrial complex. Dow's role in manufacturing the defoliant Agent Orange, which caused brain damage and birth defects on a vast scale in Vietnam, is well documented. Survivors of the disaster have launched a campaign named "Dow shall assume liabilities". They sent a memorandum to the Chief Executive Officer of Dow Chemicals, William F. Stavropoulos, reminding him of the UCC's liabilities arising out of the Bhopal disaster and seeking Dow's plan to discharge pending liabilities.

ACCORDING to official records, more than one million injury claims and 22,149 death claims were registered. Officials say that less than 100,000 injury claims remain to be decided. The Bhopal Gas Tragedy Relief Department is hopeful of disposing of the cases before March 2000. Over 6,000 deaths were judged to be exposure-related but the majority of the death claims were "converted" arbitrarily into injury claims. Among those who received compensation, more than 95 per cent got Rs. 25,000 for injuries; in the case of the death claims the compensation was often less than Rs.1 lakh. Only about 7,000 claimants received Rs. 1 lakh as compensation and about 200 claimants received more than Rs. 1 lakh. A sum of Rs. 10,000 is routinely deducted from the compensation amounts to account for the interim relief paid by the government. The compensation is hardly adequate to meet the medical bills of the patients. None of the claimants has been paid any interest on the compensation amount. And no compensation has been paid to those who suffered mental disorders owing to the gas exposure.

While the real victims were paid less than what they deserved, many people unaffected by the gas received Rs. 25,000, by virtue of being in the city on the day of the disaster. Widows among the gas victims received a monthly pension of Rs. 200 from the State Government. This pension was stopped when their claims were settled. Typically the widows had to share the amount with other family members. Abdul Jabbar, Convenor of the Bhopal Gas Peedit Mahila Udyog Sanghatan, said that there were cases of widows having been abandoned by family members and reduced to penury. He suggested that widows be given life-long pension. ■

100 gas-leak victims have found regular employment under the government's schemes. In 1987, a special industrial area comprising 152 worksheds, constructed at a cost of Rs. 8 crores, was started to train and employ over 10,000 survivors. Of these, only 16 sheds are functional, though partialy and 52 have been converted into barracks for the Rapid Action Force, which moved in after communal riots in 1992.

There is no official record to show whether any of those who received industrial training have been employed anywhere. A programme that offered women survivors jobs as tailors ran successfully from 1986 to 1992, employing 2,300 women and making a yearly profit of Rs. 1 crore. This programme was terminated apparently because at one stage, unsold stocks of clothes worth Rs.66 lakhs had accumulated.

Organisations representing survivors have urged the State Government to set up a special industrial estate to provide employment to the survivors. They have also demanded reservation of jobs for the gas-leak victims in the railway coach factory in Bhopal. They have also demanded that pensions be provided to persons widowed and orphaned by the disaster and to those who are so disabled that they cannot earn a livelihood. ■

The earth watchers

Greenpeace's Rainbow Warrior comes to India as part of a tour aimed at creating awareness about hazardous wastes.

LYLA BAVADAM
in Mumbai

When the Earth is sick and the animals and plants begin to die, then the Indians will regain their spirit and gather people of all nations, colour and creed to join together in the fight to save the planet and they will be known as the Warriors of the Rainbow.

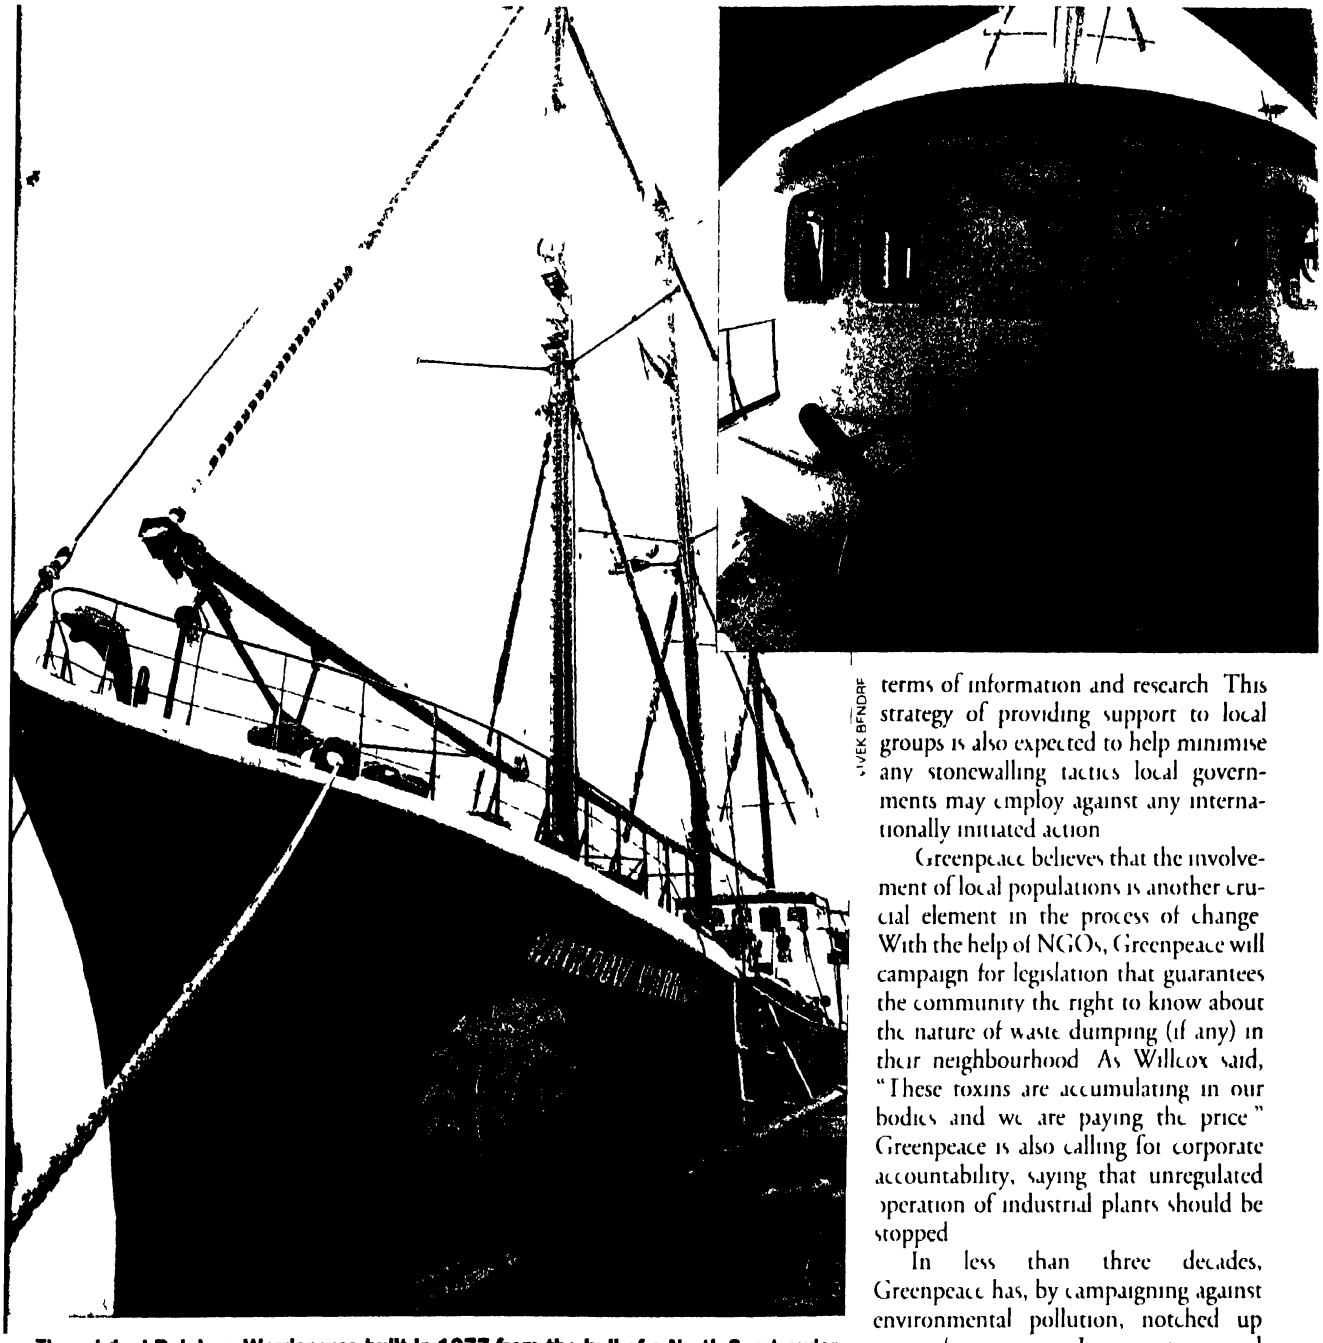
– prophecy made by "Eyes of Fire", an old woman of the Cree tribe.

ON its maiden voyage to India, as part of the Toxic Free Future Tour of Asia, the 55-foot, three-mast ship Rainbow Warrior of Greenpeace docked at Mumbai's Ferry Wharf in the last week of November. The tour, which began in South America last year and passed through ports in the northern regions of Europe and the Mediterranean, is aimed at creating awareness about the trade in hazardous waste and the export of technology that creates hazardous waste. The Toxic Free Future Tour was planned to coincide with the 15th anniversary of the disaster in the Union Carbide factory in Bhopal.

A report prepared by scientists Ruth Stringer and Kevin Brigden of the Greenpeace Research Laboratories was released in Mumbai on November 29. Titled "The Bhopal Legacy", it states that the disaster goes beyond the gas leak. "The disaster is continuing," says Stringer. "The environment is being polluted even today." On analysing samples of soil, water and waste from the factory site, Stringer and Brigden found that there was "severe contamination with heavy metals and toxic organic chemicals". Some samples had 12 per cent mercury, which is 20,000 to six million times higher than in soil elsewhere. The researchers allege that sacks of chemicals still lie around inside the factory and that these are leaking into the soil and contaminating the groundwater. They say that the drinking water has a contamination level that is 1,000 times higher than is acceptable. The toxic substances affect the liver, kidneys, intestines and the nervous system. According to them, the technology to destroy these chemicals exists, and all that is needed is funds and the political will.

Bhopal is a microcosm of what toxic pollution by persistent organic pollutants (POPs) will make the world in the long term. Disseminating information about POPs will be central to Greenpeace's tour of Asia. Nityanand Jayaraman, Greenpeace's Asia coordinator, said: "There are no safe levels of exposure to POPs. So we call for a cessation of their production. The industry, however, wants a regulation of these products."

Peter Willcox, captain of Rainbow Warrior, spoke about how he first came across POPs. "I became aware of toxic pollution in 1973 when working on the Hudson river in New York. Environmentalists there were patting one another on the back because the river was being rid of the petroleum and sewage pollution that was so easy to see. Then we learnt about poly chlorinated biphenyls or PCBs, that had settled on the river bed."



Greenpeace will continue with its basic strategy of campaigning against the abuse of the environment by lobbying with the relevant authorities and international conventions and promoting environmentally responsible technologies and products.

POPs, including PCBs, have a long life. They emit toxicity into the environment gradually by getting into all the life forms that come into contact with them. They survive in fatty deposits and float in the air, spreading toxicity. Since PCBs survive well in fatty deposits, their effect is severe on creatures at the apex of the food chain, such as human beings, whales and polar bears. "Today, polar bears have the highest concentration of PCBs," says Willcox.

Greenpeace is also targeting a group of chemical compounds called dioxins, which it treats as toxic pollutants. Dioxins are the byproducts of industrial processes such as PVC manufacture, pesticide production, incineration, bleaching of pulp and paper with chlorine, and smelting and recycling of metals. Like PCBs, dioxins too are transported across vast distances, even by air and ocean currents. Because of this, dioxins can be found in the tissues, blood and breast milk of humans in most countries.

Stricter environmental regulations in the industrialised countries have led to the transfer of old and obsolete technology to nations where regulations are weak or non-existent. The latter category of nations includes India. Quoting a 1989 government circular, Greenpeace states: "According to the Indian government, industries that engage in activities involving TCCD (the most toxic form of dioxin) have specific responsibilities such as assessment of major hazards, measures to prevent accidents and limit impairment of human health and environmental pollution, proper information for workers, emergency plans etc. Unfortunately, these requirements are not enforced and there are no known standards for controlling or reducing emissions of dioxin into air, land or water. Greenpeace knows of no certified laboratory in India equipped to analyse for the presence of dioxin."

With their tradition of peaceful and hands-on protests, Greenpeace activists have sailed into nuclear test zones, blocked toxic effluent pipes and manoeuvred themselves between whales and harpoons. While Greenpeace does not envisage such direct action immediately in the current context, the organisation will continue with its basic strategy of

VIVEK BENDRE

The original Rainbow Warrior was built in 1977 from the hull of a North Sea trawler. Its earliest campaigns included those aimed at protecting whales and seals, eliminating high-sea drift nets and opposing nuclear testing. In 1985, when the Rainbow Warrior was docked in Auckland, New Zealand, before sailing to the Pacific atoll of Mururoa for a peaceful protest against the nuclear tests being carried out by France in the atoll, French secret service agents attached limpet bombs to its hull. The ship sank, killing Greenpeace photographer Fernando Pereira. Greenpeace, however, was undeterred and bought another ship. A three-mast schooner was rebuilt on the hull of a fishing vessel called Grampian Fame. The present Rainbow Warrior, which was launched in 1989, is equipped with the latestelectronic navigation, sailing and communication equipment.

campaigning against the abuse of the environment by lobbying with the relevant authorities and international conventions, providing alternative choices and solutions in the form of studies and reports, and promoting environmentally responsible technologies and products

According to Willcox, in India Greenpeace "will network using NGOs (non-governmental organisations), offering them scientific information support." Local groups will be provided support in terms of information and research This strategy of providing support to local groups is also expected to help minimise any stonewalling tactics local governments may employ against any internationally initiated action

Greenpeace believes that the involvement of local populations is another crucial element in the process of change With the help of NGOs, Greenpeace will campaign for legislation that guarantees the community the right to know about the nature of waste dumping (if any) in their neighbourhood As Willcox said, "These toxins are accumulating in our bodies and we are paying the price" Greenpeace is also calling for corporate accountability, saying that unregulated operation of industrial plants should be stopped

In less than three decades, Greenpeace has, by campaigning against environmental pollution, notched up quite a few successes It was instrumental in bringing about a ban on dumping toxic waste into the sea and on the export of hazardous waste from industrialised to industrialising nations. In India, Greenpeace's efforts to ensure that Asia does not become a dumping ground for hazardous waste led to the 1997 Supreme Court order that banned the import of such substances

Summing up the danger posed by toxic pollutants, Willcox said "If I have learnt one thing about POPs in the last 26 years, it is that they represent a very serious threat to our health And the longer we wait, the higher the cost we will pay for producing them" ■

Prejudice as 'education'

The Sangh Parivar has intensified its efforts to promote communal hatred through its "intellectual violence" and by rewriting the standards of school curriculum revision.

BEYOND THE OBVIOUS

PRAFUL BIDWAI

IF Human Resource Development Minister Murli Manohar Joshi has his way, our children and grandchildren will grow up believing that "Hindu culture", as the Sangh Parivar defines it, is the sole influence that has shaped India since the Vedic times. This culture, they will learn, has remained unchanged since time immemorial. All other cultures, civilisational influences and traditions are extraneous, "impure", alien, not part of the Indian "heritage". They are at best only marginal to the values relevant to us. In this view, "Bharatiya culture" is mankind's highest achievement. It is at once all-encompassing, but also infinitely tolerant (never mind the contradiction between the hegemonic ambitions of being "all-encompassing", and respect for other views).

Among the other "truths" and "values" that textbooks will teach our schoolchildren:

★The Aryans were India's original inhabitants; they never displaced or colonised Dravidians or indigenous tribal people and forest-dwellers.

★ According to the Ramayana legend, Sri Lanka was an opulent "city". It had "excellent houses, decorated with wonderful... jewels, golden archways, pearls, diamonds, gems, silver, etc.." But it was not "cultured". In "refreshing contrast, Ayodhya was both civilised and cultured. People were learned, free from greed, truthful and with no proclivity towards stealing or petty-mindedness".

★There was no contradiction between Hinduism, on the one hand, and Buddhism or Jainism, on the other – despite rich evidence on the hounding and banishment of these faiths and their followers. Hinduism merely "absorbed" Buddhism.

★ Indians are "a race". More, they have "a mission" as a race. This race must understand "the destiny it has to shape, the place it has to occupy in the march of nations..."

★ Hindu and Muslim "periods" clearly mark the relevant watersheds in Indian history.

★ It is "a fundamental postulate of Hindu thought that every way of life has its own contribution to make..." But "the ultimate reality" is defined by Krishna alone. "He proclaims a doctrine which is fundamental to all Hindu thought. . Owing to this approach we are reinterpreting our own doctrines and doing readjustment (sic.) For example, we have absorbed Buddhism..."

★"Our concept of the joint family is a unique contribution in the history of mankind. Generation after generation we have developed it." The break-up of some of the oppressive structures of the joint family is thus not progressive, but a setback!

★India, irrespective of who ruled it, has never tried to dominate or subjugate other people, cultures or lands – never mind our marauding kings, brutal rajahs or the fact that whole ministries were once assigned by "Hindu" kings to the specific task of destroying and looting temples!

★"Bharatiya culture is the only culture which has understood the life problems (sic) in their totality and has made a continuous effort to solve them. In the history of the world, it is the only effort to see the science, philosophy, religion, psychology and social life in an integrated form." (sic)

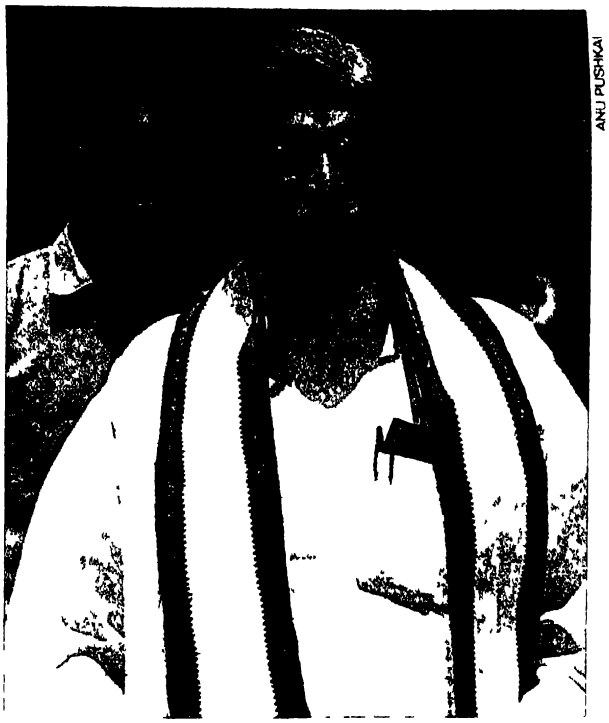
★ "Spirituality is the core of our culture. We have tried to see the reality or truth hidden in the material world. This is the theme of Bhartiya life work. It is the backbone of her existence, the foundation of her being – the spiritualisation of the human race" (sic).

★ The "spirit of Bharat" and "Bharatiyata" is Dharma. This is "the ultimate source of all values of human society". In the Vedic period, "there existed no state, no king, no penalty and no criminal, all protected one another by virtue of Dharma". The best description of Dharma is naturally to be found in the Manusmriti, "which gives ten characteristics which are related to human conduct .."

★ "Naturally, Bharat excelled in every branch of Science – Mathematics, Astronomy, Chemistry, Sculpture, Pharmacology, etc. Our sages realised reality lying in every sphere of life" Naturally, all of them, from Charak to Bhaskaracharya, were Hindus. Also, "in each and every field of art, architecture, sculpture, painting, dance, drama and music, we were the leaders". Our temples "...may perhaps be said to be infinitely superior to the cumulative achievements of our artists" (sic).

★ "When the central idea driving and inspiring the way of life ceases to exist, a culture dies along with its adherents The cultures of Greece, Rome and Egypt died the day the representatives of those lands failed to find fulfilment in living up to its values. So it is our duty to preserve our ancient heritage..."

★ "We firmly believe in the Vedantic concept that each soul is potentially divine... We have to reach the concept of 'I am God'..." The basic task of education today is to inculcate this knowledge.



These ideas form the core of the "discussion papers" being prepared by some of the principal institutions that draw up school curricula, including the National Open School (which has over a million pupils, and from whose document the verbatim quotes are taken here). Other bodies such as the National Council for Educational Research and Training (NCERT) and the Central Board of Secondary Education (CBSE) are also about to adopt a similar approach to defining "Bharat" and promoting "Bharatiyata" through education. These papers not only stipulate the general objectives and goals that educational

ourses must achieve, but also ubstantially lay down some of heir core content. The emphasis s on Hindutva with its exclusivist, chauvinist notions of nationalism.

All future writers of our textbooks will have to conform to these values, objectives and content descriptions. In practice, this will apply not just to the Central elementary schools and the CBSE systems, but to educational institutions at the State level too. Most of these participate either in the donor-driven District Primary Education Programme (DPEP), or the Sarva Shiksha Abhiyan which Joshi has just inaugurated to consolidate all non-formal education - even as he has more or less dismantled the National Literacy Mission. These include the Saraswati Shishu Mandirs and the Vanvasi Shiksha Kendras set up by Rashtriya Swayamsevak Sangh (RSS) pracharaks, schools run by Friends of Tribals Society of Sangh sympathiser P.D Chitlangia, and other non-governmental organisations of the saffron variety. Joshi is also deviously using the coming amendment to the Constitution making education a fundamental right as a shield beneath which to promote the Sangh agenda.

This adds up to a massive brainwashing programme – to be accomplished through the simple device of an administrative fatwa issued by the Human Resource Development Ministry for curriculum revision. No one has ever attempted anything one-tenth as ambitious as Joshi has actually ordered into existence. Earlier, textbooks, especially history textbooks, were manipulated to introduce a communal bias. There have been many instances of extravagant claims about India's achievements and arrogant or disdainful statements about other cultures and peoples. But this is the first time that the whole curriculum for Classes X to XII is being so comprehensively rewritten. This is not revision with a view to updating it. It involves violent recasting and radical changes – in particular, changes in values and ideologies.

These "discussion papers" are reminiscent of the fatwas issued in Hitler's Germany to inculcate the spirit of "nationalism" among schoolchildren, and to specify in the minutest detail what constitutes authentic "German culture", why the idea of racial purity, and the sacred nature of the Aryan "master race" must never be questioned. They come on top of many discrete measures that the government has taken over the past 18 months to alter the character of institutions such as the Indian Council of Social Science Research (ICSSR) and the Indian Council of Historical Research (ICHR), the University Grants Commission (UGC) and the NCERT, besides setting up the J.S. Verma Review Committee on school syllabi. Another round of senior appointments is now coming up with the impending retirement of the Vice-Chancellors of some of our best-known universities, such as Jawaharlal Nehru University (JNU), Jamia Millia Islamia, Aligarh Muslim University, and Santiniketan (founded by Rabindranath Tagore).

ANU PUSHKAL

Human Resource Minister Murli Manohar Joshi.

Institutions are vital to democracy. Running them well means appointing first-rate people committed to inclusivism and pluralism, and open to new ideas.

MURLI MANOHAR JOSHI is clearly the most dedicated hardcore RSS Minister in the present government. An RSS insider has been quoted as saying, "We think Joshiji has done the best work. He is the most frequent to come here to consult RSS organising secretary K. Sudarshan. We know that our project of nation building cannot be accomplished without basic education". Joshi is certainly a pillar of Hindutva. But not to be left behind are Ananth Kumar, Minister of State for Culture, and Arun Jaitley, Minister of State for Information and Broadcasting. Ananth Kumar is threatening to bring in legislation to protect India against "cultural invasion" from the West – read, promotion of traditional hierarchical values, along with grotesque forms of rampant consumerism and "VJ culture". Arun Jaitley has already shown his true colours by destroying the whole edifice of autonomy in Prasar Bharati through a single administrative fatwa, arbitrarily removing Romila Thapar and Rajendra Yadav from the board on the specious ground that there is a provision for retiring a third of all members by rotation.

This "retirement" makes a complete mockery of the idea of autonomy. Autonomy means, quite simply, that the government has no business to interfere with Prasar Bharati's day-to-day working or its overall management. Legally, it is not empowered to remove or appoint directors. But it brazenly targeted two *individual* members. Under the principle of rotation, an *objective criterion* should have been applied, like drawing lots – a procedure the Prasar Bharati Board itself proposed. The government deliberately zeroed in on Romila Thapar and Rajendra Yadav, saying that the board needs more professional journalists. (It later contradicted itself by pleading for a "broad-based" board). The action was obnoxious, and was rightly termed as "intellectual violence" by former Information and Broadcasting Minister S. Jaipal Reddy. It was aimed at moving those members who put up a lot of resistance to the BJP's depredations and its attempt to take over Doordarshan and All India Radio.

THERE is a clear pattern to the BJP's appointments – whether in Prasar

Bharati, or in educational and research institutions. This pattern goes beyond "Left vs Right" divides. Thus it is irrelevant and improper to term Romila Thapar a Marxist historian or an "ancient Indian historian with Marxist inclinations, and link this to her removal. The pertinent point is that she is a historian of exceptional eminence whom any university in the world would be honoured to have. Whether or not she is a Marxist is as irrelevant as Anthony Giddens' appointment to the London School of Economics (LSE) is. Everybody knows that Giddens is Tony Blair's guru, the theorist of the Third Way, and yet no one has sought to remove him from the London School of Economics or question his intellectual eminence on this ground. Romila Thapar was removed not because she is a Marxist, but because she is an independent minded intellectual who brooks no nonsense, and who truly believes in media autonomy.

The government and its apologists are deliberately misrepresenting the issue, thereby confusing the non committed or undecided even as it appoints unreconstructed Hindutva Right wingers marked by intellectual mediocrity (and worse) to sensitive positions. This is *not* a contest between Right and Left. It is not as if the preceding 50 years were marked by some peculiar official fondness for the Left. What they did witness was a degree of (eroding) autonomy for many institutions and a certain porosity and openness, often combined with respect for quality. Whatever one might say about Kamaladevi Chattopadhyay, Pupul Jayakar or Kapila Vatsayan, it is undeniable that they were genuine scholars and serious institution builders. The Indira Gandhi National Centre for Arts (IGNCA) is being attacked for utterly despicable, petty, reasons by those who loathe and dread autonomy.

Institutions are vital to democracy. Running them well means appointing first-rate people committed to inclusivism and pluralism, and open to new ideas. Handing them over to bigots, philistines and people with sectarian and exclusivist agendas is the surest recipe for ruining them. That is why it matters less that M L Sondhi is right-wing than that he is a mediocrity, who will damage the ICSSR with his agenda. Again, if B R Grover of the ICHR had some decent publications to his credit and a half-way respectable academic record, his sympathies for the communal school of history writing might have been easier to forgive. As it happens, the man has nothing but Hindutva prejudice to show for himself.

It is not often (at least in India) that the Right produces distinguished intellectuals. People like Girilal Jain are rare exceptions. The run-of-the mill right winger, especially of the saffron variety, is insecure and paranoid, and far too vengeful to want to run any institution in a consensual, open, democratic way. He is unreceptive to new ideas. For the most part, his intellectual foundations are traceable to the early years of the century, and to V D Savarkar, M S Golwalkar and Jadunath Sarkar. Most communal historians, for instance, remain untouched by the new schools of historiography that go beyond the colonial and nationalist divides and, as Romila Thapar says, involve a paradigm shift. In this shift history is treated not as information laid out in a chronological order but an exploration and analysis of society and the past, all of which are deeply influenced by a range of ideologies. For communal historians, the *very purpose* of their (rigid) discipline is to glorify India.

It is of such stuff that Hindutva's education and culture project is made. This project is far more dangerous and insidious than the construction of the Ram temple. It involves manipulating minds, infiltrating hatred into them, encouraging them to think smugly in stereotypes, and making people's self-identity dependent on bigotry and false pride. Ultimately, the project means yoking the mind to a hateful, communal, nationalism – for generations to come. Textbooks are not revised frequently. The last major curriculum revision was way back in 1976. What happens to today's battle over school curricula will influence a whole generation. That's why Murli Manohar Joshi's despicable Project of Prejudice must not be allowed to prevail ■

There is a clear pattern to the BJP's appointments – whether in Prasar Bharati, or in educational and research institutions. This pattern goes beyond "Left vs Right" divides.

PREOCCUPATIONS

JAYATI GHOSH

The euro's short life has already been a very eventful one. When it was introduced on January 1, 1999 by 11 European nations as the currency of finance (even if not yet of daily use), the euro was celebrated as the crowning achievement of European economic and financial integration. Because it represented an economic bloc even larger than the United States, it was also seen to present a major threat to the U S dollar in international financial markets.

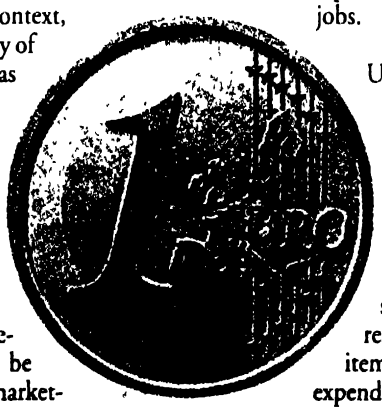
But the fledgling currency seems to have confounded its supporters by shrinking rather than growing, over the past year. In the 11 months of its existence, it has declined about 15 per cent against the dollar and more than 30 per cent against the Japanese yen. And on the closing day of trading in the first week of December, it actually fell below what many had seen as the important psychological barrier of 1:1 parity with the dollar.

As in so many movements in international currency markets, it is very hard to explain the euro's fall in the recent weeks with reference to the so-called "fundamentals". There is now clear evidence of accelerating growth in the hitherto sluggish European economies, and there has even been a recent increase in the benchmark interest rate set by the European Central Bank (ECB).

If despite this the euro has continued to fall, it has largely reflected what can broadly be called "unfriendly market sentiment". Hardly anyone really knows what forces determine this vague and frightening term, but at least this much is clear: private financial markets always react adversely to any talk of new taxation, or even the mildest of official statements regarding public intervention to save jobs or to meet other social criteria within any

Singing the euro blues

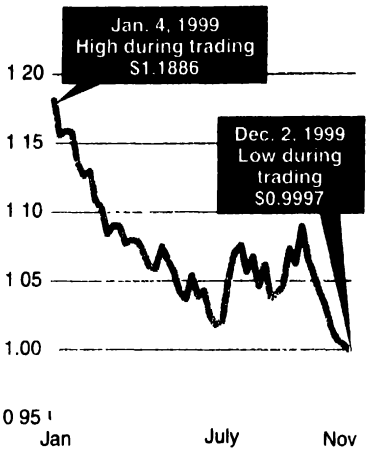
The European Union's currency continues its slide against the dollar, even as Europeans wonder whether the euro was worth all the effort.



country.

The governments of developing country "emerging markets" have long come to accept this unpalatable fact, and those governments that remain keen to keep foreign investors happy at all costs (such as in India) have come to be obsessively careful to avoid any remote possibility of new taxation or even increases in socially relevant government intervention. But now, even OECD (Organisation for Economic Cooperation and Development) governments have been forced to deal with the consequences of this pressure from international finance.

Thus, apparently the latest run on the euro has come about because private markets are unhappy with the "leftist" sentiments that have recently been expressed by several European leaders. The current anger of the market is directed against the German Chancellor, Gerhard Schroeder, who had earlier tried to present himself as the darling of international capital, in the process demolishing the domestic political support base of his own party.



Germany has been the sick economy of the European Union for some time now. It accounts for one-third of all euro-zone output, but in growth terms it has been lagging behind almost all its euro-zone neighbours, especially France. Even the German Government's council of economic advisers has predicted that Gross Domestic Product (GDP) growth next year will be only 2.7 per cent, after remaining at 1.4 per cent this year. Meanwhile, the eastern region continues to stagnate, and unemployment continues to increase.

In this uneasy context, even the slight recovery of the past few months has done little to dispel social disaffection within Germany which is now putting more pressure on the German Government. Two recent moves by Schroeder have therefore been such as to be classified as "market-unfriendly".

Falling euro

The plummeting euro dropped below the dollar for the first time ever on November 9. Here are the weekly closes for the euro since its introduction on January 4, 1999.

Source Compiled from AP research **AP**

FIRST, the German Chancellor decided to use state funds to bail out Philipp Holzmann, a troubled construction company which accounted for a large number of workers. This has been interpreted by international financiers, who have typically viewed continued unemployment more favourably than employment generation, as a sign that the German Government does not want to carry out major "reforms" of the labour market that would put many more people out of jobs.

Second, the European Union has been trying to agree on a cross-border withholding tax on savings which is obviously unpopular with private capital markets even though it is widely seen as necessary both to raise resources for important items of government social expenditure and to put some limits on volatile capital flows. Recently, Schroeder indicated that if the E.U. failed to reach an agreement on this, his government would consider imposing such a tax unilaterally anyway. This has created much angst among financiers (especially those in the City of London) who had been lobbying to stall the process at the E.U. level, and this is cited as the proximate cause of the euro's latest slide.

It is indeed ironical that Germany, which had been the chief champion of the euro from the early stages of the process, may find that it stands to lose the most from the loss of autonomy in national decision-making that monetary integration has involved. Germany has among the lowest rates of growth of GDP and the lowest rates of inflation in the euro-zone. This means that it also faces the highest real interest rates as a consequence of the uniform monetary policy. This in turn hampers growth further. Meanwhile, the U.S. dollar continues to soar, rising on a wave of confidence in the apparently endless U.S. boom. This creates a complex problem for Europeans.

WHATEVER may have been the public pronouncements to the contrary, there is no doubt that a large part of the earlier enthusiasm for the euro was based on the expectation that it would emerge as a major rival to the dollar and allow Europe some of the benefits of becoming finance's favourite destination. That expectation has so far been belied.

Meanwhile, any positive impetus to trade and import substitution that could come from the depreciation of the currency has been more than outweighed by the constraining role played by the E.U.'s stability and growth pact, which effectively prevents the use of fiscal stimulus to activate economic growth. As a result, the economic policymakers of the E.U., and especially of the largest country in it, Germany, now appear caught in a cleft stick of their own making.

They had subjugated their domestic interests at the altar of the common currency in the hope of being able to exploit the patterns of international capital flows, but it is now clear that they are still subject to the pressures of whimsical and demanding international financiers. And this means that they are even less able to meet the legitimate demands of their own citizenry. In the circumstances, it is not surprising that more and more Europeans are questioning the way in which the entire of monetary integration has unfolded so far. ■

A scholar remembered

M.N. Srinivas, 1916-1999.

PARVATHI MENON

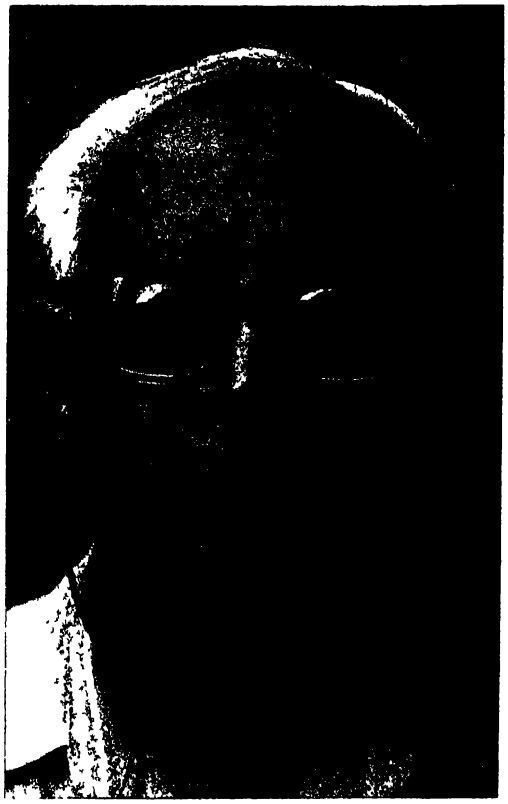
M.N. SRINIVAS, India's most distinguished sociologist and social anthropologist, died in Bangalore on November 30 from complications arising from a lung infection. He had turned 84 on November 16. While India has lost a keen observer and interpreter of contemporary social change, the city of Bangalore, where Srinivas and his wife Rukmini spent the last 27 years, will feel the loss of an ardent campaigner for the city's civic and environmental betterment. The genial visage of the internationally acclaimed scholar with his leonine shock of white hair had become a familiar sight for the residents of the city he was so involved with.

Srinivas' last public lecture, which he gave on October 7 at the National Institute of Advanced Studies, Bangalore, was titled "Obituary on Caste as a System". It may have appeared ironic to many that Srinivas, the first Indian sociologist to anticipate the persistence and longevity of caste in modern India, should, towards the end of his life, have written a requiem for that very system. Indeed, he did nothing of the sort in the lecture, its provocative title notwithstanding. His talk was an exploratory foray into the changing contours of caste, and on how emerging rural economies were transforming caste as a system. It is perhaps fitting that in what was to be his last talk, Srinivas should have returned to the theme that forms the *leit motif* of his scholarship spanning over five decades. His death cut short a line of enquiry pregnant with new insights on one of India's most complex social institutions.

The hallmark of Srinivas' scholarship was its accessibility and its firm roots in the Indian reality. He was among the earliest social anthropologists in India to break out of the confines of textual authority on which the discipline had till then rested. His social laboratory was the village, factory, classroom and home, where people lived, worked, and in general played out a multiplicity of social and cultural roles. "Srinivas' scholarship was not marked by high flights of theory," said T.N. Madan, a noted sociologist and Srinivas' friend for over three decades. "He had the rare gift of conveying insightful observations in simple language. The term 'vote bank', the notion of the 'dominant caste', or the concept of 'sanskritisation' have become part of common speech. His scholarship was remarkable for its accessibility."

Srinivas is perhaps best known for having coined and elaborated on the concept of "sanskritisation", the process by which castes placed lower in the caste hierarchy seek upward mobility by emulating the rituals and practices of the upper or dominant castes. He first propounded this theory in his book, Religion and Society Among the Coorgs of South India (1952). Written for his D.Phil degree at Oxford University, the book is an ethnographical study of the then little known Coorg community. It was a path-breaking study for several reasons. To begin with, it validated fieldwork as an essential methodology of the disciplines of sociology and social anthropology. Secondly, it offered a ground view that challenged the colonial notion of caste as static and unchanging. Through terms such as "sanskritisation", "dominant caste", "vertical (inter-caste) and horizontal (intra-caste) solidarities", Srinivas sought to capture the fluid and dynamic essence of caste as a social institution. Thirdly, it rejected the idea of a rigid, pan-Indian caste system, widely upheld in scholarship then. Instead his study asserted the importance of the regional dimensions of caste and the "little traditions" of Hinduism. At a time when an influential section of India's intelligentsia optimistically believed that caste would disintegrate under the march of modernisation, it was both prescient and brave of Srinivas to have argued to the contrary. Caste, he firmly believed, would continue to find expression in the public and private lives of Indians. Srinivas, however, never supported caste-based reservation as a programme to alter unequal caste equations.

The Remembered Village (1976), a socio-anthropological study done in 1948 of the village of Rampura near Mysore, remains Srinivas' finest monograph, one that he considered his best. It was this book that won him international recognition and established his scholarly reputation. How Srinivas lost his precious Rampura field notes in a fire at Stanford University and reconstructed the book from memory has become part of sociological lore. This tragedy later brought its own rewards. Friends and colleagues of Srinivas agree that the insights, readability and novel-like sensibilities of this outstanding work of ethnography derived from the quality of recall that Srinivas put to effective use in writing it. (This was not Srinivas' last encounter with fire, nor indeed with being called upon to "remember". In 1972, while shifting from New Delhi to Bangalore, the container which carried a large number of his books and papers caught fire as it was being transported by train. And then, in December 1998, he gave an extensive interview to anthropologist Chris Fuller for the journal *Anthropology Today*. Fuller lost the recording a day later when his suitcase was stolen from a train. Fuller notes that "with great sympathy and patience", Srinivas agreed to redo the whole interview a few days later.)



MYSORE NARASIMHACHAR SRINIVAS was born on November 16, 1916 in Mysore, although his parents were from Arakere, a village 20 miles (32 km) away. Srinivas, the youngest of four sons, studied in Mysore. He took an honours degree in social philosophy from Mysore University, "an ambitious programme, covering an immense variety of subjects, which would have daunted any undergraduate anywhere" he recalled in his interview to Fuller. Srinivas has written about how, as an "overprotected Brahmin boy", he experienced his first "culture shocks not more than fifty yards from the back wall of our house... The entire culture of Bandikere was visibly and olfactorily different from that of College Road. Bandikere was my Trobriand Islands, my Nuerland, my Navaho country and what have you. In retrospect, it is not surprising that I became an anthropologist, an anthropologist all of whose

eldwork was in his own country."

From Mysore, Srinivas moved to Bombay and later to Oxford University. He did his Masters under G.S. Ghurye, during which he did a dissertation he later published as *Marriage and Family in Mysore* (1942). Srinivas would later recall that the seeds for his ideas on sanskritisation were sown during his fieldwork for his M.A. dissertation. At Oxford, Srinivas worked under the two leading anthropologists of the day, A.R. Radcliffe-Brown and E.E Evans-Pritchard. In his interview to Fuller, Srinivas speaks of this period as one of both intellectual excitement and growth.

Srinivas returned to India in 1951, and joined the Department of Sociology of M.S. University, Baroda. He formulated a new syllabus for the department and built it into a reputed centre of socio-anthropological teaching and research. In February 1959, he was invited to Delhi University to establish and head the Department of Sociology at the Delhi School of Economics, which was recognised as a centre for advanced study in 1968. Srinivas attracted the best talent to the department and built it into one of the leading departments in the country in the field, combining sociology with social anthropological approaches. Its competitor at the Delhi School was the Economics Department which had an array of distinguished economists such as K.N. Raj, Amartya Sen, Pranab Bardhan, Mrinal Dutta Chaudhuri and others on its faculty. In his interview to Fuller, Srinivas hints at the competition and tension between these two strong departments. "Marxism was the dominant ideology of the economists – Marxism and macro-economics. They laughed at the kind of things we were doing. We were studying kinship, caste, villages, religion, and they looked upon us as backward people," Srinivas told Fuller.

In 1972, Srinivas returned to his home State and joined the Institute for Social and Economic Change set up by V.K.R.V. Rao in Bangalore as Joint Director, a position he gave up in 1979. He joined the National Institute of Advanced Study (NIAS) as the J.R.D. Tata Visiting Professor in 1992 and started a unit of sociology and social anthropology in 1997. He and R.L. Kapur set up the Women's Policy, Research and Advocacy Unit at the NIAS. His interest in issues relating to gender began with his participation in the Status of Women in India Report, 1975.

T.A. HAFEEZ

After shifting to Bangalore, Srinivas continued to write on those themes that flowed from his early anthropological work – caste, modernisation, sanskritisation, social change, gender, the practice of social anthropology, and so on. His most recent publication, *Indian Society through Personal Writings* (1998), dedicated to his old friend, novelist R.K. Narayan, is a collection of essays – some biographical, some on caste disputes in Rampura, an account ("idiosyncratic, if not capricious") of Bangalore, and so on. Interestingly, in the book *Village, Caste, Gender and Method* (1998), he also included two short stories.

Srinivas had for some time been working on his autobiography. He believed that an autobiography could become a productive tool of sociological research. He wrote in a recent book about how and why sociologists in India have not tried to use their own lives as ethnographical data for analysis. "It is my plea," he wrote, "that the movement from studying one's own culture or a niche in it, to studying oneself as an ethnographic field, is a natural one... Sociology of the Self should be a rich field, given the diversities and unities which the members of Indian civilisation are heirs to."

As a commentator on current trends in Indian society, Srinivas was surprisingly reticent on the impact of the growth of Hindu fundamentalism in recent years. T.N. Madan, however, says that Srinivas was, in fact, "deeply worried about the political link between religion and politics, between the mindless use of religion by Hindu communalists and its equally mindless rejection by the secularists." All of this he felt had led to the "decline in the serious study of religion". Srinivas had been involved in coordinating an international seminar on religion to be held in September 2000 at the NIAS. According to Madan, he was also critical of sections of the English press for allowing their anti-Bharatiya Janata Party sentiments to often turn into a sweeping anti-Hindu position.

Yet Srinivas was remarkably outspoken in his defence of the Indian media from the pressures of globalisation. He participated in the public debate on the entry of the foreign media into India with a forceful plea that it be kept out. He did not oppose this on the narrow grounds of "westernisation", but on the grounds that it would compromise and distort the independent news agenda of the Indian press. He became increasingly interested in issues relating to Information Technology and had helped draft the Bangalore Declaration during IT.Com, 1998, held in Bangalore.

Srinivas and his wife Rukmini, a geographer teaching at the Aditi Mallya International School in Bangalore, have had a large circle of friends, students and colleagues. Their two daughters, Lakshmi and Tulasi, live in the United States. Lakshmi has a Ph.D in Sociology from the University of California at Los Angeles (UCLA) and is now on its faculty. Tulasi is doing her doctorate in Anthropology at Boston University.

H.Y. Sharada Prasad and R.K. Narayan count as two of Srinivas' oldest friends. Talking to *Frontline* from New Delhi, Sharada Prasad recalled several of Srinivas' personal qualities. "He had a tremendous range of interests," he said. "He was a keen observer of individuals, their lives, thought processes, stories and problems. It was so easy to converse with him. There was no pedantry or boast in him... amazing for a scholar of his international standing." Chuckling at the memory of their last meeting at NIAS a few months ago, Sharada Prasad said of his friend, "Everything was so unstructured about him. He did not stand on a pedestal and say 'Behold, here I am'." ■

The self as institution

A.R. VASAVI

HE gave the academic world the terms "vote bank", "dominant caste" and "sanskritisation". And they became part of our common lexicon – terms used in everyday speech and popular writing. It was this, his astute understanding of the everyday life of the nation and his ability to render academic jargon into common parlance, that gave Professor M.N. Srinivas the stature of a people's sociologist.

Eschewing the purely abstract and theoretical study of India's cultures and societies, he charted a new terrain in which intensive fieldwork became the central methodology, and the representation of the lives of people in accessible writing the key responsibility of researchers.

In his personality was blended the culture of three different places, namely, princely Mysore where he was born and studied till his Masters, nationalist Bombay where he received his doctorate, and Oxford where he came under the influence of anthropologists A.R. Radcliffe-Brown and E.E. Evans-Pritchard. But as he often wrote and said, he also carried with him the sensitivities and sensibilities learnt in Rampura, the other 'university' about which he wrote in the now classic monograph, *The Remembered Village*. He considered himself privileged to have known and won the affection of village residents, and regretted that he had not had the time to write more about them. Although he was popularly known as an authority on caste and its multiple *avatars*, Professor Srinivas was also concerned with rural India and its myriad problems. He often wished that he had had the time to write a more definitive essay on India's peasants, which he wanted to call the "Moral Universe of the Indian Peasantry".

Of the departments and the institution he helped establish and built – the Department of Sociology, M.S. University, Baroda ; the Department of Sociology, Delhi University; the Institute for Social and Economic Change, Bangalore; and the Sociology and Social Anthropology Unit at the National Institute of Advanced Studies (NIAS) – he was most proud of the Sociology Department at Delhi University. He would speak of its faculty as a proud father would of his children, keeping himself updated on its courses and publications, and taking immense pride in it becoming one of the best Sociology departments in the world. His institution-building capabilities drew on a sense of purpose, perseverance and foresight. He also had the skills, indispensable for institution- builders in India, to negotiate the fault lines of status, power, ego and personal idiosyncrasy.

He was not only a student and scholar of Indian society and its complexities, but was also an adviser who counselled many, including this writer, about ways to make sense of our personal lives in a society in which family, gender, kinship, caste and class often took pernicious and punitive social forms. He vociferously objected to purely negative portrayals and representations of India, and firmly believed that the nation had several achievements to its credit, and that with time, would overcome its many vexing problems – of poverty, caste, gender bias and so on. He objected to the very idea of a caste census, which the present Government plans to conduct in 2001, believing that the complexities of *jatis* and sub-*jatis* could never be authentically recorded.

We often discussed and argued about the state of academia in the country. An issue of recurring concern was about ossified institutions invoking outdated rules to exclude talented scholars, while patronising mediocrity. He himself was a stickler for institutional regularity and academic standards and was most intolerant of anything he considered lax. He was alarmed at the dismal quality of certain types of foreign funded social research, and at a recent symposium organised by an international development agency, he publicly chastised the researchers for oversimplifying and even caricaturing the lives of village residents.

Although vigilant about keeping pace with recent anthropological literature, he tended to dismiss trendy, theoretical work as "academic mantra-tantra". He once took me to task on my paper written for an in-house seminar on "Theory in Anthropology", as he was offended at my criticism of cultural particularism. Sometimes, such differences made for strained relations, but he would relent after a few days and make amends by offering me a piece of *mysore pak*, some *sonepapdi* or even a "mint-with-a-hole"! He did not always take academic suggestions easily. For me it seems both ironic and sad that after a heated discussion we had about his last public lecture on "Obituary for Caste as a System", he conceded to my suggestion that Dr. B.R. Ambedkar's writings had substantial academic and anthropological worth.

The list of what he wanted to write and do was long. But what he discussed the most and looked forward to eagerly was completing his autobiography. This, he joked, he would auction to the highest bidding publisher, just as celebrity novelists did these days! I now think that he would have wanted this, a likely magnum opus, to be dedicated to "Rukka", his wife Rukmini. Theirs was a special relationship of camaraderie, support and understanding. He also wanted the autobiography to be read as a text as he considered the study of the self to have sociological validity. Indeed, in his case, he developed the self as an institution, adhering strictly to what he believed to be norms of correct social conduct, interaction and protocol. His daughter Lakshmi believes that for him work was the most meaningful part of his life. Yet, MNS, as he was known, was a person of many interests and passions. He delighted in the small and beautiful things of life – the shrikes and bulbuls that visited their garden, the fish in the lotus pond, the new fruits and nuts available in the market, fancy stationery, and details of the latest films in town.

Professor Srinivas' last working day, November 10, at the NIAS, was both typical and special. He arrived later than his usual and very punctual 9.10 a.m. and took several people to task for the office car having been sent late. Although he looked tired, he addressed a workshop on "Socio-Anthropological Approaches to Educational Research" and delivered an impromptu and passionate lecture on the need to see education not only as an important issue but as an issue vital to the nation's progress. At tea-break, he was all charm to the participants, asking each of them about their home State and responding with an anthropological observation on each region. As he prepared to leave, he shook hands with every participant. Back at home around 4 p.m., he had a cup of tea and then donned the cap of the concerned public citizen. He rode in the Bangalore City Corporation's jeep, indicating to the ward officer the many areas that required cleaning, clearing or redoing.

Twenty days later, Professor Srinivas was ready for a different anthropological journey. On November 30, for this, his last field trip, his daughter Tulasi thoughtfully placed his favourite items beside him – a copy of *The Remembered Village*, his reading glasses, and a pen. ■

A.R. Vasavi is a Fellow at the National Institute of Advanced Studies in the Sociology and Social Anthropology Unit.

CHAMU

"So one of my last (long-time) friends has gone," noted R.K. Narayan, 93, on being informed of the passing of M.N. Srinivas, 83, a friend of six decades and more. The writer counted him, on the fingers of one hand, among "my constant friends," people who, for him, never changed in their qualities, their attitudes, and their closeness. Ten days before his death, brought on by pneumonia, in Bangalore, the pioneering social anthropologist had visited the great novelist in Chennai. "He looked well and spent quite a bit of time chatting with me," said Narayan, adding: "He had evidently come to say his farewell."

Srinivas – "Chamu" to his friends – was an important figure in Narayan's life as a writer. He was, as Narayan notes in *My Dateless Diary*, "the first reader of my first book" (*Swami and Friends*, in typescript) and "a critic and adviser on many unwritten ones."

In October 1956, Narayan made his first serious foray beyond the "triangular boundary" of Mysore, Coimbatore and Madras – a visit to the United States, lasting nearly nine months, at the invitation of the Rockefeller Foundation. This coincided with an extended academic stay in the United States of Professor Srinivas and his wife.

We reproduce here excerpts from *My Dateless Diary: An American Journey* (published in 1960). Narayan's diary entries relating to 1956-57 convey the flavour of a remarkable friendship that originated in Mysore of the 1930s:

Chicago

BETWEEN Singer, Redfield, and Shils, eminent Professors whose knowledge of India was profound and who had each spent at least a year in different parts of India, my stay in Chicago was most rewarding Between them they unobtrusively took care of my food, shelter, and movements

On the morning of my arrival while talking to Redfield in his room, Milton Singer came in to say that Chamu was arriving from New York next day Let no one be puzzled about the identity of Chamu He is Dr M N Srinivas, an eminent Indian sociologist of Oxford, Baroda, Bombay, Manchester and Delhi, who was a great friend and neighbour of mine in Mysore

Years ago when I wrote my first novel *Swami and Friends*, and found none to read it, a very young college fellow came forward to go through the manuscript he read and certified it as readable, which was very encouraging That was Chamu He was then a college student, now he is a senior, respected professor – many academic activities and distinctions having come his way His research and studies constantly took him out of view, if not to another corner of the world at least to another part of the country

However I always had an annual glimpse of him, when he came down for a couple of weeks each year to see his mother and brothers in Mysore Our literary contact started years ago with *Swami* continued. He always goaded me on to write my next and not to waste my time, whenever I saw him I discussed with him the subject I had in mind for a new novel, and through his reaction I always got an objective view of anything I might plan to write. So he continued, through years, to be not only the first reader of my first book, but also a critic and adviser on many unwritten ones

Now I was happy to know that I should be seeing him next day, not only because I longed to speak Tamil to someone but I also hoped he would be able to give me a small quantity of betel-nut to which I am addicted I had exhausted my own stock of it weeks ago, above all I wanted to speak to him about my new book and the problems connected with it

* * *

Overload

When I reached Chamu's room in the hotel, his wife, Rukka cried through the bathroom door, "So you have come! Don't go away I must talk to you ' I liked the mystery and menace of her tone The moment she was ready to meet me she said with considerable warmth, "Did you want to work off a grudge against us by mentioning our name to Mr – of Mysore before leaving? A nice situation you created for us after you left!"

I understood what she meant On the eve of my leaving Mysore, with a dozen things to do by way of getting my papers and baggage in order, a man locally employed in a scientific institution clamoured to meet me although I repeatedly sent word that I was too busy He said he wanted only a few minutes with me, that he would very much like to say goodbye to his favourite author

No author is so hardened that he cannot be won by such an approach, and so I found for him a quarter of an hour on the day of my departure I settled him in my study, offered him a cup of coffee as usual, and he told me for exactly the space of five minutes how much he admired my Sunday *Hindu* articles (which anyone may talk about even without reading), and then mentioned his real business with me. He had his daughter and son-in-law studying in a University in New York State, he wanted me to carry a hamper of condiment, chilli powder and spices for them He assured me that the whole thing could not weigh more than a pound, but I excused myself all the same, being an air passenger, explaining that if I had space for another pound I should probably take a woollen sweater or some such thing He looked as if I had refused to carry some life-saving drug to one in dire need And so I said (this is where Chamu comes into the story)

'If it is so urgent why not try and send it through Dr M N Srinivas who is coming to the States by boat?"

The man brightened up immediately and said, Oh, I know that family so well His brother was my classmate His aunt was – was good to us when we were in Kolar, his cousin has married my nephew, and so on and so forth He found so many approaches to Srinivas that I felt at the rate of a pound per kinship, he could ask Srinivas to carry a whole shipload of sweets and spices The next part of the story is best presented through Chamu

"That man got at me through my brother with whom he renewed his acquaintance He had been a cricket player once upon a time and you know how my brother melts at the sight of an old cricketer I told him to send his package along next day

"Next day, when I returned home at night I found the passage of our home choking with a wooden chest, the sort of

Excerpted from R. K. Narayan, My Dateless Diary: An American Journey, *1964, India Thought Publications; Mysore, Penguin Books India, 1988.*

thing the thirteen pirates sat on, a burlap sack, apparently filled with coconut, a smaller trunk containing sweets judging from the swarm of ants, a basket containing possibly brinjals and cucumbers, and three more nondescript bundles. I had come home at midnight from a farewell dinner, and the sight of this luggage upset me.

"I summoned the man next morning and lectured to him and said that unless he reduced the bulk of his gift to his son-in-law by seventy per cent I would leave it behind. He again started off on how his cousin was married to our nephew, how devoted he was to my cricket-loving brother, how he had watched my Oxford career with pride and satisfaction but I was adamant. He had to take them away.

"Later in the day they were ready in the passage again, for me. All that he had done was to substitute a steel trunk for the old pirate's chest, the other articles remained unchanged. It was too late to do anything about it now. You may imagine our plight as we lugged all this around, the trouble we had at Bangalore, Bombay, Southampton, London, Manchester, every port, custom, and railway station, porter's tips, vigilance, counting and recounting, in addition to the problem of our own baggage.

"This trip was completely ruined for us thanks to your introduction, and by the time we arrived at the New York port our patience was at an end; just when we were hoping to be rid of the whole thing we found that the man's son-in-law had not arrived to collect his baggage as promised. The port was in the throes of a dock strike. I had to spend eight hours trying to get help to move the goods to my hotel.

"Finally I had to dump them in the hotel corridor because they were too unwiedly and large for any normal check room. I wrote to his son-in-law, telegraphed, and finally called him on the telephone, because I was leaving New York but still none turned up, I waited as long as I could and finally left the goods just in the hotel corridor and came away. I don't know or care what happened to them... I have only to thank you for all this travail."

* * *

Westward bound

On the (rail) road to San Francisco, with Chamu and his wife in another compartment, four doors off. Life in train for the next [redacted] hours. Food in the train, bath in the train, and neighbourly visits to and from Chamu, with many occasions to narrate my new story, and discuss it with him. It is so comfortable that I enjoy having an illusion of being a permanent dweller here, and so arrange my little possessions around on that basis. Find a comradeship with all and sundry, – including the very fat, crew-cut, teen-ager, always tottering with drink. He is a nuisance, as he pushes the door of every compartment in the corridor and peeps in, much to the consternation of Mrs. Chamu.

Our life is punctuated by movements to and from the dining car at various intervals – pushing and pulling the heavy doors all along the vestibule. Our biceps are greatly strained. Chamu and I have divided the labour, each doing it one-way. We march along as everyone in the lounge stares at Rukka's colourful sari, with open-mouthed wonder. We notice, however, a red-haired girl and two others being exceptions, who never look up, maintaining a concentrated gaze on their beer-glass all day. The steward is proud of being able to give us rice and buttermilk, and watches over us, as Rukka produces from her handbag South Indian condiments and spice-powder to help us through our meals. We form such a close community (although lasting only forty hours) that even the drunken teen-ager begins to say, "Good morning," "How do you do?" and "Excuse me," every time we pass.

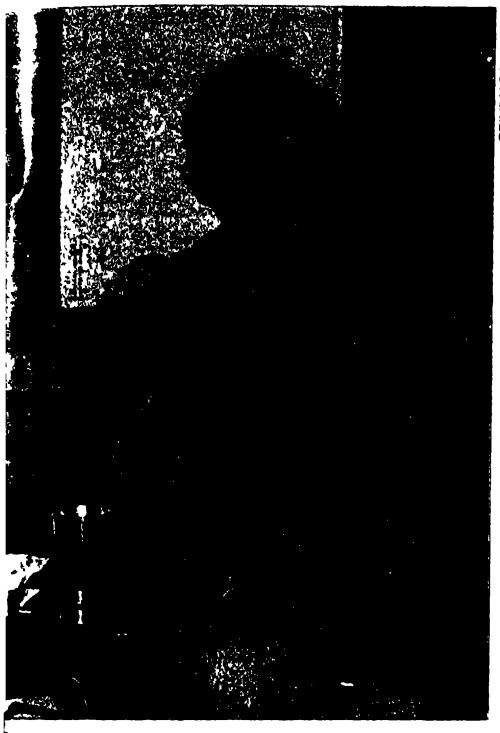
I plan to do some writing but the hours pass unnoticed.

* * *

Berkeley

Tuesday. Arrive Berkeley. We decide to get down here rather than go up to San Francisco. We climb down by means of a step-ladder. Professor David Mandlebaum and his wife are there to receive Chamu and wife and take us to a hotel. I have a feeling of being an intruder, the real expected guest being Chamu. I have got down here because Chamu is here, otherwise I should have gone to San Francisco and then on to Palo Alto which was really my original destination. But I never get there.

I think Chamu is the luckiest house-hunter in the world. Over lunch at Mandlebaum's he was suggested a house at Albany, a suburb of Berkeley. After lunch David went upstairs to his study and Ruth drove us to Albany. 1050, Peralta Avenue (the name attracted us). This was practically to be my second home in Berkeley for the next two months. Rukka saw the house, liked it, Chamu endorsed her view even without looking at the house, on hearsay, and there they were ready to move in as soon as the lady of the house who had recently lost her husband and was going to live with her daughter in New York was able to move her things out. I never saw anyone make such a quick decision about a house.



Chamu is a philosopher and a logician, a man who can specify what he wants. I sometimes envy him his clear-headedness and luck. What a contrast to my own management of my affairs.

* * *

Sunday Excursion

Half the Sunday spent in finding my way to Chamu's house at Peralta Avenue in Albany. In this process came across a number of places with picturesque names, such as Euclid, Scenic, Cedar, Spruce, Sonoma, Pomona, Carmel. Felt tired. Finally managed to reach Albany. Mrs. Chamu was good enough to keep rice and curry and curd for me. Evening John came down to take me for the Diwali celebrations at the International House. I resisted going there at first – afraid of the air of fraternity. But yielded for want of a better occupation... The air was so heavily, deliberately Indian that I felt oppressed and persuaded John to come out...

At the book store John met a friend – a Dr. Schurman, an expert in Chinese, Japanese, Arabic, who proposed that we

SRINIVASA MURTHY

R.K. Narayan and M.N. Srinivas in Chennai, mid-November 1999: "constant friends" over six decades and more.

adjourn for a drink somewhere. He drove downtown in search of 'Lemon and Cat' or some such well-known 'quiet' pub It was as usual dim-lit, 'atmosphere-ridden', but so full that we had to get out again and search for another place; finally he drove us to his flat, where he could provide us fruit juice and beer. I was impressed with this man's knowledge of Eastern languages. For light reading he read Chinese literature in the original, and Greek and Hebrew when he wanted to bite into harder stuff. Being a woeful failure at learning languages, not knowing any except Tamil and English, I was definitely impressed and wanted to proclaim that he should be the grand moderator in the Tower of Babel. We dispersed at midnight.

Picked up by John at noon, and then on to Chamu's for a South Indian lunch. Chamu, the saviour! After lunch, John drives us over the Berkeley Hills, Tilden National Park, Grizzly Peak, and Redwood forests, till sun-set – all through wonderful mountain scenery.

I was getting obsessed with the thought that I was not putting my camera to good use. So brought it out today and exposed a few rolls – delicately framing each picture around huge elms and redwood, and with Chamu, wife, and John in each spot. I took so much time to compose each picture that the others became impatient. I begged them to stand still. But unfortunately I forgot to readjust the shutter from where John has set it for time exposure under the Golden Gate Bridge the other evening, and so no one turned up in a recognisable shape when the films were later developed; thus lost a chance of immortalising the magnificence of the scenery and company that we enjoyed that afternoon.

End of a guest

Another day of house-hunting, having firmly decided to stay in Berkeley rather than at Palo Alto in order to write my novel... My preference is for Albany because of Chamu's proximity...

While browsing around the campus bookstore I suddenly look up and notice Hotel Carlton staring me in the face, never having noticed its presence before. Walk in and find Kaplan, the manager, extremely courteous and full of helpful suggestions – he's willing to give me a room where I may use a hot plate for cooking my food, daily room service, separate bed and study, ideal in every way, the perfect hotel for me. And it costs seventy-five dollars a month...

For the first time a settled place where I don't have to keep my possessions in a state of semi-pack. I am able to plan my work better. I am enchanted with the place, everything is nearby, two cinemas, three or four groceries, and any number of other shops, I can walk down and buy whatever I may need and peep at the Campanille clock to see the time, its chime is enchanting.

A Party

After dinner picked up by John to join a party on the Hills at Ed Harper's...

I looked about and saw Chamu engaged in an earnest conversation with a young professor, in the quiet seclusion of the fire-place. I approached them with a feeling of relief at finding someone to talk to; but they stood with their backs to the assembly and were engrossed in their own talk. I overheard Chamu say, "Tell me, do the Australian Aborigines correlate copulation with population?" I asked Chamu later why he should bother about the question. He said, "Oh, anything to keep his mind engaged. Otherwise, he would have bothered me to explain the caste-system in India."

Writing *The Guide*

Nothing much to record, the same routine, I have got into the routine of writing – about one thousand five hundred to two thousand words a day anyhow. I have the whole picture ready in my mind, except some detail here and there and the only question is to put it in type. Some days when I feel I have been wasting my time, I save my conscience by telling Kaplan at the desk, "I am going to be very busy for the next few weeks trying to get on with my book." A restatement of purpose is very helpful under these circumstances.

Graham Greene liked the story when I narrated it to him in London. While I was hesitating whether to leave my hero alive or dead at the end of the story Graham was definite that he should die. So I have on my hands the life of a man condemned to death before he is born and I have to plan my narrative to lead to it. This becomes a major obsession with me. I think of elaborate calculations: a thousand words a day and by February first I should complete the first draft. In order to facilitate my work I take a typewriter on hire, after three days of tapping away it gets on my nerves, and I lounge on the sofa and write with my pen. Whatever the method my mind has no peace unless I have written at the end of the day nearly 2,000 words. Between breakfast and lunch I manage five hundred words, and while the rice on the stove is cooking a couple of hundreds and after lunch once again till six, with interruptions to read letters and reply to them, or to go out for a walk along the mountain path, or meet and talk to a friend.

Telephone from Chamu to say that his neighbour, an elderly man, who often used to invite him to watch television died suddenly of a heart-attack while shaving in the morning. Chamu and his wife terribly shaken. In the United States death sounds unreal. The man had said "How do you do?" from the road as I was waiting for Chamu to open the door on the previous evening. Chamu's landlord had also died similarly three months ago. So a feeling of insecurity about Peralta Avenue itself...

Having written the last sentence of my novel I plan to idle around Berkeley for a week and then leave on my onward journey. I have lived under the illusion that I would never have to leave Berkeley. Berkeley days were days of writing, thinking, and walking along mountain paths, and meeting friends. And so, when the time comes for me to plan to leave, I feel sad.

Orissa

The picture feature on Orissa ("After the storm," December 10) depicted the tragedy better than any number of words could.

A.D. More

Nashik

★ ★ ★

My heart goes out to the victims of the 'super cyclone' in Orissa ("Killer cyclone," November 26). We must appreciate the Army and the Air Force for having played a leading role in the relief work.

It is rather unfortunate that a tragedy of such magnitude has been politicised. The BJP president's statement criticising the Congress government's "inefficiency" in tackling the situation appears to be politically motivated. We have to respond to the situation as one nation. Also, it should be declared a national calamity.

Onkar Chopra

New Delhi

AIDS

In the Special Feature on AIDS prevention and control (December 10), the articles and the interview with Dr. P. Krishnamurthy, Project Director, AIDS Prevention and Control Project, were informative and educative. In this context, it is to be noted that when there is no known cure for AIDS in the allopathy system, alternative medicine does have a positive answer.

K. Ramadoss

Chennai

E-governance

Implementing the concept of e-governance without a proper infrastructure is like putting the cart before the horse ("Towards e-governance," December 10). For instance, often the telephone lines are so bad that even a simple e-mail cannot be transmitted or received in one attempt. The service providers of e-mail and the Internet have still a long way to go before they can offer quality service consistently. Another neglected area is the training of computer operators.

The people want quick redress of their grievances. How does e-governance change the situation if we continue with the same old systems and bureaucratic practices? We should not go overboard in introducing e-governance, which will be a drain on our resources. Instead, the concept should be introduced gradually and effectively.

D.B.N. Murthy

Bangalore

Bofors

It is clear that former Prime Minister Rajiv Gandhi had a hand in the Bofors scandal ("Know Your Bofors", November 26). The whole country is waiting to know who the culprits are. If the truth comes out, the credit must go to the CBI and the press.

S. Thamizhselvan

Karuppampulam, Tamil Nadu

Reservations

The findings of the committee set up by the Tamil Nadu Government ("Denial of rights," November 26) should serve as an eye-opener to all those entrusted with the task of implementing the reservations system for the Scheduled Castes and Scheduled Tribes. The committee's report confirms the fact that the benefit of reservations does not reach these sections as per the legal provisions. It also negates the government's line of thinking that reservations alone can put an end to the social discrimination and exploitation of the S.Cs and S.Ts. There is need to set up a national-level commission to go into the issue.

Sanjai Kumar

Hazaribagh, Bihar

Saffron education

The tactics of Human Resource Development Minister Murli Manohar Joshi of packing important academic institutions with RSS men ("Agendas and appointments," November 26) must be a matter of concern to all those who take pride in calling ours a pluralistic tradition.

The basic aim of the BJP-led Government in this game is to rewrite history in its own perspective and present it as the real thing to the younger generation. The BJP has already done this in Uttar Pradesh and Rajasthan. As many as 13,000 Vidya Bharti schools, controlled by the RSS, inculcate "Bharatiya culture" in the youth.

The NCERT, which used to evaluate textbooks and which had once criticised the Vidya Bharti's choice of books for their 'communal approach', is now headed by a member of the Sangh Parivar. I request Murli Manohar Joshi not to steal from children their innocence and open-mindedness which alone will help them make India great in the 21st century.

Ahmad Ali

Unsar, Uttar Pradesh

The Pope in India

The Pope made it clear that his goal is the evangelisation of Asia. This was stated in the document "Ecclesia in Asia", issued during his visit. However, your report ("The Pope in India" November 26) ignores this and, instead, calls such "interpretation" of his visit (as if an interpretation was needed) mischievous. I think that even the Vatican would have trouble agreeing with the writer's innovative spin.

Prashant Rao

Michigan, U.S.

★ ★ ★

It is not as if only Asia needs a large infusion of evangalisation as exhorted by the Pope. In the United States, attendance in the churches of various denominations is rapidly declining and some of them have even closed down. This has alarmed philanthropic Christian institutions such as the Arthur DeMoss Foundation, which has spent about $25 million in the past one year distributing booklets free of cost to people living in a country which is basically Christian.

Most organised religions are on the decline in many parts of the world as religion is becoming increasingly personal and non-denominational. The Pope has done his job exceedingly well, for which he is widely admired.

Kangayam R. Rangaswamy

North Carolina, U.S.

★ ★ ★

It is time the right to convert to any faith, an inalienable right under the Constitution, is debated in our secular nation. If conversion was a taboo right from the beginning of human evolution, religions would not have evolved and we all would be only practising animism. Religion has evolved for the better. As a result, civilisation has progressed more in certain parts of the world than others. India has evolved now into a semi-modern society because of education. Like Europe, it will one day evolve into a modern society whose religious values will naturally undergo a change for the better – a superior religion and a superior civilisation. If Hinduism does not evolve to meet

is social and spiritual progress, it will turally become obsolete like many ropean cults of yesteryear.

R. K. Anand

Mysore

Christian population

The article "A numbers game" (December 10) sheds light on the issue of religious conversions.

In an effort to implement its "hidden agenda", the Sangh Parivar, with the support of a section of the media, seeks to distort history and facts. The graphics showing the decadal growth in population establishes the fact that the hue and cry over conversions is but much ado about nothing. In a context in which Prime Minister Atal Behari Vajpayee himself called for a national debate on conversions, the figures provided in the article should be an eye-opener to everyone.

Justin Jayaraj

Kozhikode, Kerala

Nyerere

Julius Nyerere ("A socialist and a visionary," November 19) believed in world peace, African unity and the welfare of the underdog. One of his great accomplishments was to have kept Tanzania united under one-party rule with no internal strifes. The country achieved more than 80 per cent literacy. And with aid from Scandinavian countries he completed a number of power and water supply schemes, besides establishing a rail link to the Zambian copper belt in record time with China's help. The employment of Indian, Canadian and European teachers enabled the country to impart modern education at the school and university level.

A high level of economic development was offset by a costly war with Idi Amin, rehabilitation of refugees from Rwanda and military help to southern neighbours like Angola and Mozambique. The new capital project was also one, with a high cost. Revenue collection was poor in all the nationalised properties.

Nyerere's personal integrity was remarkable. As a President, he stayed in a small cottage by the side of the presidential palace, rather than in the palace itself.

B. Ramachandran

Chennai

Diesel prices

The government is grappling with the problem of deficit in the oil pool account. Tinkering with the price of kerosene would hit the poor directly, while increasing the price of petrol and diesel would fuel inflation, again affecting the poor besides the affluent. The one product where the price hike will not hit the poor is LPG. Your story ("The burden of diesel price," November 19) says that the demand for LPG is likely to touch 7.9 million tonnes by 2002. This works out to some 411 million household cylinders. The subsidy for LPG is a whopping Rs. 140 a cylinder. If this subsidy is totally withdrawn, the savings will amount to Rs. 57.5 billions (Rs. 5,750 crores). This is the most humane solution that will leave the poor unscathed and help contain inflation. LPG users, who generally belong to a higher economic stratum, will be able take this hike in their stride.

As for the adulteration with subsidised kerosene of other petroproducts by unscrupulous dealers, petrochemical engineers should think of some distinct colouring agent or flavour that would enable even untrained people to detect adulteration.

R. Rajaraman

Chennai

Narmada

M.U. Purohit, Consulting Engineer, Sardar Sarovar Project, has criticised H.M. Desarda and "those who campaign against the so-called unsustainable development of natural resources", whom he patronisingly calls well-meaning activists ("Of development and deprivation," November 19).

Purohit accuses Arundhati Roy of exaggerating the number of victims of large dam projects. Surjit Bhalla, he says, has 'proved' that dams have displaced only five to eight million people in India. The Sardar Sarovar Project itself will take the land of at least 3.2 lakh people, many of them tribal people. It would help Purohit if he reads the report of the Morse Commission of the World Bank, whose study of the rehabilitation problem and the dam's disastrous effects is more thorough and independent than that the three State governments concerned have ever attempted.

The government's land-for-land rehabilitation programme has been deceitful. The people of Gadher, for example, were taken to a prospective site for resettlement. The land they saw was flat. It had water nearby, the soil was rich, banana trees grew all around. The government assured them that it would build a school and a health centre, lay roads and provide electricity and water. The people signed on the dotted line. But when the day came to move, they were taken to a different site, an expanse of wasteland, with no water source. And, of course, no health centre, no school.

Secondly, the projected costs and benefits of the dam had been fudged. Even the water potential was heavily exaggerated. World Bank experts reported that the project would be able to deliver only half as much irrigation water as had been stated, and that the dam would silt up twice as fast as was being assumed. The costs projected ignore the rise in salinity in the river's lower reaches, destroying one of India's most lucrative fishing grounds. The World Bank also reported a rise in the incidence of malaria. The project was "taking malaria to the doorsteps of the villagers", it said.

Shockingly, Purohit asserts: "All the affected families need not necessarily be displaced. In fact, of the 33,014 affected families in Madhya Pradesh, 18,890 have opted to stay on as they will only be temporarily affected by flood backwaters. They need to be only temporarily shifted to nearby higher ground when such floods occur." In her 1996 book *Masters of Illusion*, Catherine Caulfield writes: "The progress of such schemes as Sardar Sarovar is entirely rational in view of the opportunities they present for their backers to enrich themselves at the public's expense... Engineers and bureaucrats can look forward to kickbacks from those whose land they overvalue for compensation purposes or purchase at inflated prices to resell to oustees, as well as from contractors who increase their profit margins by using shoddy materials or simply not doing the work at all."

J.B. D'Souza

Mumbai

America

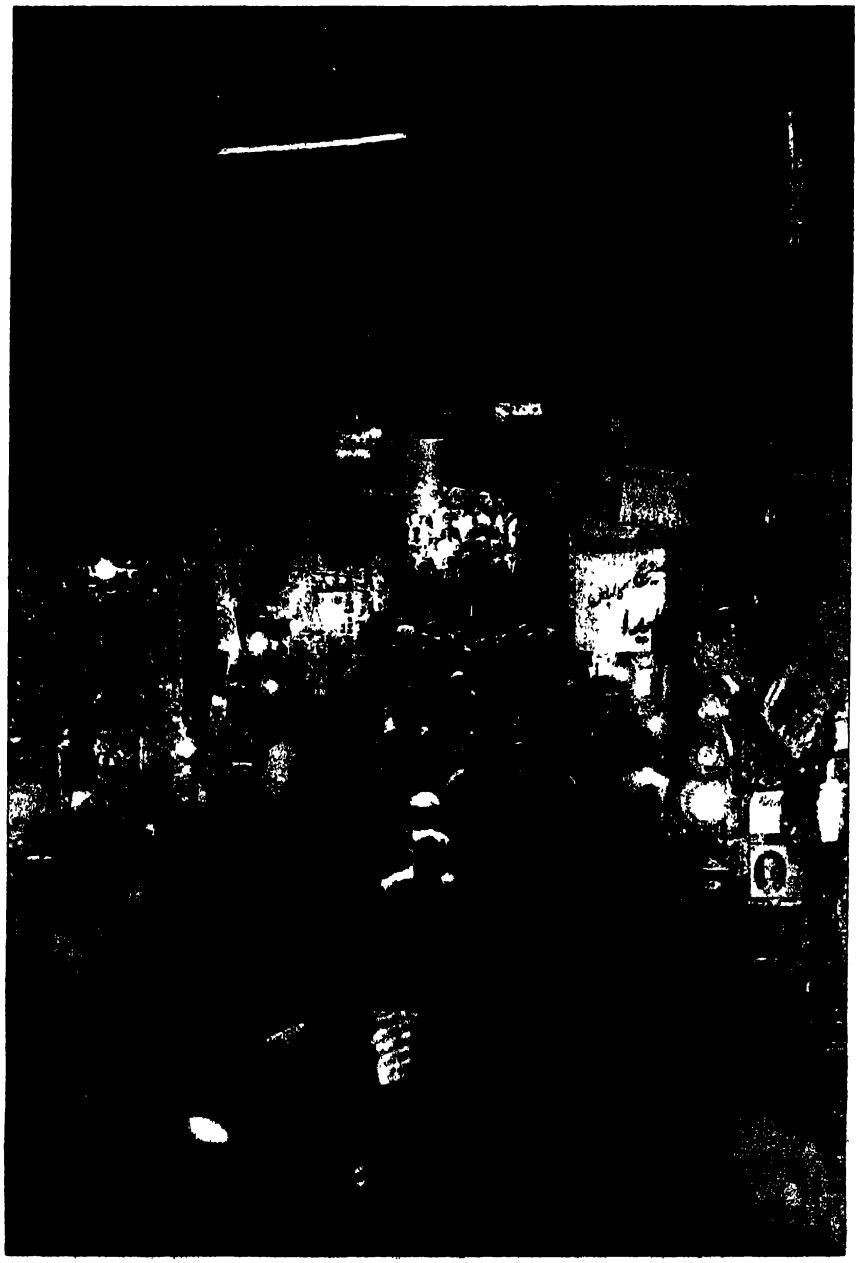
"Another America" (November 19) gave a matter-of-fact account of the situation in a much-acclaimed 'utopia'. However, the problems mentioned are not exclusively American. Any state's success depends on the extent of employment generation, which alone can eradicate poverty and give a sense of belonging to the people. One per cent of the population holding 40 per cent of the national wealth is not a problem as long as every citizen is assured of a job. No economic system in the world seems to have realised this.

Pushpendra Singh

Rewa, Madhya Pradesh

Rumblings of a revolution

Iran is on the verge of a sea change.



KESAVA MENON
in Teheran

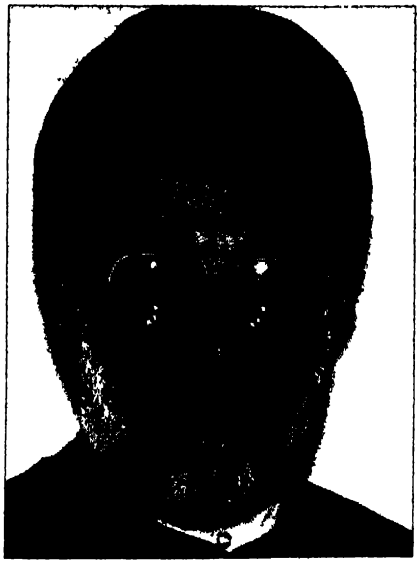
EVEN the most ardent of pro-changers in Iran will not admit that they smell a whiff of 1979 in the air. It is only hope mingled with fear about the course developments could take in the next few months that prevents them from acknowledging what every sense tells them is the objective reality. Nearly 20 years since the overthrow of the Iranian monarchy, the Islamic regime that took its place is fast losing its last shreds of legitimacy.

By February next year, the various tendencies jostling for supremacy within the clerical regime could finally acquiesce to the growing public demand for democracy, and effectuate a smooth transformation of the power structure into a truly democratic one. If developments take such a course, Iran can emerge as a liberal society enriched by a revolutionary morality. That is the hope. Alternatively, elements of the clergy whose interests are entrenched in the *status quo* could battle other clergymen and the vast majority of Iranians whose views they espouse. There is no small danger that some *status quo*ists would be prepared to destroy Iran in order to save the revolution. Therein lies the fear.

The objective reality in Iran today is that the Islamic Revolution as a political system has run its course. It is over. As a system where the higher echelons of the clergy directed the praxis of society with overwhelming support from the people, it no longer exists. The top clergyman continues to issue directives to the people and his loyalists are ready to silence those who show defiance. But they are no longer the vanguard of a revolution which draws sustenance from the people; only a junta clinging to dictatorial powers. The smarter clerics – the reformers – realise that the Iranian people have decided to take control of their own lives and that the clergy in this deeply religious society can best contribute through guidance and advice.

Three years ago, the position of the Wali Faqih (the Supreme Religious Jurisconsult), Ayatollah Syed Ali Khamenei, had seemed unassailable. It was impossible to find any Iranian who would openly criticise the Leader or even question the judgment he exercised in particular instances. There was some talk of differences in outlook between Khamenei and President Hojatolleslam Ali Akbar Hashemi Rafsanjani but it was not only politically incorrect but revolutionary anathema to talk of any split or duality in the clerical hierarchy. It was no secret that there were different tendencies within the clerical establishment but there was a sustainable myth that the clergy would successively resolve their differences and do so in the interests of Iranian society as a whole. This often went beyond the level

JEROME DELAY AP



Shoppers at a Teheran souk. Over 70 per cent of Iranians now want their society to be pluralistic and multi-sectoral.

f mere pretext. Most Iranians seemed repared to make the effort to believe that ıey were participants in a process and also omponents of a system uniquely esigned for Iranian needs.

Today even the mildest of controversial statements by Khamenei invites a barrage of criticism in the liberal press. In the public regard, he often comes across as a fool and sometimes as a charlatan, while Rafsanjani is almost universally considered a ruthless and amoral politician. Hard-core conservatives, such as the Janatis and the Yazdis who were once admired for their anti-imperialist boldness, are now feared for their fanaticism. The language used against the conservative clergy, whether the conversation takes place in private, in offices or in the street, is usually strong, often unprintable. As for the Vilayat-e-Faiqh – the post-revolutionary system wherein the Wali Faqih is the ultimate source of authority – the dominant opinion is that it must transform itself into something like a constitutional monarchy if it is to continue to have any relevance. The "Us-Them" duality is the fundamental precept in the Iranian political lexicon now.

Until recently, it was difficult for an external observer to assess concretely the balances within the Iranian system. Right from the beginning of the revolutionary epoch, it has been evident that there were a host of competing tendencies within the establishment. Different viewpoints on civic, economic, strategic and social issues were fused with ideological teachings from all manner of sources and the whole was further catalysed by the tenets of Islam to produce a smorgasbord of political agendas. But all this was within an establishment that was overwhelmingly clerical. Political agendas bereft of a scriptural underpinning were either banned altogether or allowed to rot in the margins. Now there is a fundamental change.

While the most prominent actors in the unfolding Iranian drama are garbed in clerical roles, they are merely actors, no more the playwrights. The dominant themes in the unfolding Iranian situation are now scripted by people outside the clerical establishment: liberal journalists who make their newspapers function like, and thereby substitute for, political parties; student, labour and professional groups, and the huge mass of working women and educated girls who find that the clerics' intellectual meanderings have no relevance to their sectoral requirements; and professors of theology like Souroush, "the Iranian Luther".

REUTERS

President Mohammed Khatami. His role in the new Iranian revolution has been to keep its pace steady so that too hasty a push does not produce a backlash.

When so many groups start articulating their separate aspirations, all at the same time, a cacophony could be expected. Paradoxically Iran is in a rather fortunate situation in this respect because each of these groups realise that they are in the initial phase of self-definition. If various institutions are to function in harmony, they have to set out the ground rules to demarcate their respective spheres. If emerging institutions have to work within their legitimate sphere, so do existing institutions. A net result is the demand that every social institution be limited to its appropriate and legitimate sphere. Since in the Iranian scheme of things until now religion was the social institution which subsumed all others, the common demand now is that the role of religion in society be henceforth restricted.

THE overall development has not been as neatly linear as set out above, but the point is that across a wide swathe of public opinion the majority demand is for restriction in the role of religion while only one segment stands for the *status quo*. This has resulted in the demarcation between the "us" and the "them". The demarcation might not have mattered much if the majority of the people had not been so obsessed with religion that they supported the "them" against the multitude of other institutions. But what became clear during the presidential election of 1997 and was subsequently re-confirmed by the elections to the local bodies last year, is that over 70 per cent of the Iranian populace now wants their society to be a pluralistic and multi-sectoral one.

There were elements within the clerical hierarchy – such as Syed Mohammed Khatami, Abdollah Nouri, Mousavi-Koeniha – who were able to respond to this fundamental change in public beliefs and aspirations. The leadership they have provided has been no small factor in this mass shifting of social aspirations. Khatami hammered away at the importance of the "rule of law" – that all systems and processes must function according to clearly established rules – during his election campaign of 1997. The "rule of law" was a euphemistic expression to convey that the various components of the clerical establishment – including the office of the Wali Faqih, and the constitutional and administrative bodies under his control – should be just as subject to the law as any other social institution.

Khatami's role in the new Iranian revolution has been to keep its pace steady so that too hasty a push does not produce a backlash. The job of pushing the envelope has been left to others and none has done it to such devastating effect as Abdollah Nouri, Managing Editor of the *Khordad* newspaper. Nouri made one foray after another into subjects not considered *kosher* by the dominant elements of the clerical establishment. Sections of the Koranic criminal code that provide for recompense to victims of aggression were questioned for their lack of contemporaneity. *Khordad* also published articles that expressed the views of the National Front for Iran and the Freedom Movement of Iran – organisations which had contributed to the overthrow of the Shah, but had subsequently been de-legitimised by the clergy. That was only the prelude.

Nouri was arraigned before a special clerical court on charges that the *Khordad* had published libellous material and spread lies. Himself a Hojatolleslam (a theological scholar whose grade is just below that of Ayatollah) and a member of the "family of the revolution", Nouri went before the court and blew up a virtual philosophical landmine beneath the clerical establishment. In a legal defence that is bound to become one of Iran's most important historical documents, Nouri blasted almost every single taboo which has constrained the nation. He questioned the legitimacy of the court; when told that its legitimacy was unquestionable since it had been set up by the Leader, Nouri retorted that the Leader's action was itself illegitimate since he had never been vested with limitless authority.

On relations with the United States, something that Khamenei rails against in and out of season, Nouri demanded to know why the issue could not be discussed exhaustively in public when secret parleys were going on. On relations with Israel, Nouri wanted to know why Iran must have such a closed mind when the Palestinians were beginning to look after their own affairs. On the house arrest imposed on Grand Ayatollah Hossein Ali Montazeri (Imam Khomeini's chosen successor until he was superseded by Khamenei) Nouri wanted to know why one of the most important religious scholars in the country was being denied the right to communicate with his fellow citizens. On the National Front and the Freedom Movement, Nouri wanted to know why they were proscribed when the Imam himself had praised their contribution to the Revolution.

Nouri was sent to jail for five years and banned from practising journalism for another five. But by the time he had finished, he had set off a philosophical earthquake. A week later, its tremors were shaking Qom, the citadel of the Ayatollah's power. Leading theologians had joined publishers, students, academics and ordinary citizens in questioning the legitimacy of not just the court which tried Nouri, but the entire establishment that it had come to represent. When the revolutionary establishment punished Nouri, one of the intellectual firebrands who had helped create it in the first place, it exposed itself as a beast which devours its own offspring.

THE mistakes committed by the *status quo*ists have contributed as much to the decline of their standing as the attacks by the pro-changers. At almost every stage of the confrontation that has been going on since Khatami's election, the conservatives have opted for iron-hand methods. Their refusal to confirm some of Khatamis choices for the Cabinet, or endorse the impeachment of others were among the milder rebuttals of the conservatives. To the Khatami Government's efforts to make the national debate as wide as possible by liberally issuing licences for new publications, the conservatives retaliated by using the plethora of courts at their command to close one after the other.

Several secular but moderate intellectuals were killed by a group of supposedly "rogue" intelligence operatives. Enquiries into the killings have not been concluded but dark rumours abound that the killings were pursuant to *fatwa*s issued by conserv-

HASAN SARBAKHSHIAN/AP

Abdullah Nouri, Managing Editor of the *Khordad*, who was sentenced to five years in prison by a special clerical court on November 27 for spreading "anti-Islamic propaganda".

ative theologians. Students protesting against the closure of a liberal newspaper were set upon by the Ansar-e-Hizbollah, the conservatives' strong-arm brigade. While several of the protesters were sentenced to imprisonment, not a single Ansar has been punished for the murderous assault. Ansar chieftains are openly talking of procuring arms to "defend the revolution", and there is no indicationthat any action will be taken against them.

In earlier instances the conservatives could fall back upon the Leader, whose stand on various issues was left ambiguous. This enabled Khamenei to step in and sort out differences whenever the conservatives boxed themselves into a corner. Khamenei's interventions almost always helped the conservatives, but not to such an extent that he lost all legitimacy to mediate on the other side. But of late, Khamenei had begun miscalculating, and not surprisingly, his impartiality was exposed to be a hoax in the Nouri trial.

Iranian conservatives are today on a slippery path to nowhere. Some of them genuinely believe that the viewpoints they espouse are sanctified by religion. Others have a vested interest in maintaining the *status quo* since they have reaped the monetary benefits the revolutionary set-up has thrown their way. Whatever their motivation, they realise that they are set against the tide of history, and their only real hope now is that a flash-flood of violence will somehow stymie the inevitable. There is genuine fear amongst the reformers and the public that the conservatives will provoke a violent confrontation, and that too, very soon.

Time-wise there is a definite span within which the Iranian developments have to pan out. Parliamentary elections are due on February 18, 2000 and it is almost a foregone conclusion that with the momentum so much in their favour the reformists will sweep the slate. Once, or if, they do, they are certain to transform completely the clerical establishment even if they do not legislate it out of existence.

For the moment the conservatives can draw relief from the fact that they control the apparatus, the Council of Guardians, which decides who should be allowed to stand for election. But this power is also limited in practical terms because if the conservatives do prevent the pro-changers from putting their first, second or third choice candidates on the ballot paper the turn-out will be so poor as to make a mockery of the electoral process. Large-scale abstention from the ballot booths will be just another indictment of the conservatives' illegitimacy.

The next two months will be testing times for Khatami. There are murmurs of dissent within the pro-changer ranks, especially among the students, at his perceived pusillanimity. The more ardent among them feel that Khatami should have been far more outspoken in his critique of the conservatives. The President has so far succeeded in counselling the dissenters that patience will bring its rewards; he has enough supporters among the sober-minded citizenry to help him hold the ranks together.

As one leading woman pro-changer put it, the current situation in Iran could be seen in either of two metaphorical terms. It could either be viewed as a huge pool of petrol waiting for a spark. Or it could be seen as a balloon which can be blown up some more before it reaches the bursting point. Either way an explosion looks inevitable unless some inconceivable outlet can be found to let out the pressure.

So far, the clerics of the *status quo* have not bent to the ideas of the reform advocates. The conservatives' belief in the legitimacy of violence could lead to a blood-bath. If so, they will only prolong the death throes of the Islamic revolutionary system. Something even more profoundly disturbing for the religious hardliners could happen sooner than they think. Beneath the sober commentary and grim analysis there is another sound to be heard on the streets – the sound of bubbling laughter. The tragedy that the Revolution has now become could in time be turned into a farce by the people. ■

A message in Malaysia

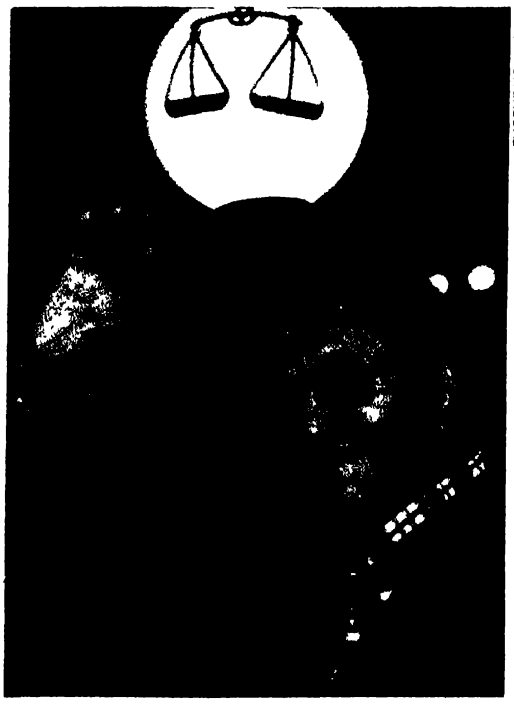
The ruling coalition headed by Mahathir Mohamad secures a two-thirds parliamentary majority in the Malaysian general elections, but concedes some ground in the Malay heartland to an Islamist party.

P.S. SURYANARAYANA
in Kuala Lumpur

MALAYSIA'S long-reigning Prime Minister, Dr. Mahathir Mohamad, has overcome the challenge of the incumbency factor and led his party to a two-thirds majority in the 193-member Parliament. The timing of the tenth general elections, held on November 29, was Mahathir's choice, but the campaign was dominated by the Opposition's calls for political reforms. The polling took place in the glare of unprecedented international scrutiny that was laced with the moral sympathy of the West for the cause of political reforms.

Mahathir's sense of vindication is, however, moderated by a wake-up call of sorts. Beginning his fifth consecutive term as Prime Minister, Mahathir faces a new challenge: that of arresting the rise of political Islam. Mahathir is known for his ability to manage skilfully a multiracial political coalition in a society that is characterised by religious pluralism; he is well-placed to stem the "green tide". That political idiom describes the growing political influence of the Parti Islam Se Malaysia (PAS), which made spectacular gains in the elections. But there is more to this than meets the eye.

In the post-election situation, given the perception that the PAS has seized the heartland of the majority Malays, ideologues in the ruling Barison Nasional (B.N.) alliance have begun to see the need for a reality check. The widespread belief is that there is much disenchantment with the United Malays National Organisation (UMNO), first among equals in the 14-party ruling coalition. The PAS' political gains in this election are seen to be linked to UMNO's suspected alienation from sections of the Malay community. The PAS is also believed to have acquired political respectability on account of its association with a high-profile elitist Opposition group that is campaigning for reforms – the party that derives inspiration from Anwar Ibrahim, the imprisoned former Deputy Prime Minister.



In the run-up to the elections, the main question was whether the 9.7-million Malaysian voters would opt for a paradigm shift away from 'Mahathirism' – a mix of nationalistic and pragmatic policies that stood for an economic revival without running to the International Monetary Fund for help, and an Asian dose of political liberalisation with an emphasis on the core values of peace and order. Two front-ranking Opposition units – the Parti Keadilan Nasional (PKN), led by Anwar's wife, and the Democratic Action Party (DAP) – in particular, campaigned for a vote against 'Mahathirism'. But a paradigm shift of a different kind may now take place unless Mahathir is able to reverse the PAS' entry into UMNO's citadel.

These trends, although discernible, are not self-evident in the election results. Of the 193 seats, the ruling B.N., which includes UMNO and the minorities-oriented Malaysian Chinese Association (MCA) and the Malaysian Indian Congress (MIC), secured 148 seats, constituting a two-thirds majority. Of the 45 other seats that went to the Opposition, the regional Parti Bersatu Sabah won three, while the remaining 42 seats went to Barisan Alternatif (B.F.), a new four-party Opposition grouping. Within the B.F., the Anwar-inspired PKN secured just five seats; the DAP, which is known to have support among ethnic Chinese and among people of Indian ethnic stock, won 10 seats. The lion's share of the B.F's gains went to the PAS: the party won 27 parliamentary seats and can now lay claim to the post of Leader of the Opposition, so far held by the DAP.

The real measure of the PAS' success is the fact that it retained power in decisive fashion in the State of Kelantan and won comprehensively in the oil-rich State of Terengganu. The PAS has made headway in the Prime Minister's home State of Kedah too, but it has not done well enough to capture power there. Even taken together, these do not amount to an Islamic fundamentalist "menace" to the marginally Muslim-majority Malaysia. However, the PAS has, while making gains in the State elections, eroded UMNO's traditional support base at the level of the parliamentary constituencies.

If the B.N. still managed to secure a two-thirds majority – winning, as Mahathir pointed out, more seats than it did in 1995, when it won 132 seats – it is probably because of the demographic matrix of the national constituencies. According to initial estimates, the B.N. won about 56 per cent of the popular vote, and the B.F. about 41 per cent.

Ahead of the elections, the Opposition parties had accused the Mahathir Government of gerrymandering in order to benefit UMNO. Independent estimates have it that the ethnic Chinese, who constitute about 28 per cent of the population, could

Prime Minister Mahathir Mohamad after his victory on November 30. He now faces the new challenge of arresting the rise of 'political Islam'.

ANDY WONG/AP

Supporters of the Parti Islam Se Malaysia (PAS) at an election rally in the northern State of Kedah. The party won 27 seats to become the biggest Opposition bloc in the new Parliament.

have influenced the result at best in 12 or 13 constituencies. Malay Muslims make up about 55 per cent of the population. Ethnic Indians, who are mostly Tamils but who also include people of Telugu and Malayalee origin, account for less than 10 per cent: they are in no position to tilt the scales in any single constituency.

WILL the elections and the verdict make a difference to how Malaysia is ruled? Harold Crouch, a scholar, had concluded in the mid-1990s that "the Malaysian electoral system has been organised in such a way that it would be difficult for the Opposition to defeat the government." But he argued at the same time that "the electoral process in Malaysia does contribute in an important way to making the Malaysian government responsive, to some extent at least, to pressures from the community." The question now is whether the "pressures from the community" on the government will centre on the need for political reforms, or rather the need to arrest the perceived rise of political Islam.

A view that prevails among UMNO ideologues is that the party, which has under Mahathir visualised the gradual emergence of "Bangsa Malaysia" or a pan-Malaysian nation subsuming but not negating the plurality of ethnic identities, should now guard against being soft on the Islamisation of politics, to the point of alienating the Chinese and the Indians and the parties in the B.N. fold that represent their interests.

The campaign this time was lacklustre; both the B.N. and the B.F. banked heavily on the support of the "silent majority" to see them through. In such a situation, the interpretation of the results has become much more dicey than at any time before. The near-collapse of the "Anwar phenomenon" as an election issue, despite his tactical refusal to be nominated as a candidate, disheartened the reformist sections of the Opposition. An Anwar loyalist, Chandra Muzzafar, said that he felt saddened by the possibility that the verdict "may well mean that Anwar will slowly recede into oblivion".

Relevant to the new context of Opposition unity is an earlier assessment of Anwar by Jomo K.S., an academic who recently filed a lawsuit challenging the alleged denial of voting rights to nearly 700,000 potential voters (many of whom were thought to be Anwar's supporters) by not registering them in time. In focus in this context is Anwar's "remarkable success in preserving his Islamic reputation despite making various compromises" during his association with UMNO.

At a different level, Malaysian political commentators such as M.G.G. Pillai argue that Mahathir may come under increasing pressure from within the ruling elite, if steps are not seen to be taken to retrieve the core ground that UMNO is seen to have lost to the PAS in the Malay heartland. ■

V.S. SAMBANDAN
in Colombo

THIRTEEN candidates have joined the presidential race in Sri Lanka, but the high-decibel contest is only between President Chandrika Kumaratunga and United National Party leader Ranil Wickremasinghe.

The campaign that is under way, is marked for the signals the two leaders send to the masses and the implications of their vote-catching slogans on the island's future political course. An issue that has dominated the political agenda of the two main rivals is the resolution of the ethnic conflict. The outlook of the two candidates on the military aggression between the security forces and the Liberation Tigers of Tamil Eelam (LTTE) could tilt the scales in the December 21 election to the Executive Presidency. Actually there is no wave in favour of any candidate.

In a clear shift from the 1994 election, the overwhelming support Chandrika Kumaratunga enjoyed at that time no longer exists. Left with mere blocks of votes, Kumaratunga and Wickremasinghe have to contend with the task of mobilising more support to expand further on their respective constituencies.

AN estimated 11.7 million voters are to exercise their franchise. The major groups include Sinhalese, Sri Lankan Tamils, plantation Tamils and Muslims. According to the latest statistics released by the Central Bank, Sinhalese constitute 74 per cent of the island's 18.55 million population. Sri Lankan Tamils constituting 12.6 per cent, Indian Tamils at 5.5 per cent and Moors comprising 7.1 per cent are the other major ethnic groups.

By religion, Buddhists constitute 69.3 per cent of the population, followed by Hindus (15.5 per cent), Muslims (7.5 per cent) and Christians (7.6 per cent).

In 1994, there was a cross-community backing for Kumaratunga's candidature as there was an island-wide euphoria in favour of peace. The response was particularly high in the northeastern area, which has a population of about 2.76 million.

Three weeks ahead of the election, there is an overall sense of dismay and cynicism over the polity and the approach of the political players to the issues confronting the nation.

The Sinhala vote, which has always seen a two-way split, is being sought by 12

A tough presidential race

The campaign for the presidential election in Sri Lanka hots up although there is an overall sense of dismay over the approach of the political players to the issues confronting the nation.

of the 13 contestants. Needless to say, the main tussle will be between three Chandrika Kumaratunga, representing the People's Alliance (P.A.), Wickremasinghe and Nandana Gunathilaka, a politburo member of the Janatha Vimukthi Peramuna (JVP). The JVP's entry into the fray makes a consolidation of the Sinhala vote a harder grind; this means that there is essentially a three-way split in the majority vote. Consequently, the main players have to either go all out to assuage Sinhala sentiments, or ensure that the majoritarian sensibilities are not ruffled.

The sense of alienation felt by the country's largest minority group, the Tamils, and the indications that they are not keen on exercising their franchise, provide the foundation for converting the election into an essentially southern (Sinhala) affair.

The mainstream Tamil political parties, which had initially exercised restraint, began in early December to spell out their stands. The former militant organisation have taken divergent positions on extension of support to either Chandrika Kumaratunga or Wickremasinghe. The Tamil United Liberation Front (TULF) called upon the Tamil voters to reject both the candidates.

The Eelam People's Democratic Party (EPDP), which has been appointed by the P.A. as its polling agent in the northern Jaffna peninsula, was the first to declare its position. Douglas Devanada, the EPDP chief, reposed faith in Kumaratunga and extended the party's support for her candidature. He said: "We are confident that the President will resolve the Tamil issue. It may not be possible to do it at once. It has to be done in stages. But we are sure that she will meet our hopes and aspirations."

The Tamil Eelam Liberation Organisation (TELO) has extended its support to Wickrem-asinghe, while the Eelam People's Revolutionary Liberation Front (EPRLF), like the TULF, has distanced itself from the main contestants. The EPRLF leaders said that the party would "support any party which genuinely attempts to find a lasting solution to the Tamil national question with the active participation of a third-party mediator." The party's secretary-general, Suresh Premachandran, said that the party did not have "the moral right to request the Tamil people to vote for either of the two main parties."

It is in this ambivalent background that the LTTE supremo, V. Prabakaran, made his annual Heroes' Day speech on November 27. He accused the Tamil parties of Sinhala chauvinism, and in a detailed charge against Kumaratunga, described her regime as "the worst form of tyrannical oppression" against the island's Tamils.

While this harsh attack against Kumaratunga has the possibility of translating a hardline Sinhala-Buddhist consolidation behind her, Prabakaran's undiluted stance on the issue of a separate Eelam is also bound to agitate the majority south. Kumaratunga has already started to capitalise on the proposals made by Wickremasinghe, which involved talks with the Tigers and providing for an interim administration by involving them. She has told the southern voters that such steps would lead to separation. A map showing the northeastern region in red colour, was splashed on the front page of a recent issue of a State-run daily, was a case in point. Whipping up passions against "a larger enemy" is considered an effective mechanism to consolidate the southern vote.

THE campaign across the southern parts of the island witnessed its share of election-related violence. There have been reports of organised attacks on political opponents, intimidation of party workers and party flags being damaged. The police announced stern action to stem possible violent turn of events.

For his part, the Acting Commissioner of Elections has introduced a code of ethics for the contestants. He has asked them to exercise restraint in their speeches.

With the two main contestants facing death threats, there is increasing concern about a possible assassination attempt ahead of the election. There is an indication that the LTTE would give a clear direction to the Tamil voters in the north and east.

Until now, the call has been restricted to "not to trust Kumaratunga". This does not necessarily mean "trust Wickremasinghe". But, if such a direction were to come, the going will be more difficult for the President.

In addition, concerns abound about possible rigging in the Army-held areas of the north and east as well as in the polling booths to be set up in government-held areas for Tamils living in rebel-held territory. Such concerns gave rise to calls for inviting foreign election observers.

The two main contenders find themselves heading for a photo-finish. But, as in any marathon race, there is still time. But predictably, the acts of the LTTE would largely determine the outcome. ■

The wooing game

In a changed perception of India, the LTTE leadership feels that whatever the past hostilities, there is no denying that India is the greatest friend of Sri Lankan Tamils, and by extension, of the LTTE.

D.B.S. JEYARAJ

ANTON STANISLAU BALASINGHAM, the 63-year-old political adviser of the Liberation Tigers of Tamil Eelam (LTTE), relocated clandestinely from the Northern mainland Wanni in Sri Lanka to Britain in the last week of May 1999. *The Hindu* was the first newspaper to report the move on June 9.

That report stated that the shift had two objectives. The first was to restructure the LTTE's international secretariat in London and spearhead a propaganda drive on a global scale. The second was to start initiatives seeking third-party mediation to revive negotiations between the Sri Lankan Government and the LTTE. Balasingham's health had been deteriorating, and it was expected that he would avail himself of the medical facilities available in Britain.

The past six months have seen Balasingham living quietly in London. While the Sinhala extremist fringe in Sri Lanka was demanding aloud that he be deported to Colombo, Balasingham adopted a low profile in London. He never appeared in public but engaged in quite a lot of political activity of the behind-the-scenes variety. It was, however, common knowledge among Tamil expatriates in London that Balasingham was in town. On November 27, Balasingham deviated from his low-key lifestyle and went public with a splash.

The occasion was Maaveerar Naal or "Great Heroes' Day". It has been the practice of the LTTE to observe November 27 each year as a day to remember and honour those Tigers who had fallen in battle. The first LTTE cadre to be killed was Sathiyanathan alias Shankar of Kambarmalai in Jaffna district. He died on November 27, 1982. After that more than 15,000 Tiger cadres have died in combat. The LTTE has observed the day since 1989 both in Sri Lanka and abroad. It is the most looked-forward-to event in the Tiger almanac.

A highlight of the day is an oration by LTTE leader Velupillai Prabakaran, described in LTTE jargon as an "address to the nation". As Prabakaran is an elusive personality and is not accessible to the media, his annual speech is seen as a barometer of the political mood of the Tigers. The speech receives wide publicity nationally and internationally. It is treated more or less as a policy statement of the LTTE. Aspects of the speech, such as brevity and ambiguity, gives rise to wide-ranging interpretations with regard to the current LTTE policy as enunciated by the numero uno.

THIS year, however, there was a difference. Anton Balasingham, referred to occasionally as an "LTTE ideologue" and "theoretician", was in London. He and his Australia-born wife Adele were the guests of honour at the Great Heroes Day ceremony held at the London Arena. A crowd of nearly 7,000 people participated. Balasingham addressed the meeting for nearly an hour. What he did was to amplify and clarify the policy of the LTTE as outlined already by the Tiger supremo. Owing to the difference in the time zones, Prabakaran's speech, relayed over the LTTE radio in the Wanni "Voice of Tigers", had been broadcast in the West before Balasingham spoke. The LTTE political adviser also made it clear that he had spoken with his leader before attending the meeting and had been briefed on what he had to say.

Thus Balasingham's speech was in a sense an elaborated version of what Prabakaran had said earlier. It was more explicit on fundamentals and devoid of the deliberate ambiguity that characterises Prabakaran's speeches. There were also significant departures, with Balasingham touching on areas where Prabakaran was silent.

One such issue was the LTTE's relationship with India. The LTTE, which used to indulge in rhetoric about its having defeated the world's fourth largest army, has been conspicuously silent on that in the recent past. Moreover, it has been consciously wooing India of late and has been trying for a rapprochement with the Bharatiya Janatha Party-led Government. (*Frontline*, July 30)

Balasingham's London speech outlined clearly the LTTE perception regarding India. The past decade has seen Tamil ultra-nationalists on both sides of the Palk Straits indulge in vitriolic outbursts against New Delhi on its alleged bias against Sri Lankan Tamils. The difficult situation had been aggravated by challenges to Indian "hegemonism". But in contrast, Balasingham's speech was markedly restrained and a complete departure from the usual anti-Indianism uttered by others in the past.

Balasingham's comments on India were stated within the context of assessing the possibility of any foreign intervention. Sections of the media in India have reported that Balasingham was referring to India as a potential mediator.

But actually nothing of that kind was mentioned. Instead, what Balasingham stressed was that there was no chance of India intervening on behalf of the "Sinhala" government in Colombo as had happened in the past.

The LTTE political adviser poohpoohed the anxiety on the part of some sections of Lankan Tamils that there would be foreign intervention in Sri Lanka against the LTTE. After dismissing such a possibility, Balasingham went on to say that the only country that mattered to the Sri Lankan Tamils was India. Their only concern was about Indian involvement. Whatever the past hostilities, there was no denying that India was the greatest friend of Sri Lankan Tamils, and by extension, of the LTTE. India *engal nesa sakthi* (India is our friendly or allied force), Balasingham said amidst thundering applause.

Referring briefly to the sorry history of conflict with the Indian Peace Keeping Force, Balasingham said that the LTTE actually had no intention of confronting India militarily then. *Indiavode motha engalukku enna paithiyamaa?* (Are we so insane as to confront India?) he asked. But owing to wrong advice given to Rajiv

Gandhi, the fighting was necessitated. The Sri Lankan Tamil people, who regarded India as "god", were subjected to much hardship as a result of that conflict. Now India herself has realised the deficiencies and mistakes of the earlier policy towards Sri Lanka, he said.

There was now a new dispensation led by the BJP. Balasingham was of the opinion that this regime was favourably disposed towards the LTTE. Political parties and leaders who were concerned about the Tamil cause in Sri Lanka were part of this BJP Government. As such Balasingham ruled out the possibility of the present Indian government intervening militarily on behalf of the "Sinhala" government in Colombo. "That will not happen," he said.

SRIYANTHA WALPOLA

Anton Balasingham, the LTTE leader who relocated to London in May 1999, with his wife Adele.

At the same time, there were some doubts and misgivings on the part of India that were preventing it from supporting openly the aspirations of Sri Lankan Tamils. This had to do with erroneous perceptions regarding the LTTE. One was that the LTTE would interfere in Indian domestic politics and foment dissension within the Indian Union. Balasingham categorically stated that the LTTE would never ever try to interfere in the domestic sphere of India. All that it was concerned about was the liberation of its people from oppression.

Another fear related to the demonstration effect that the formation of a Tamil Eelam would have on Tamil Nadu and the consequent possibility of secession there. This fear was baseless, said Balasingham. The objective conditions were different. In Sri Lanka, the Tamils were compelled to fight for separation because of the oppression. They were killed, bombed, and shelled by the government. That is not the case in Tamil Nadu. There is a State government of its own there. There are political parties. There is Kalaingar (a reference to Tamil Nadu Chief Minister). The State is prospering. Why should Tamil Nadu separate from India? There is no need to do so," said Balasingham.

After describing India as a friendly force, Balasingham went on to say that when Tamil Eelam becomes a reality, the fledgling state would be India's staunchest ally in the region. It would revolve within India's orbit. "I have been authorised by *thalaivar* (leader) to make this pronouncement. I hereby guarantee openly that we will not cause any problem to India and that we will remain the staunchest ally of India in this region," announced Balasingham to a wildly cheering audience.

APART from the "India factor" much of what Balasingham articulated was by way of amplifying what Prabakaran had said. There were, however, four areas where Balasingham, through his amplifications and clarifications, improved on what his leader had stated in his address. These related to the aborted attempts to conduct negotiations, the presidential election, the military aims of the LTTE and the potential for peace talks.

Prabakaran, possibly by design, was reticent and ambiguous on these matters, thereby causing contradictory interpretations of the LTTE position. But Balasingham, being more explicit in his speech, placed the LTTE position on these matters in a better and more enlightening perspective.

First, Balasingham revealed that contrary to Sri Lankan President Chandrika Kumaratunga's stated position that there would be no talks with the LTTE at this juncture, there had been three covert moves by her in this direction. Three channels had been made use of. "Bishops (he did not elaborate), Norway and the British Commonwealth Secretariat" were the emissaries, said Balasingham. The unacceptable aspect of these overtures was their clandestine nature, he said.

"Chandrika wanted secret talks in a foreign country within a short time-frame without anyone knowing. She did not want the Army, Cabinet Ministers and the people to know about these talks. Also, these were to be conducted without a ceasefire while the fighting was on. We declined because we did not want to do anything behind the backs of our people. Ours is a people's war. Whatever we do, it must be in the open and the people must be informed. Besides, while the war continues and our people get killed and maimed, how can we go to a foreign country, stay in plush hotels and talk pleasantly as if there was no war?" asked the LTTE ideologue.

Secondly, Balasingham spoke about the presidential election. (While Kumaratunga adopts a public position of being lukewarm towards the possibility of resumption of talks with the Tigers, the rival United National Party candidate, Ranil Wickremasinghe, has promised talks with the LTTE. This has led to the Kumaratunga camp accusing Wickremasinghe of striking a secret deal with the Tigers. There was also the expectation that the LTTE would indicate what Tamils are to do in terms of voting.) Balasingham dismissed specifically all talk about an understanding with the UNP. But he implied that Tamils should vote against Kumaratunga. What he said in essence was this:

"The past 50 years have seen the major Sinhala parties alternately discriminating against and deceiving the Tamil people. But as our leader said the last five years of Chandrika's rule have been the most terrible for Tamils. War, hunger, starvation, displacement, death, agony, and sorrow were everywhere. It had been a blood-stained, dark period. (Prabakaran was more severe in his speech calling it a curse on the Tamil people.) As far as elections are concerned they are to elect a new President for Sri Lanka. There is no practical benefit for the Tamil people. We are not concerned about this poll. It has not been our tradition to participate in such elections. We have no faith in them. In areas under our control there won't be any elections. But in other areas like Jaffna and

Batticaloa, the election will take place. The Tamil people there can do what they want.... They can vote for Chandrika or they can vote for Ranil. But there is one important thing that I must state here. If Chandrika comes to power again, it can only mean that the problems and hardships will continue. The tragic situation will prevail... We take no sides but the Tamil people know what to do."

Thirdly, on the military aims of the LTTE, Balasingham was boastful. He said that prior to the ongoing 'Unceasing Waves' campaign, there had been much pessimism about the military prowess of the Tigers. "Many Western nations thought the LTTE was a spent force. They thought Kumaratunga's 'war for peace' was succeeding."

"Even our own people were dejected. Jaffna was taken and the Army was advancing in the Wanni. 'What is the LTTE doing' was their question," said Balasingham. But Prabakaran was patient, he added. Preparations for the current operation had taken a year. There was intense training with live ammunition, resulting in several injuries during practice. Finally, the operation was launched. The martial ability of the LTTE was proved to the world. The ground situation has been transformed. Now there was a lull. But this was only to provide a brief respite to the cadres. The operation is 'Unceasing Waves'. Waves do not cease. They continue. We are yet to give *marunthu* (medicine) to *amma* (mother). The LTTE, according to Balasingham, was simply liberating the land from military aggression. The Wanni had been liberated but there were areas like Jaffna and Batticaloa. "We will go there also soon," said Balasingham amidst applause.

Fourthly, if liberation through armed struggle was the course of action, then what was the point in calling for talks? According to Balasingham, there are two reasons for doing so. Given the history, the LTTE does not trust any Sinhala government. The Tigers believe that the only durable solution would be a separate Tamil state – Tamil Eelam. It also does not believe that any government in Colombo could arrive at an equitable negotiated settlement. So the LTTE wants talks to expose the ulterior motives of the Sri Lankan government and prove to the world that no Sinhala government would grant Tamil rights.

There is also the need to avoid bloodshed and destruction. The LTTE, according to Balasingham, possesses the ability to drive the Army out of the Tamil areas. But it is offering an opportunity to the Army to withdraw peacefully. Before negotiations begin, a conducive climate must be created. For that the food embargo and restrictions on sending medical supplies to the Wanni and other areas must be removed. The Army of "aggression" must withdraw from the Eelam soil. Only then could meaningful discussions occur, Otherwise the war will continue and the Tigers will drive the Army away. Another important prerequisite for talks is that there must be third-party mediation. It could be a country or an international organisation.

GIVEN these "controversial" preconditions, there is scepticism over whether the LTTE is really keen on a negotiated settlement. But some analysts are optimistic. They feel that the Tigers are being maximalist in their stated pre-negotiation positions but could mellow if and when talks progress satisfactorily. In any case, given the obvious failure of Kumaratunga's war-for-peace strategy there is really no choice but to explore the possibility of talking to the Tigers, these sections feel. The presence of a third-party mediator could make a bindingly crucial difference this time, they say.

Others have their doubts, in view of the LTTE's track record. It would be another instance of the Tigers "talking" but not genuinely "negotiating", they say. Subjective and objective factors negate all chances of the LTTE ever coming into the mainstream of a "united" Sri Lanka, they say. Prabakaran's ideological commitment is firm and unwavering. Whatever Balasingham's semantics, in the final analysis that is the ground reality, they say.

That the LTTE wants to engage in talks with Colombo at the earliest has been made clear by another related development too. The Tamil United Liberation Front secretary-general and Member of Parliament from Trincomalee district, R. Sambanda, met Balasingham in London recently. The meeting was arranged through the efforts of the British authorities. It was held at the House of Commons building in the presence of a Labour Party MP. At that the meeting Sambanda called for a resumption of talks with the government. Balasingham shot it down saying that there was no point in talking just before presidential election. "Let the Sinhala people elect a new President and if that person genuinely desires a dialogue we can consider it with the aid of a third-party mediator," he said. So all indications at present are that talks will begin after the elections. ■

■ WORLD AFFAIRS

JOHN CHERIAN

MORE than two months after the Russian forces launched a full-scale assault on the secessionist government in Chechnya, the battle in the northern Caucasus is far from over. Although the Russian troops have encircled the Chechen capital, Grozny, fighting is raging in other parts of the province.

Grozny has virtually been reduced to a ghost town, battered by shelling and air raids. Eighty per cent of the city has been destroyed. Most of the civilians have left, but Chechen fighters are holed up in the capital waiting for the final Russian assault. Some Russian analysts are of the view that the military has no imminent plan to invade the Chechen capital. The Russian authorities do not want a repeat of the 1994-96 war when thousands of Russians were killed in the course of an assault on Grozny.

This time the Russian military's aim seems to be, in the words of a Russian commentator, to turn Grozny, slowly and methodically, into a "lifeless desert". With this goal in mind, Russian federal agencies are planning to cut off gas and electricity supplies to the Chechen capital. The Russian authorities are waiting for the civilian populace to evacuate fully from Grozny in order to implement these measures, and start non-stop artillery and air attacks on rebel positions there.

Chechen guerillas have engaged the Russian forces in fierce fighting during the two-month-old war. Russian authorities admitted that they have faced serious resistance from the guerillas. About 300 Russian soldiers have been killed, according to Russian Army officials. In the third week of November, a Russian reconnaissance patrol was ambushed and eliminated by a Chechen band. The going was comparatively easy for the Russian military in the first two months. Using air power to their maximum advantage, the Russian forces quickly seized the territory north of the Terek river, inhabited by Chechens traditionally loyal to Moscow. They also moved into Chechnya's lowlands from Dagestan and Ingushetia, on their way to Grozny.

With the harsh Russian winter having set in, the misery of the civilian population will grow. Civilians have been displaced in large numbers in what is officially described in Russia as an "anti-terrorist" drive.

The Caucasian cauldron

The Russian military offensive against secessionist elements in Chechnya reaches a critical point with the siege of Grozny and mounting pressure from the West to end the war.

Russian troops enter Achkhoi Martan, 25 km southwest of the Chechnyan capital of Grozny, on December 3. The Russian military, which has encircled Grozny, wants to convert Grozny into a mousetrap for the guerillas.

Western governments conveniently forgetting the havoc that the North Atlantic Treaty Organisation (NATO) airstrikes wrought on the civilian populace in Yugoslavia during the Kosovo conflict have been quick in condemning the Russian military action in Chechnya which is part of the Russian Federation. In the last week of November, the International Monetary Fund (IMF) and the Organisation for Security and Cooperation in Europe (OSCE) condemned the Russian offensive. Michael Camdessus the IMF Managing Director while addressing a workshop in Madrid said that negative reaction in the world to the events in Chechnya may put in doubt the question of extending Russia the IMF loans. The Chechen issue also occupied the centre stage in the OSCE summit in Istanbul where an attempt was made to make Russia the focus of criticism (see separate story). The West's blatant double standards has inflamed Russian public opin

IN the first week of December Russian Defence Minister Igor Sergeyev described the rebels' position as hopeless but at the same time said that it could take another three months to crush them. The IMF has made it clear that as long as the military campaign in Chechnya goes on, Russia cannot avail of IMF credit. The Russian economy is badly in need of fresh IMF funding and it is no surprise that the West is crudely using the monetary body to blackmail the Russian Government to ease pressure on the Chechens. The Western pressure may begin to have an adverse impact on Russia if it does not bring the assault to a swift conclusion. Russia's discomfort has made the Chechen guerilla leaders want to make the conflict as long drawn out as possible. They scoff at the Russian military's plan to convert Grozny into a mousetrap for them and claim that the Russian troops themselves would get trapped if they enter Grozny as the Chechen fighters will retreat into the nearby mountains and mount a military offensive from the rear.

UNTIL a decade ago, Chechnya was a prosperous land. After the Russians were defeated in a civil war four years ago, Aslan Mashkadov was elected President of the breakaway territory. He proved to be a weak leader and dismally failed to arrest the widespread anarchy. Smuggling and hostage-taking became the order of the day. Shamil Basayev, a terrorist, is the most influential Chechen leader now. His writ seems to run more than that of President Mashkadov. Basayev rose to international notoriety when he seized a crowded hospital in neighbouring Stavropol and held the patients and doctors hostage. He along with another warlord, Khattab, were responsible for the military intrusion into neighbouring Dagestan (*Frontline* October 8, 1999), which sparked the present Russian military action.

It is said that the Chechen people's fight for independence has been influenced to a large extent by the injustices inflicted on them in the 1930s and 1940s by the Soviet Union. The entire Chechen nation was uprooted in 1944 on charges of collaborating with the Nazi forces and resettled mostly in Kazakhstan, where they enjoyed the same rights as other Soviet citizens. After Josef Stalin's death, they were resettled in Chechnya and the Chechen-Ingush Republic was merged with the Soviet Republic. A secessionist wave gained momentum in the province in the late 1980s when it became clear that the Soviet Union was on its last legs.

Chechnya's economic potential is immense. Besides its own oil resources, the republic is a corridor for oil and gas pipelines for the entire region. The fate of many important projects to pump oil and gas from Azerbaijan, Turkmenistan and Kazakhstan depends on stability in Chechnya.

Chechnya's attempt to secede was spearheaded first by Dzokhar Dudayev, a former Major-General in the Soviet armed forces. In a sham election in 1991, in which only about 10-12 per cent of the Chechen population voted, Dudayev was elected President. Promptly thereafter, he demanded independence, and developed a well-equipped Army towards this end. But his push for independence was thwarted by the intervention of the Russian Army in December 1994. What followed was a bloody war that raged for 18 months and claimed thousands of lives on both sides. Dudayev himself was killed in the war. An agreement was signed between the Russian Government and the Chechen rebels in the summer of 1996. Under the agreement, the illegal Chechen paramilitary units were supposed to be disbanded and the federal forces withdrawn from Chechnya. A final decision on Chechnya's status was to be kept pending until the year 2001.

Moscow kept its part of the bargain and withdrew its forces from Chechen territory. But the Chechen guerillas started re-arming themselves with a vengeance and the "republic" became divided into zones of influence under the sway of warlords like Basayev and Khattab. Banditry and hostage-taking grew. In one instance, Chechen bandits stole 120,000 tonnes of oil from the Baku-Novorossiisk pipeline. Following this, federal authorities decided to close down the pipeline. The bomb explosions in Russian cities coupled with foolhardy incursions into neighbouring Dagestan were the last straw for the federal government in Moscow. The all-out offensive launched by the Russian army and air force is indicative of the mood of the political establishment in the country. The public response to the military initiative to bring the Chechen separatists to heel has been overwhelmingly favourable.

Prime Minister Vladimir Putin, who was a virtual non-entity when he was appointed Prime Minister, is the most popular politician in Russia today. Seventy per cent of the Russian population want him to be President. Yevgeni Primakov, who was the favourite until October, has slipped in the popularity ratings.

But these are still early days. The tide could turn against the Government if the war drags on and the casualties grow. But given the fragile health of President Boris Yeltsin, the war could yield tremendous political dividends for a lucky few. And Putin being Yeltsin's designated heir-apparent, at least for the time being, could turn out the luckiest. ■

A forum for European interests

The OSCE summit in Istanbul underlines the West's ambition to emerge as a watchdog of democracy and human rights.

BISWAJIT CHOUDHURY

RUSSIA is a member of the 54-nation Organisation for Security and Cooperation in Europe and naturally, the Russian military's drive against guerillas in Chechnya dominated the OSCE summit in Istanbul. President Boris Yeltsin's response to Western criticism was to leave the summit before it concluded, after making a strong defence of a war that has popular support in Russia. In the Chechnya offensive, the Russians, taking a leaf from the North Atlantic Treaty Organisation's book, (NATO successfully employed the strategy of air raids against Yugoslavia earlier this year) have relied on aerial bombings in addition to heavy shelling. The Russian action has caused more than 200,000 Chechens to flee their homes.

The Western criticism was mainly on account of the excesive use of force, which – as U.S. President Clinton advanced in the way of friendly counsel – could even be counterproductive, considering Russia's objective of eliminating Chechnya-based terrorism. Clinton urged Russia to seek a political solution and to allow the OSCE a role to mediate in its conflict with the rebel republic in the Caucasus.

At the end of the two-day summit, the final declaration, while reaffirming support to the territorial integrity of Russia, called for a political and humanitarian role for the OSCE in Chechnya. This and the fact that Russia has agreed to a visit by the OSCE Chairman to the war zone are seen as major concessions by Moscow, which previously rejected any outside involvement in the military campaign that began two months ago.

The case for an OSCE involvement in the Chechen conflict was reinforced at the Istanbul summit by the signing of a Charter for European Security. Russian Foreign Minister Igor Ivanov signed the document on behalf of Yeltsin who had left. The Charter reaffirms the OSCE's founding principles, which commit the members to, among other things, a broad spectrum of provisions on human rights and democratic freedoms. It declares the implementation of these principles to be the legitimate concern of all member-states and not exclusively the internal affair of any one of them. Without naming Chechnya, the Charter thus establishes the principle that conflicts in one signatory state are the legitimate concern of all. This is to be the basis of the role for the OSCE in the 21st century, in a security environment that has radically altered in this decade with the disintegration of the Soviet Union and Yugoslavia.

The OSCE as a multilateral arrangement is in some ways unique among the security institutions in Europe. Its 54 member-states represent a vast area, which includes continental Europe, the Caucasus, Central Asia and North America, "bringing together", as the organisation puts it, "the Euro-Atlantic and the Euro-Asian communities from Vancouver to Vladivostok." Turkey has been a member since 1973; the Central Asian republics, which were part of the Soviet Union, joined as independent members in the 1990s. The organisation qualifies as a regional arrangement under the United Nations Charter and is therefore the primary instrument in all phases of a conflict cycle, "from early warning and conflict prevention to crisis management and post-conflict rehabilitation in its region".

THE OSCE has its origins in what began in 1972 as the multilateral Helsinki Process, designed to further regular contacts between the participating states, which were mostly European and were members of either of the two confronting military blocs, NATO and the Warsaw Pact. The aim was to establish a permanent channel of communication,

DAVID SCULL/THE WHITE HOUSE/AP

Presidents Boris Yeltsin and Bill Clinton meet on November 18 during the OSCE summit in Istanbul. Clinton urged Russia to allow the OSCE a role to mediate in the Chechnyan conflict.

reduce the threat of war in Europe and open the prospects for East-West cooperation. Thirty-five countries, including the U.S. and Canada, were the original signatories to the Helsinki Act in 1975. The Act defined the multilateral process initiated and its comprehensive approach to security. Known as the Commission on Security and Cooperation in Europe (CSCE), the process was founded on the premise that security is indivisible and its various aspects – politico-military, economic and human – are interdependent. The CSCE, as a result, dealt with a range of issues, including arms control, preventive diplomacy, military confidence-building measures, human rights and economic cooperation, in the decades that followed its inception. Human rights, a sensitive issue between the blocs, was introduced as a legitimate subject of dialogue.

The idea of a pan-European conference first came from the Soviet Union in the 1950s as a way of confirming the existing borders in Europe and establishing a framework for East-West economic cooperation. But at that time, during the height of the Cold War, an idea that proposed a delinking of European and American security interests could not take off. It had to await the change in climate, which came about at the turn of the 1970s, with the East-West detente, the Strategic Arms Limitation Talks (SALT), and the Soviet acceptance of U.S. and Canadian participation. Neutral and non-aligned states in Europe, such as Yugoslavia and Cyprus had been more receptive to the idea.

In this sense, the Helsinki Process was an attempt at a qualitative change in the existing bipolar climate, determined by confronting military alliances, through a multilateral process that would involve neutral and non-aligned countries on an equal basis with the members of the two alliances.

The CSCE continued as a process without institutional structures until the collapse, in the 1990s, of the Communist regimes of eastern Europe radically changed European security concepts. The new environment, as well as the demands posed by new kinds of conflicts such as those in Yugoslavia, necessitated permanent structures, which the CSCE acquired on its way to becoming the Organisation for European Security. Its missions in Yugoslavia, however, proved too late and insufficient to prevent Europe's greatest military crisis since the Second World War. Yugoslavia's membership was suspended in 1992, by making an exception to the rule of consensus, on the grounds of human rights violations. On the other hand, the lack of international sanction for the NATO attack on Yugoslavia generated deep unease among the European public, and this was accentuated by imperialist penetration at times in the name of human rights.

Legitimation of the action by the U.N. came at the end, in the form of a U.N. role in concluding the war, and also a mandate for the multinational force now keeping peace in Kosovo.

This devastating break with half a century of peace has given a new urgency to stabilising the peace in Europe. The regions that are the most vulnerable are in the east where economic crises and social dislocations accompanied the fall of Communist regimes. In a bid to tackle the economic roots of the crisis, European countries have taken the lead to launch a Stability Pact for Southeastern Europe, aimed specifically at Bulgaria, Romania, and the countries that once formed the Yugoslav federation. The goals of the Pact are the establishment of Western-style democracies and vibrant market economies in these countries, advancing thereby their prospects of joining the European Union (E.U.). Bulgaria and Romania are trying to speed up negotiations for their entry into the E.U., while Hungary and Poland are at present associate members. Others, like the Czech Republic, are ahead in terms of the parameters that decide admission. E.U. membership would bring them the benefits of economic integration.

Among other aspirants for integration with the E.U., Turkey's case will perhaps be the most important in the beginning of the coming century. Turkey was turned down on different occasions since 1987 on grounds of it not measuring up to European standards in the matter of human rights and democracy, particularly in respect of its handling of Kurdish secessionism. Turkey has also had to contend with Eurocentric doubts about its identity as an Asian and Muslim nation. Turkey's location at the crossroads of Europe, West Asia and Central Asia, however, makes it a key player in all the big disputes in the region, now and in the future. It has a stake in the conflicts in the Balkans, the Caucasus, Iran, Iraq, and West Asia. It also has a long history of dispute in the Aegean and over Cyprus with Greece, a fellow member of the OSCE.

As the host, for the last major international summit of the 20th century, Turkey had an occasion to underline its importance. ■

Death of Hsing-Hsing

HSING-HSING, the United States National Zoo's giant panda who for more than a quarter-century served as diplomat, research subject and sweet-natured delight to millions, died in Washington on November 28. Zookeepers gave the panda a lethal injection after deciding that irreversible kidney disease had made his life too painful to endure.

RON EDMONDS/AP

Hsing-Hsing (prounounced Shing-Shing) was 28, an extraordinarily advanced age for a panda. He and his longtime female denmate, Ling-Ling, who died on September 30, 1992, at the age of 23 of sudden heart failure, were gifts to the United States from Mao Zedong in commemoration of President Richard M. Nixon's ice-breaking trip to China in 1972. The animals came to symbolise a deepening but still-testy relationship between the world's most populous nation and its wealthiest.

The pandas mated frequently, on their own and with the aid of science, but left no survivors. They produced five cubs between 1983 and 1989, but none lived more than five days.

National Zoo officials said that Hsing-Hsing's health deteriorated markedly in the last week of November. He was unresponsive to his keepers, nearly blind, plagued with advanced arthritis and barely able to rouse himself to eat. His final meal, on the night of November 27, consisted of a large blueberry muffin, boiled yams, a bit of rice broth and some bamboo.

"Yesterday, after three very bad days, we decided to euthanise him," said the zoo's associate curator for primates and pandas. "We feel an immense sadness as well as an immense emptiness, as empty as the Panda House is now." A spokesman at the Chinese Embassy in Washington said that he was "sad and sorry" to hear of the panda's death.

"The Chinese Government appreciates the effort and care shown by the National Zoo and for their assistance in the preservation of this rare animal," he said.

From the first day that Hsing-Hsing and Ling-Ling were put on display in April 1972, when 20,000 people flocked to the zoo to see them, the animals were a huge draw. Zoo officials estimated that as many as 75 million visitors saw one or both animals during their long run in captivity.

Ling-Ling, at the time of its death, was the oldest giant panda living in a zoo outside China. The life expectancy for giant pandas in the wild is 15 to 20 years.

National Zoo officials said that McKinley Hudson, the zoo's deputy director, approved the decision to put Hsing-Hsing down after several days of discussions. "It was a momentous decision," Hudson said. "But at the end he was not the Hsing we all knew and loved. In the long run, it certainly was the best decision for Hsing." Scientists were conducting a detailed necropsy on the panda. His skin and skeleton will be turned over to the Smithsonian's Museum of Natural History, which also has custody of his mate's remains. The bear's organs and tissues will remain at the zoo for future study, officials said.

Pandas have become a globally recognised symbol of the plight of endangered species, a cuddly poster animal embraced almost everywhere representing hundreds of less adorable plant and animal species.

The empty Panda House at the National Zoo was open on November 28, but the entry bore a sign reading: "We regret to inform you that Hsing-Hsing died this morning, Sunday, November 28, 1999." Inside, his glass-fronted den was half-covered with get-well cards from schoolchildren. ■

New York Times Service

Miss World

IT was a sort of "victory" for India. At a beauty pageant in London on December 4, billed the last Miss World contest of the millennium, 20-year-old Yukta Mookhey from Mumbai won the crown. The second and third places went to Martina Thorogood of Venezuela and Sonia Raciti of South Africa, respectively.

SEA

"It is the best day of my life because I had this as a beautiful dream as a child and now it's come true," swooned Mookhey, after beating 93 other aspirants. Besides the bejewelled crown, she won $100,000 and year-long globe-trotting opportunities.

Mookhey is the fourth Indian to be named the Miss World. Rita Faria was the first to win the title (1962), followed by Aishwarya Rai (1994) and Diana Hayden (1997). Sushmita Sen was chosen Miss Universe in 1994.

Mookhey said that her role model was Hollywood actress Audrey Hepburn, whose "inner beauty, compassion and great aura" she admired. Proclaiming herself as an "ambassador for India", she said: "In India we have a whole network of cultures and I want to spread those beliefs in tolerance."

Among others, the Rajya Sabha promptly rejoiced, with its Deputy Chairperson, Najma Heptullah, lauding Indian women for bringing laurels to the country. Members duly thumped in appreciation.

The zoology graduate who impressed the panel of judges with, besides other attributes, her quick replies to questions, had some harsh words for feminists. "I have little time for feminists who say doing this degrades a woman's dignity," she declared. Those protesting "would not object to watching an obscene movie on television." She was referring to a group of women's rights activists protesting outside the Olympia Theatre venue with placards saying, "stop this sexist cattle market", "women's bodies are not for sale" and "Miss World, we are not cattle, we will shut you down, just like Seattle." ■

Verdict in corruption case

ON December 2, Nagoor Meeran became the first former All India Anna Dravida Munnetra Kazhagam (AIADMK) Minister in Tamil Nadu to be convicted and sentenced for acquiring wealth disproportionate to his known sources of income. The judgment followed legal proceedings in three additional courts in Chennai conducted by the Directorate of Vigilance and Anti-Corruption (DVAC), Tamil Nadu. The DVAC filed charge-sheets against Meeran and his wife, Dr. Noor Jameela, on October 7, 1998.

V GANESAN

Special Judge S. Sambandham convicted each of them to three years' rigorous imprisonment and a fine of Rs.10,000. Meeran was found to have amassed the wealth between February 1992 and June 1996 when he was a Minister in the AIADMK Government headed by Jayalalitha. The DVAC found that Meeran had made Rs.33.72 lakhs. He was charged under Sections 13(2) read with 13(1)(e) of the Prevention of Corruption Act (PCA). His wife was charged under Section 109 (punishment for abetment) of the Indian Penal Code and Sections 13(2) read with 13(1)(e) of the PCA.

Meeran's total wealth as on February 1, 1992 was Rs.26,990. The value of property owned by him and his family members had shot up to Rs.43,56,343 by June 30, 1996. The ill-gotten wealth amounted to Rs.20.25 lakhs.

In his 64-page order, Judge Sambandham rejected Meeran's contention that he had earned the money through legal means and the defence argument that Rs.1.6 lakhs had been earned from coconut plantations and other crops grown on about 3.5 acres, which was bought for Rs.70,000 during the period in question.

The Judge suspended the sentences till January 27, 2000 to enable them to go on appeal in the High Court. After the Dravida Munnetra Kazhagam (DMK) returned to power in 1996, 46 corruption cases were filed against Jayalalitha, her former Ministers and bureaucrats. Three additional courts were set up in April 1997 to try these cases. Eight cases of corruption were filed by the DVAC and Crime Branch-Criminal Investigation Department (CB-CID) against Jayalalitha.

This is the second corruption case in which a Special Court has delivered its verdict. In the first order on November 26, Special Judge V. Radhakrishnan acquitted E. Hariharane, former Director of Fire Services, and Mohammed Ziauddin, an industrialist, of any wrong-doing in a case relating to the purchase of fire tenders by the Fire Services Department. ■

Cracking the code of human life

AFTER a decade of preparation, scientists have for the first time decoded the information in a human chromosome, the unit in which the genetic information is stored.

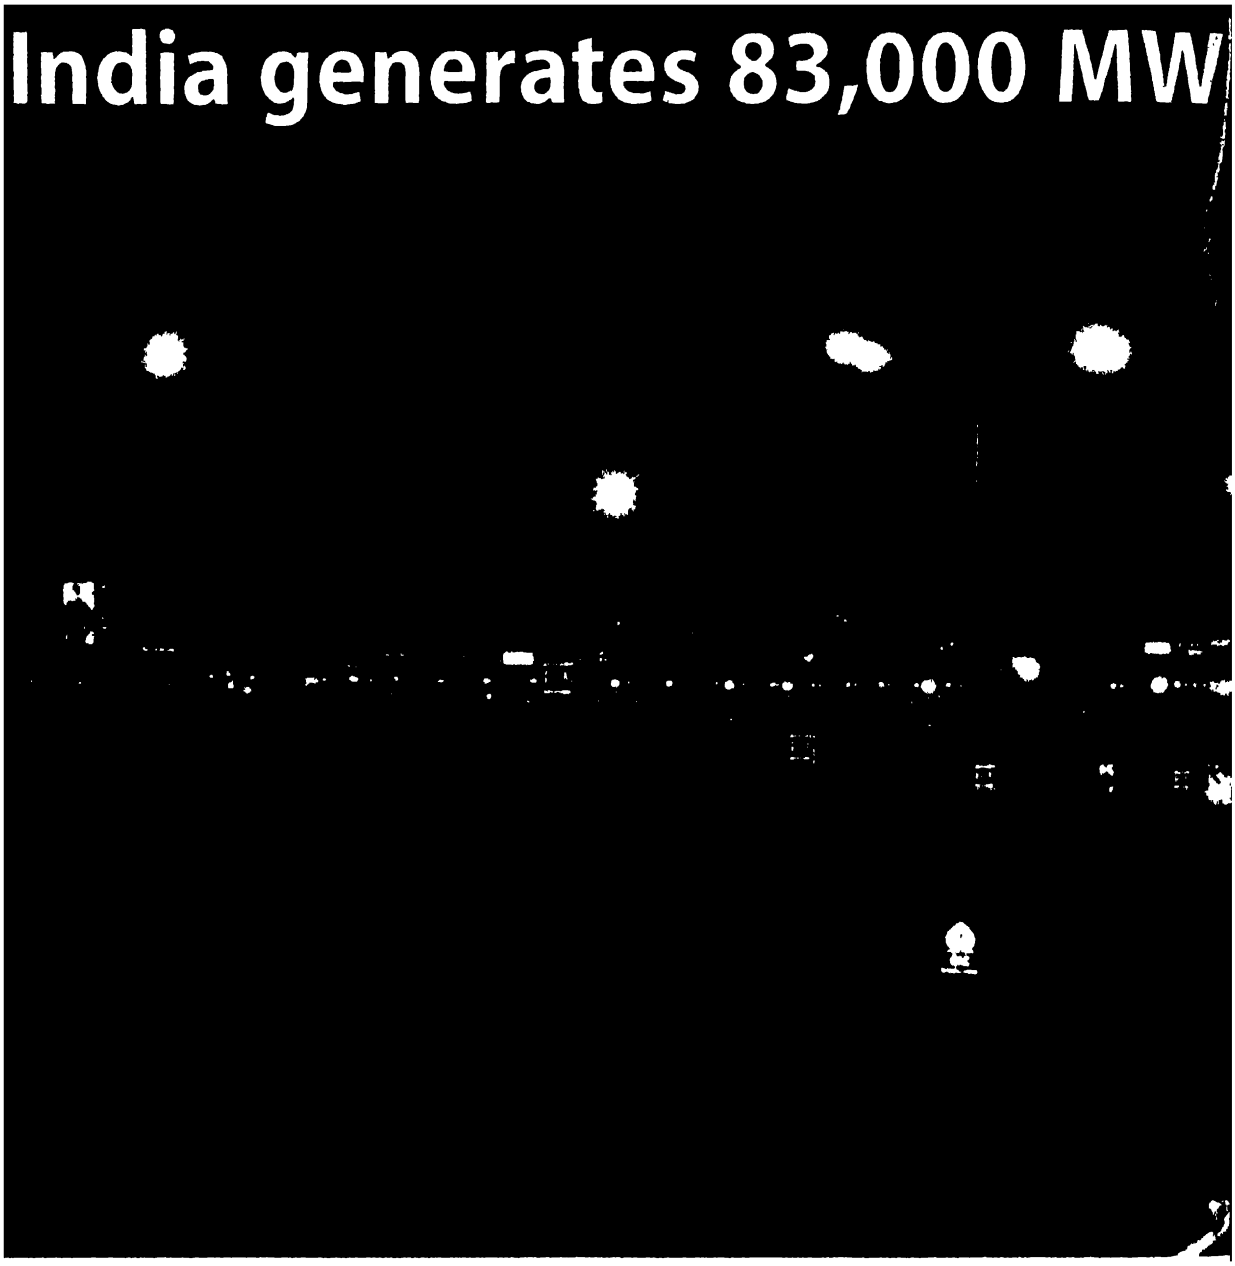
The achievement, significantly by a public consortium of university centres in Britain, the United States and Japan, is a milestone in the human genome project, an initiative started in 1990 with the goal of deciphering all of human DNA (deoxyribonucleic acid) by 2005.

The success in decoding the first chromosome, even though it is the second-smallest of the 23 pairs in every human cell, validates the approach chosen by the public consortium and bolsters the chance that it can complete the full human genome as planned. In the last 18 months the consortium's strategy has been challenged by a private company, Celera Corporation of Rockville, Maryland, U.S., which says it can sequence the genome faster by a different method.

"A new era has dawned – we have fulfilled the dreams of Mendel, Morgan, Watson and Crick, and Sanger, as we now have the essentially complete structure of the first human chromosome," said Dr. Bruce Roe of the University of Oklahoma, a member of the decoding team. He was referring to the principal architects of today's knowledge about genetics.

Understanding the human genome is expected to yield vast medical benefits, because almost every disease has a genetic component. The central feature of each chromosome is an enormously long DNA molecule. The chromosome on which the latest work was done is called Chromosome 22, which, small as it is, contains 43 million units of DNA, of which researchers have now decoded 33.5 million. Though there is still much left to be done, the Chromosome 22 team believes that it has sequenced all regions of major interest to biomedical researchers – that is, the regions that contain the protein-making genes.

The team working on Chromosome 22 also included scientists at Keio University in Japan and the University of Oklahoma. The team's leader is Dr. Ian Dunham of the Sanger Centre, where the bulk of the sequence was completed.



So far, the Dunham team has identified 545 genes – each of which is composed of thousands of chemical units – and altogether there are probably 1,000 or so genes strung out along the chromosome.

If there is a pattern in the types of genes nature has chosen to store on Chromosome 22, it has escaped the researchers. The genes appear to be a random assortment, including a large set of genes involved in the immune system and more than 20 genes that cause known human diseases when defective, such as DiGeorge and cat eye syndromes. In addition, one of the genes suspected of contributing to schizophrenia is believed to lie on Chromosome 22 but has not yet been identified.

Besides the interest in specific genes, biologists can also see, for the first time, the full architecture of a human chromosome. Their immediate reaction is, in some cases, pure awe at the daunting complexity of the structure and the distance yet to be travelled before its features are understood.

Although the goal of the human genome project is to sequence every one of the three billion letters in human DNA, the sequence of Chromosome 22 is not yet complete. There are 11 gaps, all of known length and fairly short. These are mostly regions that could not be cloned in bacteria, the standard way of amplifying long segments of human DNA for further analysis. ■

TCS Utilities solutions. Powering progress.

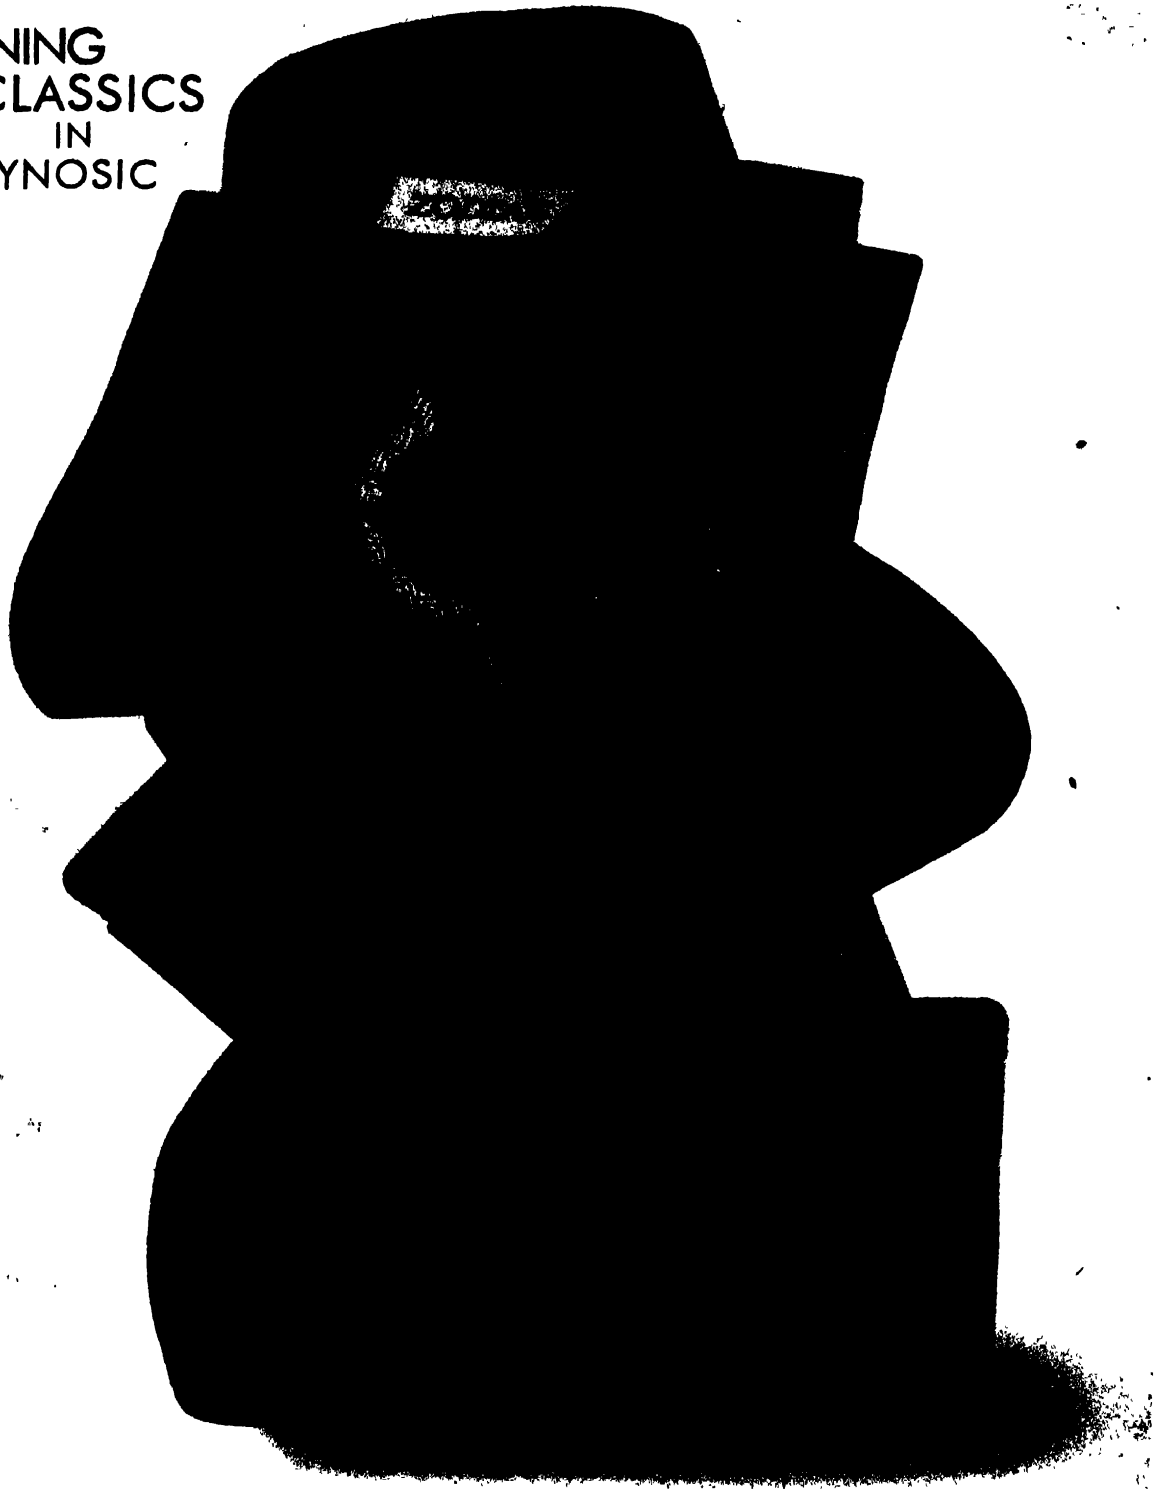
Nearly 20% of all power generated is lost in transmission. Can Information Technology empower the utilities industry to optimise its operations? At TCS we work hand-in-hand with the utilities industry to find answers beyond the obvious. Whether it is design, development and implementation of large new systems, web enabling of major existing systems, or creating scalable e-billing solutions to process transactions from millions

TATA CONSULTANCY SERVICES

Business Expertise: Finance • Telecom • Banking • Insurance • Manufacturing • Retail • Healthcare • Utilities • Government • Aviation Services • Disaster Management • Systems Management

consumers day after day. This consistent delivery of world-class
lutions has earned us the SEI CMM Level 5 certification Today,
lth over three decades of experience in the utilities industry we
ve the expertise to address your every IT need - from utility tariff
udies to material management systems. So if you want the power
Asia's largest software consultancy to work for you, get in touch
th us at <utilities@mumbai.tcs.co.in.>

- **Asia's largest systems consulting company.**
- **India's largest investment in software research.**
- **1,000 professionals across 50 countries.**



CS. Beyond the obvious.
